cumulative impact. Additionally, as discussed in this section, the project site does not contain riparian habitat or any other water resources. Additionally, the project site does not contain waters, including wetland waters, that are subject to federal jurisdiction under Section 404 of the CWA. The project site is not located within a designated protected area, which may support species and habitats that are sensitive and rare within the region or may function as a migration corridor for wildlife. Lastly, the Project would not conflict with any local policies or ordinances protecting biological resources. Therefore, with the implementation of MM BIO-1 through MM BIO-6, the Project would not contribute to a cumulative effect on biological resources including sensitive species, protected habitat, or wetland resources. Therefore, the Project would not contribute to a cumulatively considerable impact.

4.3.8 Mitigation Program

Standard Conditions

No standard conditions are applicable.

Mitigation Measures

MM BIO-1 **Rare Plant Mitigation Plan.** Parry's spineflower (CRPR 1B.1) is present on site and impacts are unavoidable; therefore, compensatory mitigation shall be provided to offset impacts. A rare plant mitigation plan shall be prepared and implemented by the applicant or its designee. The plan will demonstrate the feasibility of conserving, enhancing, or restoring Parry's spineflower habitat in areas to be managed as natural open space without conflicting with other resource management objectives. Habitat conservation, enhancement, or restoration will be at a minimum 1:1 ratio (acres conserved, enhanced, or restored to acres impacted).

If the rare plant mitigation plan proposes conservation of an extant population, the plan shall include at a minimum: (a) the location of the conserved habitat and an analysis of its suitability as compensatory mitigation; (b) an assessment of the extant Parry's spineflower populations at the proposed conservation site; (c) a long-term management plan which includes objectives, management practices, monitoring protocols, adaptive management strategies, and reporting requirements; and (d) details regarding the establishment of a non-wasting endowment to perpetually fund management of the conserved land, or such other funding mechanism acceptable to CDFW.

If the rare plant mitigation plan proposes enhancement or restoration, the plan shall include at minimum: (a) collection/salvage measures for plants or seed banks, to retain intact soil conditions and maximize success likelihood; (b) details regarding storage of plants or seed banks; (c) location of the proposed recipient site, and detailed site preparation and plant introduction techniques details for top soil storage, as applicable; (d) time of year that the salvage and replanting or seeding will occur and the methodology of the replanting; (e) a description of the irrigation, if used; (f) success criteria; and (g) a detailed monitoring program, commensurate with the plan's goals.

MM BIO-2 **Best Management Practices.** To avoid impacts to special-status resources and inadvertent disturbance, the following monitoring requirements and Best Management Practices (BMPs) shall be implemented:

a. Construction vehicles shall not exceed 15 miles per hour on unpaved roads adjacent to the project site or the right-of-way accessing the site.

b. The Applicant, or its contractors, shall screen, cover, or elevate at least one foot above ground, all construction pipe, culverts, or similar structures with a diameter of three inches or greater that are stored on site overnight. These pipes, culverts, and similar structures shall be inspected by the project biologist for wildlife before such material is moved, buried, or capped.

c. Construction activities shall occur during daytime hours to the greatest extent feasible. If construction must occur at nighttime, lights shall be oriented in such a way that they direct light downward and toward the active construction, ensuring that no direct light is emitted towards adjacent lands, and shields or deflectors shall be installed on lights to reduce light spill. Nighttime concrete pouring shall be performed in accordance with the City of Rialto Municipal Code.

d. A biologist shall flush special-status species (i.e., avian or other mobile species), with the exception of burrowing owl, from suitable habitat areas within the project development footprint to the maximum extent practicable immediately (e.g., within 24 hours) prior to initial vegetation removal activities. The biologist shall flush wildlife by walking through habitat to be imminently removed and towards adjacent open space.

e. At the end of each workday during construction, the applicant, or its contractors, shall cover all excavated, steep-sided holes or trenches more than eight inches deep and that have sidewalls steeper than 1:1 (45 degree) slope with plywood or similar materials, or provide a minimum of one escape ramp per 100 feet of trenching (with slopes no greater than 3:1) constructed of earth fill or wooden planks. The applicant, or its contractors shall thoroughly inspect holes and trenches for trapped animals each workday.

f. Contractors shall not permit pets on the construction site.

g. If trash and debris need to be stored overnight during maintenance activities, fully covered trash receptacles that are animal-proof and weather-proof shall be used by the maintenance contractor to contain all food, food scraps, food wrappers, beverage containers, and other miscellaneous trash. Alternatively, standard trash receptacles may be used during the day but must be removed or emptied each night.

h. To prevent inadvertent disturbance to areas outside the limits of work, the construction limits shall be clearly demarcated (e.g., installation of flagging or temporary visibility construction fence) prior to ground-disturbance activities, and all construction activities, including equipment staging and maintenance, shall be conducted within the marked disturbance limits. The work limit delineation shall be maintained throughout project construction.

i. The Applicant, or its contractors, shall avoid the use of invasive plant species in the associated landscaping.

j. Prior to initial ground disturbing activities, a Worker Environmental Awareness Program (WEAP) shall be prepared, which will include a training presentation and key fact sheet. The training will instruct construction crews to be aware of and recognize sensitive biological resources that may be encountered within, or adjacent to, the

project. The training will provide workers with instructions to follow in the event a sensitive species is observed or suspected to be on site. Biologists shall provide WEAP training materials, including but not limited to the key fact sheet, to construction personnel before their commencement of work on the project. Additionally, all construction staff shall attend the WEAP training presentation prior to beginning work on site. Upon completion of the WEAP training, each member of the construction crew shall sign a form stating that they attended the training, understood the information presented, and agreed to comply with the requirements set out in the WEAP training. Biologists shall provide updates relevant to the training to construction personnel during the safety ("tailgate") meetings, as needed.

MM BIO-3A **Burrowing Owl Preconstruction Surveys.** No less than 14 days prior to the onset of construction activities, a qualified biologist shall survey the construction limits of the project site and a 500-foot buffer for the presence of burrowing owls and occupied nest burrows. A second survey shall be conducted within 24 hours prior to the onset of construction activities. Time lapses between project activities greater than one week (7 days) would trigger subsequent 24-hour take avoidance surveys to confirm burrowing owl absence. The surveys shall be conducted in accordance with the most current CDFW survey methods. If burrowing owls are not observed during clearance surveys or biological monitoring, no additional conditions are required to avoid impacts to burrowing owl.

The Project Applicant shall submit at least one burrowing owl pre-construction survey report to the satisfaction of the City to document compliance with this mitigation measure. For the purposes of this measure, 'qualified biologist' is a biologist who meets the requirements set forth in the BUOW Guidelines (CDFW 2012).

MM BIO-3B **Burrowing Owl Preconstruction Surveys.** If burrowing owls, active burrows, or signs thereof are confirmed during any survey or biological monitoring, project activities with the potential to impact burrowing owl shall be immediately halted. The qualified biologist shall coordinate with CDFW and prepare a Burrowing Owl Plan that shall be submitted to CDFW for review and approval prior to commencing project activities with the potential to impact burrowing owl. The Burrowing Owl Plan shall describe proposed avoidance, and monitoring actions. The Burrowing Owl Plan shall include the number and location of occupied burrow sites, acres of burrowing owl habitat that will be impacted, details of site monitoring, and details on proposed buffers and other avoidance measures if avoidance is proposed. Project activities with the potential to impact burrowing owl shall not occur within 500 feet of an active burrow until CDFW approves the Burrowing Owl Plan.

If project activities, including occupied burrow exclusion and closure, could result in take of burrowing owl, the applicant shall coordinate with CDFW for appropriate CESA authorization (i.e., ITP under CFGC section 2081) prior to commencement of project activities with the potential to impact burrowing owl. The ITP shall describe, at a minimum, project activities and equipment, proposed avoidance/buffers, temporary and permanent impacts, monitoring, relocation and/or translocation, and minimization and compensatory mitigation actions. ITP compensatory mitigation will be fulfilled by one or more of following options: 1) purchase of credits at a CDFW-approved conservation or

mitigation bank (if available); 2) execution of a Mitigation Credit Agreement; or 3) Permittee-responsible mitigation land acquisition.

The conditions of the permit or measures outlined in the plan shall be adhered to by the applicant and any required compensatory mitigation of habitat would be provided.

MM BIO-4A **Crotch's Bumble Bee Surveys.** At a minimum, two pre-construction nesting surveys shall be conducted prior to project implementation. Surveys shall occur within 1) one week; and 2) within 24-hours prior to any vegetation removal or ground-disturbing activities scheduled to occur during the Crotch's bumble bee flight season (February through October). Surveys shall follow the guidelines provided in the CDFW's *Survey Considerations for CESA Candidate Bumble Bee Species* (2024b) and shall occur within the project site and areas adjacent to the project site where suitable habitat exists. The surveyors shall be qualified biologists familiar with Crotch's bumble bee identification and life history.

MM BIO-4B **Crotch's Bumble Bee CESA ITP.** Suitable Crotch's bumble bee habitat and Crotch's bumble bee presence has been confirmed on the site; therefore, a CESA ITP shall be applied for and obtained prior to the commencement of project activities with the potential to impact Crotch's bumble bee. The ITP shall include, at a minimum, a description of project activities and equipment, proposed avoidance/buffers, identification of temporary and permanent impacts, monitoring requirements, relocation and/or translocation protocols, and compensatory mitigation measures. Compensatory mitigation will be at a minimum 1:1 ratio (acres conserved, enhanced, or restored to acres impacted). ITP compensatory mitigation shall be satisfied by one or more of the following mechanisms: 1) purchase of credits at a CDFW-approved conservation or mitigation bank (if available); 2) execution of a Mitigation Credit Agreement; or 3) Permittee-responsible mitigation land acquisition.

MM BIO-4C **Crotch's Bumble Bee Biological Monitor.** A qualified biological monitor shall conduct full-time monitoring during removal of suitable nectar plants that is scheduled to occur during the queen flight period (February through March), colony active period (March through September), and/or gyne flight period (September through October). The monitor shall have authority to temporarily halt or redirect activities as needed to avoid unauthorized impacts.

MM BIO-5A **Nesting Bird Surveys.** To ensure compliance with California Fish and Game Code Sections 3503, 3503.5, and 3513 and to avoid potential impacts to nesting birds, vegetation clearing and ground-disturbing activities shall be conducted outside of the bird nesting season (generally February 15 through August 31), if feasible. Regardless of the time of year, a qualified biologist shall conduct a nesting bird survey within three (3) days prior to any disturbance of the site, including but not limited to vegetation clearing, disking, demolition activities, staging, or grading.

MM BIO-5B **Nesting Bird Surveys.** If active nests are identified, the biologist shall establish suitable buffers around the nests depending on the level of activity within the buffer and species observed. Buffer areas shall be avoided until the nests are no longer occupied, and the juvenile birds can survive independently from the nests. During construction activities, the qualified biologist shall continue biological monitoring activities at a frequency

recommended by the qualified biologist using their best professional judgment. If nesting birds are documented, avoidance and minimization measures may be adjusted and construction activities stopped or redirected by the qualified biologist to avoid take of nesting birds.

If nesting birds are not documented during the pre-construction survey, adherence to additional measures may not be necessary to avoid impacts to nesting birds.

MM BIO-6A **Special-Status Preconstruction Lizard Surveys.** Within 30 days prior to the commencement of any on-site project activities, a qualified biologist shall conduct pre-construction surveys in suitable special-status lizard habitat throughout the project site. Project-related activities that would result in ground disturbance include any construction, vegetation removal, and equipment and vehicle access, parking, and staging.

The qualified biologist shall have familiarity with special-status lizard species as recognized by CDFW. A minimum of one daytime survey during suitable weather for lizard activity shall be conducted by walking linear transects spaced to provide 100 percent coverage of suitable habitat. The location of any observed special-status lizards shall be documented. If feasible, the locations of any special-status lizards shall be avoided. Avoidance measures shall be monitored by the qualified biologist.

MM BIO-6B **Special-Status Preconstruction Lizard Surveys.** If pre-construction surveys are positive for coastal whiptail, coast horned lizard, or Southern California legless lizard and avoidance is not feasible, CDFW shall be notified in writing. In addition, relocation of all observed special-status lizard individuals shall be attempted and, if feasible, lizards would be relocated to the nearest available suitable habitat on conserved land in consultation with CDFW.

4.3.9 Level of Significance After Mitigation

Potential impacts to biological resources would be reduced to a level considered less than significant after implementation of the specified mitigation set forth in this section.

4.4 CULTURAL RESOURCES

4.4.1 Introduction

This section provides contextual background information on resources on or near the project site, including the area's prehistoric, ethnographic, and historical settings. The extent to which development of the proposed Project could impact existing historic or prehistoric resources is evaluated. A Cultural Resources Assessment was completed for the proposed Project by Kimley-Horn and Associates, Inc. in May 2024 and is included as **Appendix E** of this EIR.

Tribal cultural resources as defined in Public Resources Code Section 21074 (sites, features, places, cultural landscapes, sacred places, and objectives with cultural value to a California Native American tribe) are addressed in **Section 4.16: Tribal Cultural Resources**, of this EIR. Paleontological resources are addressed in **Section 4.6: Geology and Soils**.

4.4.2 Regulatory Setting

Federal Regulations

National Historic Preservation Act of 1966

Pursuant to the National Historic Preservation Act (NHPA) of 1966, as amended, the federal government, acting through the U.S. Department of the Interior's National Park Service, maintains an inventory of historic and archaeological resources — referred to as the National Register of Historic Places (NRHP) — that are worthy of preservation based on meeting certain criteria. The NHPA established the Advisory Council on Historic Preservation and provided procedures for the agency to follow if a proposed action affects a property that is included or may be eligible for inclusion, on the NRHP. The NRHP was developed as a direct result of the NHPA.

The NRHP was established by the NHPA of 1966, as "an authoritative guide to be used by federal, state, and local governments, private groups, and citizens to identify the nation's cultural resources and to indicate what properties should be considered for protection from destruction or impairment" (*Code of Federal Regulations* [CFR] 36 § 60.2). To be eligible for listing in the NRHP, a resource must be significant in American history, architecture, archaeology, engineering, or culture. A property (districts, sites, buildings, structures, and objects of potential significance) is eligible for the NRHP if it is significant under one or more of the following four established criteria:

- Criterion A: Associated with events that have made a significant contribution to the broad patterns of our history;
- Criterion B: Associated with the lives of persons significant in our past;
- Criterion C: Embody the distinctive characteristics of a type, period, or method of construction; represent the work of a master; possess high artistic values, represent a significant and distinguishable entity whose components may lack individual distinction;
- Criterion D: Have yielded, or may be likely to yield, information important in prehistory or history.

Eligible properties meet at least one of the criteria and exhibit integrity, measured by the degree to which the resource retains its historical properties and conveys its historical character, the degree to which the original fabric has been retained, and the reversibility of changes to the property.

Unless the property possesses exceptional significance, it must be at least 50 years old to be eligible for listing in the NRHP. In addition to meeting the criteria of significance, a property must have the integrity of location, design, setting, materials, workmanship, feeling, and association. Sites that meet one or more NRHP eligibility criteria but do not retain integrity are not eligible for the NRHP. Guidance regarding the integrity of location, design, setting, materials, workmanship, feeling, and association is provided by National Register Bulletin 15.[1]

State Regulations

California Register of Historic Resources (CRHR)

In 1992, Assembly Bill (AB) 2881 was signed into law establishing the California Register of Historical Resources (CRHR). The CRHR is an authoritative guide in California to be used by State and local agencies, private groups, and citizens to identify the State's historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change. Eligibility for the CRHR is determined by the California Office of Historic Preservation in a formal review process in which a resource is proposed for listing. A resource deemed eligible for the NRHP is typically deemed eligible for the CRHR. Certain resources are determined by the statute to be included in the CRHR, including California properties formally determined eligible for or listed in the NRHP, as well as State Landmarks and State Points of Interest. The CRHR is maintained by the Office of Historic Preservation's State Historic Preservation Officer.

For a historic resource to be listed, the resource must meet one or more of the following criteria:

A. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;

B. Is associated with lives of persons important in our past;

C. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or

D. Has yielded, or may be likely to yield, information important in prehistory or history.

California Public Resources Code

The Public Resources Code establishes the definition and criteria for historical resources. "Historical resources," according to Public Resources Code Section 5020.1(j), "includes, but is not limited to, any object, building, site, area, place, record, or manuscript which is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annuals of California." Section 15064.5(a) of the State CEQA Guidelines states that "[g]enerally, a resource shall be considered by the Lead Agency to be 'historically significant' if the resource meets the criteria for listing on the California Register of Historical Resources."

CEQA has established statutory requirements for the formal review and analysis of projects that fall under its jurisdiction. CEQA maintains that any property listed in, determined, or found eligible for listing in the CRHR is a "historical resource" and shall be considered historically significant. Pursuant to Public Resources Code Section 21084.1, a "project that may cause a substantial adverse change in the

[1] NRHP. 2002. *National Register Bulletin 15*. Retrieved from: https://www.nrc.gov/docs/ML1912/ML19120A529.pdf. Accessed September 12, 2024.

significance of a historical resource is a project that may have a significant effect on the environment." Public Resources Code Section 21083.2 additionally requires agencies to determine whether proposed projects would have effects on "unique archaeological resources."

Impacts to cultural resources are considered significant if a project (1) physically destroys or damages all or part of a resource; (2) changes the character of the use of the resource or physical feature within the setting of the resource that contributes to its significance; and/or (3) introduces visual, atmospheric, or audible elements that diminish the integrity of significant features of the resource.

The Lead Agency must concurrently determine whether a project will cause damage to a unique archaeological resource (as defined in Public Resources Code § 21083.2(b)) and, if so, must make reasonable efforts to permit the resources to be preserved in place or left undisturbed. An archaeological resource must be determined to be "unique" or "historic" for an impact to the resource to be considered significant. Section 21083.2(g) of CEQA defines a unique archaeological resource as an archaeological artifact, object, or site about which it can be demonstrated that without merely adding to the existing body of archaeological knowledge, there is a high probability that it meets any of the following criteria:

1. Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.
2. Has a special and particular quality such as being the oldest of its type or the best available example of its type.
3. Is directly associated with a scientifically recognized important prehistoric or historic event or person.

If a resource is neither unique nor historical, the effects of a project on that resource will not be considered significant effects on the environment (CEQA Guidelines § 15064(C)(4)).

California Health And Safety Code

California Health and Safety Code Sections 7050.5-7055 govern the process for reporting inadvertent discoveries of human remains to the County Coroner; the process for the County Coroner to report human remains of Native American descent to the Native American Heritage Commission (NAHC); and the protections offered against removal or desecration of human remains.

California Code of Regulations

The California Code of Regulations governs the nomination of resources to the CRHR (14 California Code of Regulations §4850). The regulations set forth the criteria for eligibility as well as guidelines for assessing historical integrity and other resources that have special considerations.

California Historic Building Code

The California Historic Building Code-California Code of Regulations, Title 24, Part 8- provides regulations for dealing with structures designated as historical buildings or properties. The California Historic Building Code provides solutions for preservation of these structures, promotes sustainability, provides disability access, provides a cost-effective approach to preservation, and provides for safety of occupants or users.

Local Regulations

Rialto General Plan

General Plan Chapter 7 *Our Roots: Cultural and Historic Resources Element,* recognizes that the "future of Rialto is linked strongly to its past." The following list includes General Plan goals and policies that have been adopted by the City for the purpose of avoiding or mitigating an environmental effect and are applicable to the proposed Project.

Goal 7-1 **Preserve Rialto's significant historical resources as a source of community identity, stability, aesthetic character, and social value**.

Policy 7-1.1 Protect the architectural, historical, agricultural, open space, environmental, and archaeological resources in Rialto.

Goal 7-3 **Identify, document, and protect significant archaeological resources in Rialto.**

Policy 7-3.1 Require archaeological surveys during the development review process for all projects in archaeologically sensitive areas where no previous surveys are recorded.

Policy 7-3.3 Avoid impacts to potentially significant prehistoric and historical archaeological resources and sites containing Native American human remains consistent with State law.

Policy 7-3.4 Reduce adverse impacts to significant archaeological resources that cannot be protected in place through data recovery excavations.

Rialto Airport Specific Plan

The Rialto Airport Specific Plan was adopted by the City in November 1997. The Rialto Municipal Airport ceased operations in 2014 and the former airport property and many of the properties adjacent to the Rialto Municipal Airport that were suited to accommodate development were removed from the Rialto Airport Specific Plan and incorporated into the Renaissance Specific Plan, which was adopted by the City in 2010. Although the Rialto Municipal Airport is no longer operational, the Rialto Airport Specific Plan serves as the zoning ordinance for parcels that were not removed; these parcels are primarily northwest, west, and east of the former Rialto Municipal Airport. The Rialto Airport Specific Plan also provides a framework to guide future land use and development decisions in this area. The Rialto Airport Specific Plan does not contain specific policies related to cultural resources.

City of Rialto Municipal Code

Municipal Code Chapter 2.20 establishes the Historical Preservation Commission. The commission is authorized to make recommendations, decisions and determinations concerning the designation, preservation, protection, enhancement, and perpetuation of these historical and cultural resources which contribute to the culture and aesthetic values of the City. Government Code Section 37361 empowers cities to adopt regulations and incentives for the protection, enhancement, perpetuation and use of such places, buildings, structures and other objects. The adoption of reasonable and fair regulations is necessary as a means of recognition, documentation, preservation and maintenance of resources of cultural, aesthetic, or historical significance. Such regulation serves to integrate the preservation of resources and the extraction of relevant data from such resources into public and private land management and development processes, and to identify as early as possible and resolve conflicts

between the preservation of cultural resources and alternative land uses. Chapter 2.20 is intended to carry out the goals and policies of the General Plan.

4.4.3 Existing Conditions

Natural Setting

The project site is situated to the southwest of the Cajon Pass, 2.5 miles southeast of the San Bernardino National Forest in the northwestern portion of the City of Rialto. On-site elevations range from approximately 1,612 to 1,649 feet above mean sea level; the site generally slopes from northwest to southeast on an approximately 2 to 9 percent grade. The City is largely urbanized and bordered by other developed areas; the setting surrounding the project site is primarily light and heavy industrial. Residential land uses are located east of Locust Avenue. Previous on-site land uses include a historic ammunition complex and stockpiling and storage activities. The project site has been heavily disturbed and currently vacant and contains vegetation noted as a mix of chaparral and non-native grasslands.

Historic Setting

Typical of many San Bernardino County towns, the area that would one day become Rialto was a fertile agricultural area due to the warm, dry climate. Southern California's citrus culture can be traced to the Mission San Gabriel; an orange grove was planted on mission lands in 1804. In 1841, William Wolfskill used seedlings from the San Gabriel orchard to plant his own larger orchard. Wolfskill is credited with establishing citrus commercially. Small ranching operations were established in the Rialto area in the mid-19th century. In 1887, the first railroad connection was established and the land that now comprises Rialto was purchased by the Semi Tropic Land and Water Company. The company named the community Rialto and began development in the area. Shortly thereafter, a group of midwestern Methodists immigrated to Rialto and furthered its development. By the late 19th century, Rialto was an agricultural community for which citrus was the main crop. In 1893, the community contained approximately 35 homes with 250 residents, a few local businesses, and the Hotel del Rialto. The first citrus packing house was built in 1894, and a citrus association was established.

Rialto was incorporated in 1911. Citrus agriculture was the most important industry to Rialto in the 20th century. Connections to improved transportation resulted in steady growth as the small agricultural community was able to expand the market for their local product. In addition to the Santa Fe Railroad connection, in 1914, Pacific Electric Railway completed the San Bernardino line through the City. Improved transportation through Rialto not only included the rail line but also the repaving of Foothill Boulevard (the main east-west transportation route) in 1913, which eventually became part of U.S. Highway 66, better known as the transnational Route 66. With these improved transportation connections, small local agricultural operations developed into a robust citrus packing industry.

The project site was vacant until the 1940s when the City expanded its infrastructure to support the war effort, when the U.S. Army built rail spurs and bunkers for weapon and ammunition storage. The ammunitions bunker area was over 2,000 acres of land located in the northern portion of the City that overlaps with the project site. The bunkers were abandoned after the war effort and used as a place for storing, manufacturing, and storing explosives until 1994.

Since then, the site has been mainly clear of any development with limited portions of the site used for additional storage by various facilities adjacent to the site. Site reconnaissance identified an empty

munitions bunker remaining from the U.S. Army use and two empty poly totes (**Appendix G1**).[2] The bunker as well as a small brick and mortar structure were observed at the southern portion of the L-shaped project site.

Native American Tribal Setting

Please refer to **Section 4.16: Tribal Cultural Resources**, of this EIR.

4.4.4 Methodology

An archaeological and historical records search was conducted at the South Central Coastal Information Center (SCCIC) of the California Historic Resources Inventory System on April 3, 2024, by Kimley-Horn, which included the project site and a half-mile buffer around the site. The search included a review of all recorded archaeological and built-environment resources as well as a review of cultural resource reports on file. A Sacred Lands File search for the project site and immediate vicinity through the Native American Heritage Commission was also performed. Historic aerial photographs and historic USGS topographic maps of the project site were consulted. Kimley-Horn Cultural Resources Management staff conducted a pedestrian survey of the project site on April 9, 2024. Transects were spaced approximately 15 meters apart and all surface exposures were inspected. Ground visibility ranged from poor to excellent, with graded/vacant areas having high visibility and densely vegetated areas having low visibility.

Where significant impacts remain despite compliance with the regulatory framework, feasible mitigation measures are recommended, where warranted, to avoid or reduce the Project's potentially significant environmental impacts.

4.4.5 Thresholds of Significance

The following significance criteria for cultural resources were derived from the Environmental Checklist in CEQA Guidelines Appendix G. The proposed Project would result in a significant impact related to cultural resources if it would:

- Cause a substantial adverse change in the significance of a historical resource pursuant to Section 15064.5.
- Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5.
- Disturb any human remains, including those interred outside of formal cemeteries.

4.4.6 Project Impacts and Mitigation

Threshold 4.4-1:	**Would the Project cause a substantial adverse change in the significance of a historical resource pursuant to Section 15064.5?** ***Level of Significance:*** Less than Significant with the incorporation of MM CUL-1 through MM CUL-5.

CEQA Guidelines Section 16064.5 defines "historical resources" as being a resource listed in or eligible for listing as a significant resource in State or local registers of historical resources, or by determination of a

[2] Phase I Environmental Site Assessment (ESA), Hazard Management Consulting, Inc., July 2023; **Appendix G1** of this EIR.

lead agency which is supported by substantial evidence. The fact that a resource is not listed in, or determined to be eligible for listing in the California Register of Historical Resources, not included in a local register of historical resources (pursuant to Public Resources Code § 5020.1(k)), or identified in an historical resources survey (meeting the criteria in Public Resources Code § 5024.1(g)) does not preclude a lead agency from determining that the resource may be an historical resource as defined in Public Resources Code Sections 5020.1(j) or 5024.1.

Kimley-Horn conducted a records search of cultural resources at the SCCIC for the project site plus a 0.5-mile buffer. The results of the record search indicated that three cultural resources have been previously recorded within the search area, with one historic age resource, CA-SBR-8696H, partially located within the southwestern portion of the project site.

The record search results also identified 12 cultural resource studies that had been completed within the search area, four of which include a portion of the project site. Three of the studies overlap with the project site and focus on cultural resource CA-SBR-8696H; no other resources were identified. The fourth study was conducted in 2007 and analyzed the same area as the project site. Again, the only resource identified was CA-SBR-8969H.

Resource CA-SBR-8696H is a historic-age resource originally recorded in 1996 and encompasses 2,822 acres including a World War II-era complex with 20 earth-covered bunkers, one of which is located within the boundaries of the project site and was given the resource name Rialto Military Munitions Bunker Complex. Upon review of previous reports and site records, it was noted that different portions of the historic site were re-visited in 1997, 1998, 2006, and 2010, with the 1998 visitation resulting in a large-scale evaluation effort for the entirety of the site (**Appendix E**). As a result of this evaluation, CA-SBR-8969H was not recommended eligible for listing in the National Register of Historic Places (NRHP) under any criteria. During the 2006 site visit, it was noted that much of the site had been destroyed by development and it was recommended that the site was not eligible for listing in the NRHP or the California Register of Historical Resources (CRHR). The site visit in 2010 noted additional destruction to the historic site and overall lack of integrity. None of the previous cultural resource studies conducted found resource CA-SBR-8969H eligible for listing in the NRHP or the CRHR.

The intensive-level pedestrian survey conducted of the project site for this EIR found the entire site highly disturbed due to prior grading and development with various instances of modern dumping and squatting observed. The field survey also confirmed the presence of resource CA-SBR-8696H at the project site and noted the collapsing entry structure to the bunker and historic debris. As such, Kimley-Horn cultural staff concurred with the prior recommendations that CA-SBR-8696H is not eligible for listing in the NRHP or CRHR and further noted that the site does not meet the definition of a “Historical Resource” or “Unique Archaeological Resource” under CEQA. No new or other resources were identified at the project site as a result of the survey.

In addition to the walkover survey, research within the National Register, California Register, National Historic Landmarks list, and other cultural databases revealed no other cultural resources. Historical aerial imagery was also reviewed for the presence of a potential resource. The imagery revealed development associated with the Rialto Military Munitions Bunker Complex and grading activities occurring in the northern and southern portions of the project site from the 1980s through the 2000s. No other potential cultural resources were revealed.

Although the project site was noted as highly disturbed due to prior grading and development, and no known NRHP or CRHR eligible historical resources were identified, there is the potential for Project implementation to unearth and impact unknown, subsurface cultural resources. Therefore, Mitigation Measure (MM) CUL-1 requires the retention of an archaeologist, MM CUL-2 requires the preparation of a Cultural Resource Management Plan for the project, MM CUL-3 requires cultural sensitivity training, MM CUL-4 requires archaeological monitoring, and MM CUL-5 outlines appropriate protocol and treatment in the event a cultural resource is discovered. MM CUL-1 through MM CUL-5 would ensure that if an unknown cultural resource is unearthed during Project construction it would not result in a substantial adverse change in the significance of the resource. Therefore, potential impacts to historical resources pursuant to Section 15064.5 would be reduced to a less than significant level.

Impact 4.4-2:	**Would the Project cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5?** ***Level of Significance:*** Less than Significant with the incorporation of MM CUL-1 through MM CUL-5.

As noted above, one cultural resource, the World War II-era complex CA-SBR-8696H, was identified as partially located within the southwestern portion of the project site. In concurrence with prior recommendations, CA-SBR-8696H was found not eligible for listing in the NRHP or CRHR, and the site does not meet the definition of a "Historical Resource" or "Unique Archaeological Resource" under CEQA.

The intensive-level pedestrian survey conducted for the project site found the entire site highly disturbed due to prior grading and development. The field survey confirmed the presence of CA-SBR-8696H at the project site and noted the collapsing entry structure to the bunker and historic debris. No new or other cultural resources (including other architectural historical resources, prehistoric archaeological resources, or historic archaeological resources) were identified on the project site as a result of the survey. Further, the extent of prior disturbance indicates there is low potential for intact buried cultural resources at the project site.

Although low, there is the potential for Project implementation to unearth and impact an unknown, subsurface archaeological resource that could be determined a "Unique Archaeological Resource." Despite the low likelihood of discovery, if a "Unique Archaeological Resource" is discovered during the Project's ground-disturbing activities, a substantial adverse change in the significance of such a resource could occur. As outlined above the Project would comply with MM CUL-1 through MM CUL-5, which would ensure the discovery of unrecorded cultural resources during construction activities would not result in potential impacts to archaeological resources pursuant to Section 15064.5 and impacts would be less than significant.

Impact 4.4-3:	**Would the Project disturb any human remains, including those interred outside of formal cemeteries?** ***Level of Significance:*** Less than Significant Impact

There are no dedicated cemeteries on or near the project site. The disturbance of most Native American human remains is typically in association with prehistoric archaeological sites. As discussed previously, the project site is not near an identified archaeological resource and the pedestrian survey conducted did

not identify any human remains (**Appendix E**). Additionally, as noted above the project site is highly disturbed. Given the absence of known archaeological resources and the extent of on-site disturbance, there is low potential for Project excavation and grading to encounter human remains. Despite the low likelihood of discovery, if previously unknown human remains are discovered during the Project's ground-disturbing activities, a substantial adverse change in the significance of such a resource could occur. Therefore, in the event human remains are encountered during excavation or disturbance activities, compliance with the California Health and Safety Code Section 7050.5 and Public Resources Code Section 5097.98, outlined below and identified in Standard Condition (SC) CUL-1 would preclude significant impacts to human remains.

Health and Safety Code Section 7050.5 and Public Resources Code Section 5097.98 require proper treatment in accordance with applicable laws and describe the general provisions for the treatment of human remains. Specifically, Health and Safety Code Section 7050.5 prescribes the requirements for the treatment of any human remains that are accidentally discovered during site excavation. Health and Safety Code Section 7050.5 also requires that all activities cease immediately and that a qualified archaeologist and Native American monitor be contacted immediately. As required by State law, the future development facilitated by the Project would implement the procedures set forth in Public Resources Code Section 5087.98, including evaluation by the County Coroner and notification of the NAHC in the unlikely event that Native American human remains are discovered during ground disturbing activities. The NAHC would designate the "Most Likely Descendent" of the unearthed human remains. If excavation results in the discovery of human remains, the future development would halt excavation near the find and any area that is reasonably suspected to overlay adjacent remains shall remain undisturbed until the County Coroner has investigated, and appropriate recommendations have been made for treatment and disposition of the remains. Therefore, following compliance with the established regulatory framework, specifically SC CUL-1, future development facilitated by the Project would have a less than significant impact concerning human remains. No mitigation is required.

4.4.7 Cumulative Impacts

For purposes of cumulative impact analysis to cultural resources, the geographic context for cumulative analysis of the Project is regional and considers both direct and indirect impacts over a wide area. This geographic scope of analysis is appropriate because the archaeological and historical resources within this area are expected to be similar to those that occur on the project site due to their similar environment, geology, and hydrology. This discussion is focused on the Project's potential for resulting in site-specific impacts that could contribute to a cumulative loss. However, cultural resources impacts are site-specific and not generally subject to cumulative impacts unless multiple projects impact a common resource, or a significant affected resource extends off the site, such as a historic townsite or district. With this consideration, the cumulative analyses for historical and archaeological resources considers whether the Project, in combination with the past, present, and reasonably foreseeable projects, could cumulatively affect any common cultural resources.

The Project could result in potential site-specific impacts to unknown cultural resources discovered during Project construction, especially ground-disturbing activities. However, implementation of MM CUL-1 through MM CUL-5 would reduce the Project's incremental potential impacts to historical and archaeological resources to less than significant and ensure site-specific impacts to cultural resources would not be cumulatively considerable. Other projects within the cumulative study area also have the

potential to result in damage and/or loss to unknown cultural resources. Similar to the proposed Project, past, present, and reasonably foreseeable projects in the City would be required to comply with all applicable State, federal, and local regulations concerning preservation, salvage, or handling of cultural resources. Therefore, the Project's contribution to cumulative impacts would be less than significant.

As discussed above, Project construction has the potential to disturb unknown human remains. Compliance with Health and Safety Code Section 7050.5 and Public Resources Code Section 5097.98, as outlined in SC CUL-1, would require proper treatment in accordance with applicable laws for human remains and reduce potential site-specific impacts to less than significant. Similar to the proposed Project, past, present, and reasonably foreseeable projects in the City would also be required to comply with Health and Safety Code Section 7050.5 and Public Resources Code Section 5097.98 which would reduce potential adverse impacts to human remains in the cumulative study area. Therefore, the Project's incremental effect is not cumulatively considerable when viewed in connection with the effects of other closely related past projects, the effects of other current projects, and the effects of probable future projects. Thus, cumulative impacts to cultural resources would be less than significant.

4.4.8 Mitigation Program

Standard Conditions

SC CUL-1: If human remains are encountered during the undertaking, California State Health and Safety Code Section 7050.5 states that excavation shall stop and no further disturbance shall occur within 100 feet of the discovery until the County Coroner has made a determination of origin and disposition of the remains pursuant to Public Resources Code Section 5097.98. The County Coroner must be notified of the find immediately. If the remains are determined to be prehistoric, the Coroner will notify the Native American Heritage Commission (NAHC), which will determine and notify a Most Likely Descendant (MLD). With the permission of the landowner or his/her authorized representative, the MLD may inspect the site of the discovery within 48 hours of notification. If the NAHC is unable to identify an MLD, the MLD fails to make a recommendation, or the landowner or his/her authorized representative rejects the recommendation, the human remains and associated items will be interred on the property with appropriate dignity in a location that will not be subject to future disturbance.

Mitigation Measures

MM CUL-1: **Retention of Archaeologist.** Prior to issuance of any permit for ground-disturbing activities, the Project Applicant shall provide evidence to the City of Rialto that a qualified professional archaeologist meeting Secretary of the Interior professional qualifications (Project Archaeologist) has been retained.

MM CUL-2: **Cultural Resources Management Plan.** Prior to any ground-disturbing activities the Project Archaeologist shall develop a Cultural Resource Management Plan (CRMP) to address the details, timing, and responsibilities of all archaeological and cultural resource activities that occur on the project site. The CRMP shall be written in consultation with the Consulting Tribes and shall include the following: approved Mitigation Measures (MM)/ Conditions of Approval (COA), contact information for all pertinent parties, parties'

responsibilities, procedures for each MM or COA, and an overview of the Project schedule.

MM CUL-3: **Cultural Resources Sensitivity Training.** A Cultural Resources Training shall be provided to all construction managers and construction personnel prior to commencing any ground disturbance work within the project area. The training shall be prepared and conducted or overseen by the Project Archaeologist. The training content shall include, but is not limited to, information about any known cultural resources in Project area and vicinity and the process for inadvertent discovery. The training may be discontinued when ground disturbance is completed. Construction personnel shall not be permitted to operate equipment within the construction area unless they have attended the training. The Qualified Archeologist or designated Archaeological Monitor and Monitoring Tribes' designated representatives shall attend the pre-grade meeting with the grading contractors to conduct the initial training and explain and coordinate the requirements of the Cultural Resource Management Plan.

MM CUL-4: **Archaeological Monitoring.** The Project Archaeologist shall monitor or supervise archaeological monitors (Monitors) for initial ground disturbing activities. After initial grading, should no cultural resources be present and/or subsurface soils indicate a low likelihood for significant intact resources, the Project Archaeologist shall have the ability to recommend archaeological monitoring be decreased or eliminated after initial ground-disturbing activities are complete, which shall be approved in writing by the City. Any such recommendation shall be specific to archaeological monitoring and not impact the implementation of Mitigation Measures TCR-1 and/or TCR-2.

MM CUL-5: **Inadvertent Discovery of Cultural Resources.** In the event that cultural resources are discovered during Project implementation, all earthwork and ground-disturbing activities shall halt within a buffer of the discovery established by the Project Archaeologist and the Project Archaeologist shall assess the nature and significance of the find. The Project Archaeologist shall coordinate with the City and identify whether the resource is potentially significant and if it requires further evaluation. Work on the other portions of the project site outside of the buffered area may continue during this assessment period. If the cultural resources are Native American in origin, the Consulting Tribes must be immediately contacted and consulted regarding potential significance and treatment of the resource. Specifically, the Consulting Tribes shall be contacted, as detailed within Tribal Cultural Resources (TCR) Mitigation Measure 3, regarding any pre-contact finds and shall be provided information after the Project Archaeologist makes his/her initial assessment of the nature of the find, so as to provide Tribal input with regard to significance and treatment. For any potential significant cultural resources, the Project Archaeologist shall make recommendations to the City to avoid or mitigate impacts to the resource. If significant pre-contact cultural resources, as defined by CEQA, are discovered and avoidance cannot be ensured, the archaeologist shall develop a Monitoring and Treatment Plan, the drafts of which shall be provided to the Consulting Tribes for review and comment, as detailed within TCR-1. The Project Archaeologist shall monitor the remainder of the project and implement the Plan accordingly. Preservation in place (i.e. avoidance) is the preferred manner of treatment. If preservation in place is not feasible,

treatment may include implementation of archaeological data recovery to excavate the resource along with subsequent laboratory processing and analysis.

Disposition of significant Native American archaeological materials, such as reburial or curation by a qualified repository within San Bernardino County, shall be agreed upon by the City and Consulting Tribes. Any significant non-Native American archaeological material shall be curated at a public, non-profit institution with a research interest in the materials within San Bernardino County, if such an institution agrees to accept the material. If no institution accepts the archaeological material, it shall be offered to a local school or historical society in the area for educational purposes. All identified cultural resources shall be recorded on appropriate California Department of Parks and Recreation (CA DPR 523) series forms and evaluated for significance. All findings shall be included within a Monitoring Report drafted by the Project Archaeologist and submitted to the City and Consulting Tribes for review. Final copies of the Monitoring Report shall be submitted to the City, Consulting Tribes, and South Central Coastal Information Center (SCCIC).

4.4.9 Level of Significance After Mitigation

Potential impacts to cultural resources would be reduced to a level considered less than significant after implementation of the specified mitigation set forth in this section.

4.5 ENERGY

4.5.1 Introduction

This EIR section examines the existing setting as it relates to energy conservation, identifies associated regulatory conditions and requirements, and presents the criteria used to evaluate potential impacts related to use of fuel and energy upon implementation of the Project. Energy calculations for the Project are included in **Appendix B: Air Quality, Energy, and Greenhouse Gas Modeling Data** of this EIR**.**

4.5.2 Regulatory Setting

Federal Regulations

National Energy Conservation Policy Act

The National Energy Conservation Policy Act serves as the underlying authority for federal energy management goals and requirements. Signed into law in 1978, it has been regularly updated and amended by subsequent laws and regulations. This Act is the foundation of most federal energy requirements.

Federal Energy Regulatory Commission

The Federal Energy Regulatory Commission (FERC) is an independent agency that regulates the interstate transmission of natural gas, oil, and electricity. FERC also regulates natural gas and hydropower projects. As part of that responsibility, FERC regulates the transmission and sale of natural gas for resale in interstate commerce, the transmission of oil by pipeline in interstate commerce, and the transmission and wholesale sales of electricity in interstate commerce. FERC also licenses and inspects private, municipal, and state hydroelectric projects; approves the siting and abandonment of interstate natural gas facilities, including pipeline, storage, and liquefied natural gas facilities; oversees environmental matters related to natural gas and hydroelectricity projects as well as major electricity policy initiatives; and administers accounting and financial reporting regulations and the conduct of regulated companies. Electricity is run by the states; however, FERC has jurisdiction over certain matters.

Energy Policy Act of 1992 and 2005

The Energy Policy Act of 1992 was passed to reduce the country's dependence on foreign petroleum and improve air quality. The act includes several parts intended to build an inventory of alternative fuel vehicles (AFVs) in large, centrally fueled fleets in metropolitan areas. The Act requires certain federal, state, and local government and private fleets to purchase a percentage of light-duty AFVs capable of running on alternative fuels each year. In addition, financial incentives are also included in the Act. Federal tax deductions are allowed for businesses and individuals to cover the incremental cost of AFVs. States are also required by the Energy Policy Act to consider a variety of incentive programs to help promote AFVs. The Energy Policy Act of 2005 provides renewed and expanded tax credits for electricity generated by qualified energy sources, such as landfill gas; provides bond financing, tax incentives, grants, and loan guarantees for clean renewable energy and rural community electrification; and establishes a federal purchase requirement for renewable energy.

Energy Independence and Security Act of 2007

The Energy Independence and Security Act (EISA; Public Law 110-140) was signed into law by former President George W. Bush on December 19, 2007. The Act's goal is to achieve energy security in the United States by increasing renewable fuel production, improving energy efficiency and performance, protecting consumers, improving vehicle fuel economy, and promoting research on greenhouse gas (GHG) capture

and storage. Under the EISA, the Renewable Fuel Standard program (RFS2) was expanded in several key ways:

- Expanded the RFS program to include diesel, in addition to gasoline;
- Increased the volume of renewable fuel required to be blended into transportation fuel from 9 billion gallons in 2008 to 36 billion gallons by 2022;
- Established new categories of renewable fuel and set separate volume requirements for each; and
- Required U.S. Environmental Protection Agency (U.S. EPA) to apply lifecycle GHG performance threshold standards to ensure that each category of renewable fuel emits fewer GHGs than the petroleum fuel it replaces.

RFS2 lays the foundation for achieving significant reductions of GHG emissions from the use of renewable fuels, for reducing imported petroleum, and encouraging the development and expansion of our nation's renewable fuels sector.

The EISA also includes a variety of new standards for lighting and for residential and commercial appliance equipment. The equipment includes residential refrigerators, freezers, refrigerator-freezers, metal halide lamps, and commercial walk-in coolers and freezers.

State Regulations

Assembly Bill 32 and Senate Bill 32

California's major initiative for reducing GHG emissions is outlined in Assembly Bill (AB) 32, the "California Global Warming Solutions Act of 2006." AB 32 codifies the Statewide goal of reducing GHG emissions to 1990 levels by 2020 (essentially a 15 percent reduction below 2005 emission levels; the same requirement as under S-3-05) and requires the California Air Resources Board (CARB) to prepare a Scoping Plan that outlines the main State strategies for reducing GHGs to meet the 2020 deadline. In addition, AB 32 requires CARB to adopt regulations to require reporting and verification of Statewide GHG emissions. Reductions in overall energy consumption have been implemented to reduce emissions.

In September 2016, then Governor Jerry Brown signed into legislation Senate Bill (SB) 32, which builds on AB 32 and requires the state to cut GHG emissions to 40 percent below 1990 levels by 2030. With SB 32, the Legislature also passed AB 197, which provides additional direction for updating the Scoping Plan to meet the 2030 GHG reduction target codified in SB 32. Adopted December 15, 2022, CARB's *2022 Scoping Plan for Achieving Carbon Neutrality* (2022 Scoping Plan) sets a path to achieve targets for carbon neutrality and reduce anthropogenic GHG emissions by 85 percent below 1990 levels by 2045 in accordance with AB 1279. Additional energy efficiency measures beyond the current regulations are needed to meet these goals as well as the AB 32 GHG reduction goal of reducing statewide GHG emissions to 1990 levels by 2020, the SB 32 goal of 40 percent below 1990 levels by 2030, and the AB 1279 goal of 85 percent below 1990 levels by 2045; see **Section 4.7: Greenhouse Gas Emissions** for a discussion of AB 32, SB 32, and AB 1279). To achieve the targets of AB 1279, the 2022 Scoping Plan relies on existing and emerging fossil fuel alternatives and clean technologies, as well as carbon capture and storage. Specifically, the 2022 Scoping Plan focuses on zero-emission transportation; phasing out use of fossil gas use for heating homes and buildings; reducing chemical and refrigerants with high GWP; providing communities with sustainable options for walking, biking, and public transit; displacement of fossil-fuel

fired electrical generation through use of renewable energy alternatives (e.g., solar arrays and wind turbines); and scaling up new options such as green hydrogen.

Advanced Clean Cars II

The Advanced Clean Cars II regulations will rapidly scale down light-duty-passenger, pickup truck and sports utility vehicle emissions starting with the 2026 model year through 2035. The regulations will first amend the Zero-emission Vehicle Regulation to require an increasing number of zero-emission vehicles and rely on currently available advanced vehicle technologies (i.e., battery-electric, hydrogen fuel cell electric and plug-in hybrid) to meet air quality and climate change emissions standards. Second, the Low-emission Vehicle Regulations were amended to include increasingly stringent standards for gasoline cars and heavier passenger trucks to continue to reduce smog-forming emissions. The regulations will substantially reduce air pollutants that cause climate change and threaten public health. In addition, the regulations will provide public health benefits of at least 12 billion dollars over the life of reductions by reducing premature deaths, hospitalizations and lost workdays associated with exposure to air pollution.

Advanced Clean Trucks

The Advanced Clean Trucks regulations is a manufacturer zero-emissions vehicle (ZEV) sales requirement and a one-time reporting requirement for fleets and large entities. The development and use of advanced clean trucks will help CARB achieve its emissions reduction strategies as outlined in the State Implementation Plan (SIP), Sustainable Freight Action Plan, SB 350, and AB 32.

On January 13, 2025, CARB withdrew its requests for CAA waivers from the U.S. EPA needed to support four adopted vehicle emissions regulations: (1) the Advanced Clean Fleets Regulations; 2) the In-Use Locomotive Regulations; 3) part of the Commercial Harbor Craft and Ocean-Going Vessels At-Berth Regulations; and 4) part of the Transport Refrigeration Unit Engine Standards Regulations. Implementation of these regulations is currently unknown.

Renewable Portfolio Standards[1]

In 2002, California established its Renewable Portfolio Standard program with the goal of increasing the annual percentage of renewable energy in the State's electricity mix by the equivalent of at least one percent of sales, with an aggregate total of 20 percent by 2017. The California Public Utilities Commission subsequently accelerated that goal to 2010 for retail sellers of electricity (Public Utilities Code §399.15(b)(1)). Then-Governor Schwarzenegger signed Executive Order S-14-08 in 2008, increasing the target to 33 percent renewable energy by 2020. In September 2009, Governor Schwarzenegger continued California's commitment to the Renewable Portfolio Standard by signing Executive Order S-21-09, which directs the California Air Resources Board (CARB) under its AB 32 authority to enact regulations to help the State meet its Renewable Portfolio Standard goal of 33 percent renewable energy by 2020. In September 2010, CARB adopted its Renewable Electricity Standard regulations, which require all of the State's load-serving entities to meet this target. In October 2015, then-Governor Brown signed into legislation SB 350, which requires retail sellers and publicly owned utilities to procure 50 percent of their electricity from eligible renewable energy resources by 2030. Signed in 2018, SB 100 revised the goal of the program to achieve the 50 percent renewable resources target by December 31, 2026, and to achieve a 60 percent target by December 31, 2030.

[1] California Public Utilities Commission. 2021. *Renewable Portfolio Standard (RPS) Program.* Retrieved from: https://www.cpuc.ca.gov/rps/. Accessed August 9, 2024.

SB 100 established a further goal to have an electric grid that is entirely powered by clean energy by 2045. Under SB 100, the State cannot increase carbon emissions elsewhere in the western grid or allow resource shuffling to achieve the 100 percent carbon-free electricity target. Approved in 2022, SB 1020 revised the State policy to provide that eligible renewable energy resources and zero-carbon resources supply 90 percent of all retail sales of electricity to California end-use customers by December 31, 2035; 95 percent of all retail sales of electricity to California end-use customers by December 31, 2040; 100 percent of all retail sales of electricity to California end-use customers by December 31, 2045; and, 100 percent of electricity procured to serve all State agencies by December 31, 2035.

California ISO

The California Independent System Operator (Cal ISO) is a non-profit Independent System Operator serving California. The California ISO manages the flow of electricity across high-voltage, long-distance power lines, operates a competitive wholesale energy market, and oversees transmission planning by and to its member utilities.

State of California Energy Plan

The California Energy Commission (CEC) is responsible for preparing the State Energy Plan, which identifies emerging trends related to energy supply, demand, conservation, public health and safety, and the maintenance of a healthy economy. The Plan calls for the state to assist in the transformation of the transportation system to improve air quality, reduce congestion, and increase the efficient use of fuel supplies with the least environmental and energy costs. To further this policy, the plan identifies several strategies, including assistance to public agencies and fleet operators and encouragement of urban designs that reduce vehicle miles traveled (VMT) and accommodate pedestrian and bicycle access.

California Building Energy Efficiency Standards: Title 24, Part 6 (California Energy Code)

The Code California Energy Code (Title 24, Part 6) was created as part of the California Building Standards Code (Title 24 of the California Code of Regulations) by the California Building Standards Commission in 1978 to establish statewide building energy efficiency standards to reduce California's energy use. In general, Title 24 energy code is designed to reduce wasteful and unnecessary energy consumption in newly constructed and existing buildings. The CEC updates the Title 24 Energy Efficiency Standards every three years to allow consideration and possible incorporation of new energy efficiency technologies and methods. The Title 24 Energy Efficiency Standards conserve nonrenewable resources, such as natural gas, and ensure renewable resources are extended as far as possible to reduce the need for constructing new power plants.

On August 11, 2021, the CEC adopted the 2022 Energy Code. In December 2022, it was approved by the California Building Standards Commission for inclusion into the California Building Standards Code. The 2022 Energy Code encourages efficient electric heat pumps, establishes electric-ready requirements for new homes, expands solar photovoltaic (PV) and battery storage standards, strengthens ventilation standards, and more. Buildings whose permit applications are applied for on or after January 1, 2023, must comply with the 2022 Energy Code.

The Title 24 Energy Efficiency Standards include provisions applicable to all buildings, residential and non-residential, which describe requirements for documentation and certificates that the building meets the standards. These provisions include mandatory requirements for efficiency and design of the following types of systems, equipment, and appliances: air conditioning systems; heat pumps; water chillers; gas- and oil-fired boilers; cooling equipment; water heaters and equipment; pool and spa heaters and

equipment; gas-fired equipment including furnaces and stoves/ovens; windows and exterior doors; joints and other building structure openings (envelope); insulation and cool roofs; lighting control devices; and solar PV systems.

The standards include additional mandatory requirements for space conditioning (cooling and heating), water heating, indoor and outdoor lighting systems, as well as equipment in non-residential, high-rise residential, and hotel or motel buildings. Mandatory requirements for low-rise residential buildings cover indoor and outdoor lighting, fireplaces, space cooling and heating equipment (including ducts and fans), and insulation of the structure, foundation, and water piping. The standards require solar PV systems for new homes. In addition to the mandatory requirements, the standards call for further energy efficiency that can be provided through a choice between performance and prescriptive compliance approaches. Separate sections apply to low-rise residential and to non-residential, high-rise residential, and hotel or motel buildings. In buildings designed for mixed use (e.g., commercial and residential), each section must meet the standards applicable to that type of occupancy.

The performance approach set forth under these standards provides for the calculation of an energy budget for each building and allows flexibility in building systems and features to meet the budget. The energy budget addresses space-conditioning (cooling and heating), lighting, and water heating. Compliance with the budget is determined using a CEC-approved computer software energy model. The alternative prescriptive standards require demonstrating compliance with specific minimum efficiency for components of the building such as building envelope insulation R-values, fenestration (areas, U-factor and solar heat gain coefficients of windows and doors) and heating and cooling, water heating and lighting system design requirements. These requirements vary depending on the building's location in the State's 16 climate zones.

California Green Building Standards

The California Green Building Standards Code (California Code of Regulations, Title 24, Part 11), commonly referred to as the CALGreen Code, is a statewide mandatory construction code that was developed and adopted by the California Building Standards Commission and the California Department of Housing and Community Development. CALGreen standards require new residential and commercial buildings to comply with mandatory measures under five topical areas: planning and design; energy efficiency; water efficiency and conservation; material conservation and resource efficiency; and environmental quality. CALGreen also provides voluntary tiers and measures that local governments may adopt which encourage or require additional measures in the five green building topics. The CEC approved the 2022 California Green Building Standards Code on September 30, 2022, and the code went into effect on January 1, 2023.

2008 California Energy Action Plan

The 2008 Energy Action Plan Update provides a status update to the 2005 Energy Action Plan II, which is the State of California's principal energy planning and policy document (CPUC and CEC, 2008). The plan continues the goals of the original Energy Action Plan, describes a coordinated implementation plan for State energy policies, and identifies specific action areas to ensure that California's energy is adequate, affordable, technologically advanced, and environmentally sound. First-priority actions to address California's increasing energy demands are energy efficiency, demand response (i.e., reduction of customer energy usage during peak periods in order to address system reliability and support the best use of energy infrastructure), and the use of renewable sources of power. If these actions are unable to satisfy the increasing energy and capacity needs, the plan supports clean and efficient fossil-fired generation.

CEQA Guidelines Appendix F

CEQA Section 21100(b)(3) and CEQA Guidelines Section 15126.4 require EIRs to describe, where relevant, the wasteful, inefficient, and unnecessary use of energy caused by a project. In 1975, largely in response to the oil crisis of the 1970s, the California State Legislature adopted AB 1575, which created the CEC. The CEC's statutory mission is to forecast future energy needs, license thermal power plants of 50 megawatts or larger, develop energy technologies and renewable energy resources, plan for and direct State responses to energy emergencies, and promote energy efficiency through the adoption and enforcement of appliance and building energy efficiency standards. AB 1575 also amended CEQA Section 21100(b)(3) to require EIRs to consider the wasteful, inefficient, and unnecessary use of energy caused by a project. In addition, CEQA Guidelines Section 15126.4 was adopted in 1998 which requires that an EIR describe feasible mitigation measures which would minimize the inefficient and unnecessary use of energy. Thereafter, the State Resources Agency created CEQA Guidelines Appendix F – Energy Conservation.

Pursuant to Appendix F, an EIR must include a "discussion of the potential energy impacts of proposed projects…"[2] However, because lead agencies have not consistently included such analysis in their EIRs, California's Natural Resources Agency amended Appendix F to the CEQA Guidelines in 2009 "to ensure that lead agencies comply with the substantive directive in § 21100(b)(3)." CEQA Guidelines Appendix F lists environmental impacts and mitigation measures that an EIR may include. What is required is a "discussion of the potential energy impacts of proposed projects, with particular emphasis on avoiding or reducing inefficient, wasteful and unnecessary consumption of energy." Potential impacts that may be discussed include:

- A project's energy requirements and its energy use efficiencies by amount and fuel type for each stage of a project including construction, operation, maintenance, or removal. If appropriate, the energy intensiveness of materials may be discussed.
- The effects of a project on local and regional energy supplies and on requirements for additional capacity.
- The effects of a project on peak and base period demands for electricity and other forms of energy.
- The degree to which a project complies with existing energy standards.
- The effects of a project on energy resources.
- A project's projected transportation energy use requirements and its overall use of efficient transportation alternatives.

CEQA Guidelines, Appendix F assists EIR preparers in determining whether a project will result in the inefficient, wasteful, and unnecessary use of energy.

Executive Order B-30-15, Senate Bill 350, and Senate Bill 100

In April 2015, then Governor Jerry Brown issued Executive Order B-30-15, which established a GHG reduction target of 40 percent below 1990 levels by 2030. SB 350 (Chapter 547, Statutes of 2015) advanced these goals through two measures. First, the law increases the renewable power goal from 33 percent renewables by 2020 to 50 percent by 2030. Second, the law requires the CEC to establish annual targets to double energy efficiency in buildings by 2030. The law also requires the California Public Utilities

[2] California Association of Environmental Professionals (AEP). 2025. *California Environmental Quality Act, Appendix F Energy Conservation.* Retrieved from: https://www.califaep.org/docs/CEQA_Handbook_2025combined.pdf.

Commission (CPUC) to direct electric utilities to establish annual efficiency targets and implement demand-reduction measures to achieve this goal. In 2018, SB 100 revised the goal of the program to achieve the 50 percent renewable resources target by December 31, 2026, and to achieve a 60 percent target by December 31, 2030. SB 100 also established a further goal to have an electric grid that is entirely powered by clean energy by 2045.

Executive Order B-55-18 to Achieve Carbon Neutrality

In September 2018, then Governor Jerry Brown issued Executive Order B-55-18, which established a new statewide goal to achieve carbon neutrality no later than 2045 and maintain net negative emissions thereafter. The law requires CARB to work with relevant state agencies to develop a framework that implements and tracks the progress toward said goal. CARB will also be required to work with relevant state agencies to ensure future Scoping Plans identify measures to achieve the carbon neutrality goal (State of California, 2018, p.2). Carbon neutrality, or having a net zero carbon footprint, refers to achieving net zero carbon dioxide emissions by balancing carbon emissions with carbon removal or simply eliminating carbon emissions altogether.

Regional and Local Regulations

Rialto General Plan

The General Plan Chapter 2 *Managing Our Land Supply Element* identifies goals and policies for conservation techniques to reduce energy use and minimize depletion of energy resources. The *Managing Our Land Supply Element* describes the conservation goals and policies that the City of Rialto has identified for implementation to provide a high quality of life for residents and the overall community. The following includes General Plan goals and policies that have been adopted by the City for the purpose of avoiding or mitigating an environmental effect and are applicable to the proposed Project.

Goal 2-31	**Incorporate green building and other sustainable building practices into development projects.**
Policy 2-31.1	Explore and adopt the use of green building standards and Leadership in Energy and Environmental Design (LEED) or similar in both private and public projects.
Policy 2-31.2	Promote sustainable building practices that go beyond the requirements of Title 24 of the California Administrative Code, and encourage energy-efficient design elements, as appropriate.
Policy 2-31.3	Support sustainable building practices that integrate building materials and methods that promote environmental quality, economic vitality, and social benefit through the design, construction, and operation of the built environment.
Goal 2-32	**Conserve energy resources.**
Policy 2-32.1	Require the incorporation of energy conservation features into the design of all new construction and site development activities.

Rialto Airport Specific Plan

The Rialto Airport Specific Plan was adopted by the City in November 1997. The Rialto Municipal Airport ceased operations in 2014 and the former airport property and many of the properties adjacent to the Rialto Municipal Airport that were suited to accommodate development were removed from the Rialto Airport Specific Plan and incorporated into the Renaissance Specific Plan, which was adopted by the City

in 2010. The Rialto Airport Specific Plan serves as the zoning ordinance for parcels that were not removed; these parcels are primarily northwest, west, and east of the former Rialto Municipal Airport. The Rialto Airport Specific Plan also provides a framework to guide future land use and development decisions in this area. The Rialto Airport Specific Plan does not contain specific policies related to energy.

City of Rialto Climate Adaptation Plan[3]

The City of Rialto Climate Adaptation Plan outlines goals to reduce energy consumption and GHG emissions to become a more sustainable community. Goals include:

- Prevent truck routes from disproportionately impacting disadvantaged communities;
- Create a clean air checklist for new development of sensitive land uses;
- Increase use of low-emission and electric vehicles where feasible;
- Adopt building and maintenance standards that reflect the regional best practices in reducing urban heat island effect.

4.5.3 Existing Conditions

Existing Electricity and Natural Gas Supplies

Electricity

Electricity as a utility is a man-made resource. The production of electricity requires the consumption or conversion of energy resources, including water, wind, oil, gas, coal, solar, geothermal, and nuclear resources, into energy. The delivery of electricity involves a number of system components including substations and transformers that lower transmission line power (voltage) to a level appropriate for on-site distribution and use. The electricity generated is distributed through a network of transmission and distribution lines commonly called a power grid. Conveyance of electricity through transmission lines is typically responsive to market demands.

Energy capacity, or electrical power, is generally measured in watts (W) while energy use is measured in watt-hours (Wh). For example, if a light bulb has a capacity rating of 100 W, the energy required to keep the bulb on for 1 hour would be 100 Wh. If ten 100 W bulbs were on for 1 hour, the energy required would be 1,000 Wh or 1 kilowatt-hour (kWh). On a utility scale, a generator's capacity is typically rated in megawatts (MW), which is one million watts, while energy use is measured in megawatt-hours (MWh) or gigawatt-hours (GWh), which is one billion watt-hours.

Electrical services are provided to the area by Southern California Edison (SCE). SCE provides electricity to approximately 15 million people, 180 incorporated cities, 15 counties, 5,000 large businesses, and 280,000 small businesses throughout its 50,000-square-mile service area.[4] SCE provides electrical services to the City of Rialto (City) through State-regulated public utility contracts. SCE produces and purchases their energy from a mix of conventional and renewable generating sources. **Table 4.5-1: Energy Resources Used to Generate Electricity for SCE** shows the SCE electric power mix in 2022 compared to the statewide

2022 power mix. In 2022, electricity use attributable to the County of San Bernardino was approximately 16,630 GWh from non-residential and residential sectors.[5]

Table 4.5-1: Energy Resources Used to Generate Electricity for SCE (2022)

Energy Resources	2022 SCE Power Mix	2022 CA Power Mix
Eligible Renewable:	33.2%:	35.8%:
Biomass and Biowaste	*0.1%*	*2.1%*
Geothermal	*5.7%*	*4.7%*
Eligible Hydroelectric	*0.5%*	*1.1%*
Solar	*17.0%*	*17.0%*
Wind	*9.8%*	*10.8%*
Coal	0.0%	2.1%
Large Hydroelectric	3.4%	9.2%
Natural Gas	24.7%	36.4%
Nuclear	8.3%	9.2%
Other	0.1%	0.1%
Unspecified Sources of Power[1]	30.3%	7.1%
Total	**100%**	**100%**

1 Unspecified power is electricity that has been purchased through open market transactions and is not traceable to a specific generation source.

Natural Gas

The Southern California Gas Company (SoCalGas), the service provider for the project area, services approximately 21 million people in a 20,000-square-mile service territory.[6] SoCalGas has four storage fields: Aliso Canyon, Honor Rancho, La Goleta, and Playa del Rey, as well as a combined storage capacity of approximately 134 billion cubic feet. According to the CEC, natural gas demand in the SoCalGas service area was approximately 5,027 million therms in 2022.[7]

SoCalGas projects that total demand for natural gas will decline at an annual rate of 0.7 percent from 2024 to 2040.[8] The decline in demand is driven by increased energy efficiency and updated fuel substitutions assumptions. Factors that contribute to the downward trend include Title 20 and Title 24 Code and Standards and renewable energy goals that impact gas-fired electricity.

Energy Consumption

Energy use is typically quantified using the British Thermal Unit (BTU). Total energy consumption in California was 6,882 trillion BTU in 2022[9] (the most recent year for which this specific data is available),

which equates to an average of approximately 176 million BTU per capita. Of California's total energy use, the breakdown by sector is approximately 43 percent transportation, 22 percent industrial, 18 percent residential, and 17 percent commercial. Electricity and natural gas in California are generally used by stationary sources such as residences, commercial sites, and industrial facilities, whereas petroleum use is generally accounted for by transportation-related energy use. In 2023, taxable gasoline sales (including aviation gasoline) in California accounted for 13,584,697,639 gallons of gasoline.[10] The County's electricity consumption from 2012 to 2022 is shown in **Table 4.5-2: Electricity Consumption in San Bernardino County 2012-2022**. As indicated in the table, the County's energy consumption has steadily increased between 2012 and 2022.

4.5.4 Methodology

This section analyzes energy use on three sources of energy that are relevant to the proposed Project, including electricity, natural gas, and transportation fuel for vehicle trips associated with new development, as well as the fuel necessary for Project construction. The analysis of the Project's electricity and natural gas use is based on the California Emissions Estimator Model (CalEEMod), which quantifies energy use for occupancy. The results of CalEEMod are included in **Appendix B** to this EIR. Modeling related to Project energy use was based primarily on the default settings in CalEEMod. The amount of

operational fuel use was estimated using CalEEMod outputs for the Project and CARB Emissions Factor (EMFAC) 2021 computer program for typical daily fuel use in San Bernardino County. Construction fuel was calculated based on CalEEMod emissions outputs and conversion ratios from the Climate Registry.

The Project is evaluated against the significance criteria/thresholds below, as the basis for determining the impact's level of significance concerning energy. This analysis considers the existing regulatory framework (i.e., laws, ordinances, regulations, and standards) that avoid or reduce the potentially significant environmental impact. Where significant impacts remain despite compliance with the regulatory framework, feasible mitigation measures are recommended, where warranted, to avoid or reduce the Project's potentially significant environmental impacts.

4.5.5 Thresholds of Significance

The following significance criteria for energy resources were derived from the Environmental Checklist in CEQA Guidelines Appendix G. The proposed Project would result in a significant impact to energy resources if it would:

- Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation.
- Conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

4.5.6 Project Impacts and Mitigation

Threshold 4.5-1:	**Would the Project result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?**
	Level of Significance: Less than Significant Impact

Construction

The energy associated with Project construction includes electricity use associated with water utilized for dust control, diesel fuel from on-road hauling trips, vendor trips, and off-road construction diesel equipment, as well as gasoline fuel from on-road worker commute trips. Because construction activities typically do not require natural gas, it is not included. The methodology for each category is discussed below. This analysis relies on the construction equipment list and operational characteristics from CalEEMod; refer to **Appendix B: Air Quality, Energy, and Greenhouse Gas Modeling Data**. Energy consumption associated with the Project is summarized in **Table 4.5-5: Energy Use During Construction**.

Table 4.5-5: Energy Use During Construction

Project Source	Total Construction Energy[4]	San Bernardino County Annual Energy Consumption	Percentage of Countywide Construction
Electricity Use: GWh			
Water Use[1]	0.0080	16,630	0.00005%
Diesel Use: Gallons			
On-Road Construction Trips[2]	37,397	281,399,849	0.013%
Off-Road Construction Equipment[3]	60,373		0.021%
Construction Diesel Total	97,770		0.035%
Gasoline: Gallons			
On-Road Construction Trips	35,998	828,612,797	0.004%

1. Construction water use based on acres disturbed per day per construction sequencing and estimated water use per acre.
2. On-Road mobile source fuel use based on vehicle miles traveled (VMT) from CalEEMod and fleet-average fuel consumption in gallons per mile from EMFAC2021 in San Bernardino County for construction year 2025.
3. Construction fuel use was calculated based on CalEEMod emissions outputs and conversion ratios from the Climate Registry.
4. Total Construction Energy is the combined energy usage over approximately 15 months of construction.

Source: Refer to **Appendix B** for data assumptions used in this analysis and energy calculations.

Electricity

Water for Construction Dust Control. Electricity use associated with water use for construction dust control is calculated based on total water use and the energy intensity for supply, distribution, and treatment of water. The total number of gallons of water used is calculated based on acreage disturbed during grading and site preparation, as well as the daily watering rate per acre disturbed.

- The total acres disturbed are calculated using the methodology described in Chapter 4.2 of Appendix A of the CalEEMod User's Guide, available at: http://www.caleemod.com/.
- The water application rate of 3,020 gallons per acre per day is from the Air and Waste Management Association's Air Pollution Engineering Manual (1992).

The energy intensity value is based on the CalEEMod default energy intensity per gallon of water for San Bernardino County. As summarized in **Table 4.5-5**, the total electricity demand associated with water use for construction dust control would be approximately 0.0080 GWh over the duration of construction.

Petroleum Fuel

On-Road Diesel Construction Trips. The diesel fuel associated with on-road construction mobile trips is calculated based on vehicle miles traveled (VMT) from vehicle trips (i.e., worker, vendor, and hauling), the CalEEMod default diesel fleet percentage, and vehicle fuel efficiency in miles per gallon (mpg). VMT for the entire construction period is calculated based on the number of trips multiplied by the trip lengths for each phase shown in CalEEMod. Construction fuel was calculated based on CalEEMod emissions outputs and conversion ratios from the Climate Registry. In summary, the total diesel fuel associated with on-road construction trips would be approximately 37,397 gallons over the duration of buildout of the Project (see **Table 4.5-5**).

Off-Road Diesel Construction Equipment. Similarly, the construction diesel fuel associated with the off-road construction equipment is calculated based on CalEEMod emissions outputs and conversion ratios from the Climate Registry. The total diesel fuel associated with off-road construction equipment is approximately 60,373 gallons for the duration of buildout of the Project (see **Table 4.5-5**).

On-Road Gasoline Construction Trips. The gasoline fuel associated with on-road construction mobile trips is calculated based on VMT from vehicle trips (i.e., worker, vendor, and hauling), the CalEEMod default gasoline fleet percentage, and vehicle fuel efficiency in mpg using the same methodology as the construction on-road trip diesel fuel calculation discussed above. The total gasoline fuel associated with on-road construction trips would be approximately 35,998 gallons over the duration of buildout of the Project (see **Table 4.5-5**).

Construction Energy Use Analysis

The Project would have construction activities that would use energy, primarily in the form of diesel fuel (e.g., mobile construction equipment) and electricity (e.g., power tools). In total, construction of the Project would use approximately 0.0080 GWh of electricity, 35,998 gallons of gasoline, and 97,770 gallons of diesel. In 2022, San Bernardino County used 16,630 GWh of electricity. Project construction electricity use would represent less than 0.0001 percent of the current electricity use in San Bernardino County.

In 2025 (the year Project construction is anticipated to commence), San Bernardino County is anticipated to use approximately 828,612,797 gallons of gasoline and approximately 281,399,849 gallons of diesel fuel. During construction, gasoline fuel consumption would constitute 0.004 percent of average annual gasoline usage in the County and diesel fuel consumption would constitute 0.035 percent of average annual diesel used in the County. Based on the Project's relatively low construction fuel use proportional to annual County use, the Project would not substantially affect existing energy fuel supplies or resources. New capacity or additional sources of construction fuel are not anticipated to be required.

Transportation fuels (gasoline and diesel) are produced from crude oil, which can be domestic or imported from various regions around the world. Based on current proven reserves, current crude oil production would be sufficient to meet 50 years of worldwide consumption.[11] As such, it is expected that existing and planned transportation fuel supplies would be sufficient to serve the Project's construction demand.

SCE's total energy sales are projected to be 103,561 GWh of electricity in 2025.[12] Therefore, the Project's construction-related annual electricity consumption of 0.0080 GWh would represent less than 0.0001 percent of SCE's projected annual sales. Thus, it is anticipated that SCE's existing and planned electricity capacity and electricity supplies would be sufficient to serve the Project's temporary construction electricity demand.

Some energy conservation would occur during construction through compliance with State requirements that equipment not in use for more than five minutes be turned off. Project construction equipment would also be required to comply with the latest U.S. EPA and CARB engine emissions standards. These engines use highly efficient combustion engines to minimize unnecessary fuel use.

Contractors would be required to monitor air quality emissions of construction activities using applicable regulatory guidance such as from South Coast Air Quality Management District (SCAQMD) CEQA Guidelines. Additionally, construction is subject to and would comply with California regulations (e.g., California Code of Regulations, Title 13, Sections 2485 and 2449), which reduce diesel particulate matter and criteria pollutant emissions from in-use off-road diesel-fueled vehicles and limit the idling of heavy-duty construction equipment to no more than five minutes. This requirement indirectly relates to construction energy conservation because when air pollutant emissions are reduced from the monitoring and the efficient use of equipment and materials, energy use is reduced. There are no aspects of the

[11] BP Global, *Statistical Review of World Energy*, 2021.

[12] California Energy Commission, *CED 2023 Baseline Forecast – SCE High Demand Case*, January 2024.

Project that would foreseeably result in the inefficient, wasteful, or unnecessary use of energy during construction activities.

Due to increasing transportation costs and fuel prices, contractors and owners have a strong financial incentive to avoid wasteful, inefficient, and unnecessary use of energy during construction. There is growing recognition among developers and retailers that sustainable construction is not prohibitively expensive and that there is a significant cost-savings potential in green building practices. Substantial reduction in energy inputs for construction materials can be achieved by selecting building materials composed of recycled materials that require substantially less energy to produce than non-recycled materials. The project-related incremental increase in the use of energy bound in construction materials such as asphalt, steel, concrete, pipes, and manufactured or processed materials (e.g., lumber and gas) would not substantially increase demand for energy compared to overall local and regional demand for construction materials. It is reasonable to assume that production of building materials such as concrete, steel, etc., would employ all reasonable energy conservation practices in the interest in minimizing the costs of business.

As addressed, the Project's fuel from the entire construction period would increase fuel use in the County by less than one percent. It should be noted that the CEQA Guidelines Appendix G and Appendix F criteria require a project's effects on local and regional energy supplies and on the requirements for additional capacity to be addressed. A less than one percent increase in construction fuel demand is not anticipated to trigger the need for additional capacity. Additionally, use of construction fuel would be temporary and would cease once the Project is fully developed. As such, Project construction would have a nominal effect on the local and regional energy supplies.

There are no unusual characteristics that necessitate the use of construction equipment that would be less energy-efficient than at comparable construction sites in the region or State. Therefore, it is expected that construction fuel use associated with the Project would not be any more inefficient, wasteful, or unnecessary than other similar development projects of this nature. Therefore, potential energy resource impacts are considered less than significant, and no mitigation is required.

Operations

The energy consumption associated with Project operations would occur from building energy (electricity and natural gas) use, water use, and transportation-related fuel use. The Project is anticipated to be operational in 2026. The Project's annual energy use during operations is shown in **Table 4.5-6: Annual Energy Use During Operations.** The methodology for each category is discussed below.

Petroleum Fuel

The gasoline and diesel fuel associated with on-road vehicular trips is calculated based on total VMT calculated for the analyses in **Section 4.2: Air Quality**, **Section 4.7: Greenhouse Gas Emissions**, and average fuel efficiency is calculated from the EMFAC model. The EMFAC fuel efficiency data incorporates the Pavley Clean Car Standards and the Advanced Clean Cars Program.[13] As summarized in **Table 4.5-6**, the Project's total unmitigated gasoline and diesel fuel would be approximately 187,870 gallons per year and 728,982 gallons per year, respectively (each less than 1% of Countywide consumption). The Project's air quality analysis includes Mitigation Measure (MM) AQ-3 and MM AQ-4, which would also serve to

[13] The CARB EMFAC 2017 Technical Documentation from March 2018 notes that emissions are estimated with all current controls active, except Low Carbon Fuel Standards (LCFS). The reason for excluding LCFS is that most of the emissions benefits due to the LCFS come from the production cycle (upstream emissions) of the fuel rather than the combustion cycle (tailpipe). As a result, LCFS is assumed to not have a significant impact on CO_2 emissions from EMFAC's tailpipe emission estimates.

reduce fuel consumption. MM AQ-3 requires landscaping equipment to be 100 percent electric. MM AQ-4 requires the implementation of a Transportation Demand Management (TDM) program to reduce single-occupant vehicle trips and encourage public transit. It should be noted that energy consumption values shown in **Table 4.5-6** conservatively do not include all reductions from MM AQ-4 since the majority of the TDM program is not quantifiable in CalEEMod. However, TDM measures such as carpool/ vanpool/rideshare use were able to be quantified in CalEEMod; therefore, there was a reduction in operational gasoline consumption. With implementation of MM AQ-3 and MM AQ-4, the total mitigated gasoline consumption would be approximately 180,492 gallons per year.

Table 4.5-6: Annual Energy Use During Operations

Project Source	Project Annual Energy Consumption	San Bernardino County Annual Energy Consumption	Percentage of Countywide Consumption	Project Annual Energy Consumption	San Bernardino County Annual Energy Consumption	Percentage of Countywide Consumption
	Unmitigated			Mitigated		
Electricity Use						
Area[1,3]	0.946 GWh	16,630 GWh	0.0057%	0.0000 GWh	16,630 GWh	0.0000%
Water[1]	1.061 GWh		0.0064%	0.958 GWh		0.0058%
Total Electricity	2.007 GWh		0.0121%	0.958 GWh		0.0058%
Natural Gas Use						
Area[1,3]	126,662 therms	562,123,065 therms	0.0225%	0 therms	562,123,065 therms	0.0000%
Diesel Use						
Mobile[2]	728,982 gallons	281,589,289 gallons	0.2589%	728,982 gallons	281,589,289 gallons	0.2589%
Gasoline Use						
Mobile[2]	187,870 gallons	811,280,390 gallons	0.0232%	180,492 gallons	811,280,390 gallons	0.0222%

Notes:
1 The electricity, natural gas, and water usage are based on project-specific estimates and CalEEMod defaults.
2 Calculated based on the mobile source fuel use based on vehicle miles traveled (VMT) and fleet-average fuel consumption (in gallons per mile) from EMFAC2021 for operational year 2026.
3 Mitigated energy consumption includes implementation of Mitigation Measure (MM) AQ-2 that requires all-electric appliances instead of natural gas and no connections to natural gas utility lines, MM AQ-3 that requires all-electric landscape equipment, MM AQ-4 requires the implementation of a Transportation Demand Management (TDM) program to reduce single-occupant vehicle trips and encourage public transit, MM AQ-5 requires outdoor cargo handling equipment to be zero emissions or alternatively fueled, MM GHG-1 requires renewable energy to offset 100 percent of the expected building load energy consumption, MM GHG-2 requires buildings to meet or exceed CALGreen Tier 2 standards, and MM GHG-4 requires implementation of a Water Use Efficiency and Conservation Plan (refer to **Section 4.2: Air Quality** and **Section 4.7: Greenhouse Gas**).

Source: Refer to energy calculations in **Appendix B**.

Electricity

The electricity use during Project operations is based on CalEEMod defaults. The Project's total unmitigated electricity consumption would be approximately 2.007 GWh of electricity onsite per year (see **Table 4.5-6**). The electricity associated with operational water use is estimated based on the annual water use and the energy intensity factor is the CalEEMod default energy intensity per gallon of water for San Bernardino County. Project area water use is based on the CalEEMod default rates. The Project would use approximately 156.5 million gallons of water annually, which would require approximately 1.061 GWh per year for conveyance and treatment. **Section 4.7: Greenhouse Gas Emissions** includes MM GHG-1, MM GHG-2, and MM GHG-4 which would also reduce electricity consumption. MM GHG-1 requires renewable

energy to offset 100 percent of the expected building load energy consumption, MM GHG-2 requires buildings to meet or exceed CALGreen Tier 2 standards, and MM GHG-4 requires implementation of a Water Use Efficiency and Conservation Plan. With implementation of these mitigation measures, the total mitigated electricity consumption would be approximately 0.958 GWh per year.

Natural Gas

The methodology used to calculate the natural gas use associated with the Project is based on CalEEMod default rates. The Project's total unmitigated natural gas consumption would be approximately 126,662 therms per year (see **Table 4.5-6**). **Section 4.2: Air Quality** includes MM AQ-2, which requires the Project to use all-electric appliances and end uses instead of natural gas. MM AQ-2 also requires that the Project not include natural gas utility lines or connections. With implementation of this mitigation measure, the Project's total mitigated natural gas consumption would be approximately 0 therms on the site per year (see **Table 4.5-6**).

Operational Energy Use Analysis

Project operations would annually use approximately 0.958 GWh of electricity, 0 therms of natural gas, 180,492 gallons of gasoline, and 728,982 gallons of diesel with incorporation of MM AQ-2 through MM AQ-5, MM GHG-1, MM GHG-2, and MM GHG-4.

Californians used 287,826 GWh of electricity in 2022, of which San Bernardino County used 16,630 GWh. The Project's operational electricity use would represent less than 0.001 percent of electricity used in the State and 0.0058 percent of the energy use in San Bernardino County. The Project's mitigated electricity consumption estimated above includes reductions associated with MM AQ-2, MM AQ-3, MM AQ-4, MM AQ-5, MM GHG-1, MM GHG-2, and MM GHG-4. Regarding natural gas, Californians used 11,711 million therms of natural gas and 562 million therms of natural gas in San Bernardino County in 2022. The Project's unmitigated operational natural gas use would represent less than 0.001 percent of natural gas used in the State, and less than 0.1 percent of natural gas use in San Bernardino County. However, MM AQ-2 would require the Project to use all-electric appliances instead of natural gas and would prohibit connection to natural gas utility lines; therefore, the Project would not consume natural gas. Even without the application of mitigation, the Project's electricity and natural gas use would not be potentially significant due to wasteful, inefficient, or unnecessary consumption.

In 2026, Californians are anticipated to use approximately 13,429,720,378 gallons of gasoline and approximately 3,179,723,204 gallons of diesel fuel.[14] San Bernardino County annual gasoline fuel use in 2025 is anticipated to be 811,280,390 gallons and diesel fuel is anticipated to be 281,589,289 gallons. The expected Project operational use of gasoline and diesel would represent 0.000013 percent of current gasoline use and 0.000229 percent of current diesel use in the State. Project operational use of gasoline and diesel would represent 0.0222 percent of gasoline use and 0.2589 percent of diesel use in the County.

Based on the California Energy Demand 2023 Baseline Forecast (February 2022),[15] SCE's total energy sales in 2026 will be 96,356 GWh of electricity. As such, the project-related net annual electricity consumption of 0.958 GWh would represent approximately 0.00001 percent of SCE's projected sales in 2026. SCE would review the Project's estimated electricity consumption in order to ensure that the estimated power requirement would be part of the total load growth forecast for their service area and accounted for in

[14] California Air Resources Board, *EMFAC2021*.
[15] California Energy Commission, *CED 2023 Baseline Forecast – LSE and BA Tables High Demand Case*, January 2024.

the planned growth of the power system. Based on these factors, SCE's existing and planned electricity capacity and electricity supplies would be sufficient to serve the Project's electricity demand.

Based on the 2023 California Gas Report,[16] the California Energy and Electric Utilities estimates natural gas consumption within SoCalGas' planning area will be approximately 2,458 million cubic feet per day in 2022.[1] As previously mentioned, MM AQ-2 would require the Project to use all-electric appliances instead of natural gas and would prohibit connection to natural gas utility lines. Therefore, the Project would not impact SoCalGas' projected consumption and supplies for the area as the Project would not consume natural gas. According to the U.S. Energy Information Administration, the United States currently has over 80 years of natural gas reserves based on 2018 consumption.[17]

Transportation fuels (gasoline and diesel) are produced from crude oil, which can be domestic or imported from various regions around the world. Based on current proven reserves, current crude oil production would be sufficient to meet 50 years of worldwide consumption.[18] As such, it is expected that existing and planned transportation fuel supplies would be sufficient to serve the Project's demand.

None of the unmitigated Project energy uses exceed one percent of their corresponding County use. Project operations would not substantially affect existing energy or fuel supplies or resources. The Project would comply with applicable energy standards and new capacity would not be required. Therefore, unmitigated energy consumption impacts would be less than significant, and no mitigation is required.

It is noted that MM AQ-2, MM AQ-3, and MM AQ-5 in **Section 4.2: Air Quality** and MM GHG-1, MM GHG-2, and MM GHG-4 in **Section 4.7: Greenhouse Gas Emissions** were assumed in CalEEMod to reduce air quality and GHG emission impacts. Implementation of these mitigation measures would subsequently reduce operational energy consumption, although energy impacts would be less than significant without mitigation.

Energy Efficiency Measures

As discussed above, California's Energy Efficiency Standards for Residential and Non-Residential Buildings create uniform building codes to reduce California's energy use and provide energy efficiency standards for residential and non-residential buildings. These standards are incorporated within the California Building Code and are expected to substantially reduce the growth in electricity and natural gas use. For example, requirements for energy-efficient lighting, heating and cooling systems, and green building materials are expected to save additional electricity and natural gas. These savings are cumulative, doubling as years go by.

Regarding water energy conservation, the Project would incorporate drought-tolerant landscaping throughout portions of the site. Water-efficient irrigation controls would also be used in landscape areas. Comprehensive water conservation strategies would be developed to each respective land use as part of the Project plan development. Buildings would incorporate water-efficient fixtures and appliances to comply with Title 24. It should also be noted that SCE is subject to California's Renewable Portfolio Standard (RPS) Program. The RPS requires investor-owned utilities, electric service providers, and community choice aggregators to increase total procurement from eligible renewable energy resources to 33 percent by 2020 and 50 percent by 2030. SB 100 revised the goal of the program to achieve the 50 percent renewable resources target by December 31, 2026, and to achieve a 60 percent target by

[16] California Gas and Electric Utilities, *2024 California Gas Report*, 2024.

[17] U.S. Energy Information Administration, Frequently Asked Questions, *How Much Natural Gas Does the United States Have, and How Long Will It Last?* Retrieved from: https://www.eia.gov/tools/faqs/faq.php?id=58&t=8. Accessed August 9, 2024.

[18] BP Global, *Statistical Review of World Energy*, 2021.

December 31, 2030. SB 100 also established a further goal to have an electric grid that is entirely powered by clean energy by 2045. Renewable energy is generally defined as energy that comes from resources which are naturally replenished within a human timescale such as sunlight, wind, tides, waves, and geothermal heat.

As discussed above, California's Energy Efficiency Standards create uniform building codes to reduce California's energy use and provide energy efficiency standards for residential and non-residential buildings. These standards are incorporated within the California Building Code and are expected to substantially reduce the growth in electricity and natural gas use.

None of the Project energy uses would exceed one percent of the corresponding uses within the County. Project operations would not substantially affect existing energy or fuel supplies or resources. All Project buildings would comply with energy and fuel efficiency laws and regulations; therefore, the Project would not be wasteful or inefficient. Impacts would be less than significant, and no mitigation is required.

Threshold 4.5-2:	**Would the Project conflict with or obstruct a State or Local plan for renewable energy or energy efficiency.**
	Level of Significance: Less than Significant Impact

As discussed under Threshold 4.5-1, the energy conservation policies and plans relevant to the Project include the California Title 24 energy standards and the CALGreen Building Code. The Project would be required to comply with these existing energy standards. Compliance with State and local energy efficiency standards would ensure that the Project meets all applicable energy conservation policies and regulations. As such, the Project would not conflict with applicable plans for renewable energy or energy efficiency. SCAG's 2024-2050 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) or Connect SoCal, adopted in April 2024, integrates transportation, land use, and housing to meet GHG reduction targets set by CARB. The document establishes GHG emissions goals for automobiles and light-duty trucks, as well as an overall GHG target for the region consistent with both the target date of AB 32 and the post-2020 GHG reduction goals of SB 375. The Project would not conflict with the stated goals of the Connect SoCal; refer to **Section 4.7: Greenhouse Gas Emissions**. Energy consumption impacts would be less than significant, and no mitigation is required.

4.5.7 Cumulative Impacts

Construction and operations associated with implementation of the Project would result in the use of energy, but not in a wasteful manner, as discussed under Threshold 4.5-1. The use of energy would not be substantial in comparison to statewide electricity, natural gas, gasoline, and diesel demand; refer to **Table 4.5-5** and **Table 4.5-6**. As discussed above, the project-related construction electricity consumption would represent approximately 0.00005 percent of county-generated electricity. Therefore, the Project's construction electricity consumption would be negligible relative to SCE's generated electricity and electricity supplies would be sufficient to serve the Project's temporary construction electricity demand.

During operations, the project-related net annual electricity consumption would represent approximately 0.001 percent of SCE's projected sales in 2026. SCE would review the Project's estimated electricity consumption in order to ensure that the estimated power requirement would be part of the total load growth forecast for their service area and accounted for in the planned growth of the power system. The Project would not use natural gas and, therefore, would not impact SoCalGas's projected consumption and supplies for the service area. It should be noted that the planning projections of SCE and SoCalGas

consider planned development for their service areas and are in and of themselves providing for cumulative growth. Therefore, it is likely that the cumulative growth associated with the related projects is already accounted for in the planning of future supplies to cover projected demand.

Furthermore, transportation fuels (gasoline and diesel) are produced from crude oil, which can be domestic or imported from various regions around the world. Based on current proven reserves, current crude oil production would be sufficient to meet 50 years of worldwide consumption.[19] As such, it is expected that existing and planned transportation fuel supplies would be sufficient to serve the Project's construction and operational demand. New capacity or supplies of energy resources would not be required. Additionally, the Project would be subject to compliance with all federal, State, and local requirements for energy efficiency.

The Project and new development projects located within the cumulative study area would also be required to comply with all the same applicable federal, State, and local measures aimed at reducing fossil fuel consumption and the conservation of energy. The anticipated Project impacts, in conjunction with cumulative development in the vicinity, would increase urbanization and result in increased energy use. Potential land use impacts are site-specific and require evaluation on a case-by-case basis. As noted above, the Project would not result in significant impacts to State or local plans for renewable energy or energy efficiency. Therefore, the Project and identified cumulative projects are not anticipated to result in a significant cumulative impact. Therefore, potential impacts are considered less than significant.

4.5.8 Mitigation Program

Standard Conditions

No standard conditions are applicable.

Mitigation Measures

Although not required to reduce energy impacts to less than significant, MM AQ-2, MM AQ-3, MM AQ-4, and MM AQ-5 in **Section 4.2: Air Quality** and MM GHG-1, MM GHG-2, and MM GHG-4 in **Section 4.7: Greenhouse Gas Emissions** are applicable to the Project and would serve to further reduce energy consumption.

4.5.9 Level of Significance After Mitigation

Potential energy impacts would be less than significant.

4.6 GEOLOGY AND SOILS

4.6.1 Introduction

This section of the EIR describes the project site's existing setting as it relates to geology and soils; identifies applicable regulatory conditions and requirements; presents the criteria used to evaluate potential impacts on geology and soils; and identifies measures to reduce or avoid significant impacts. The analysis in this section is in part based on information from the Geotechnical Investigation and Infiltration Testing, prepared for the Project by Southern California Geotechnical, Inc. on June 26, 2023, and included as **Appendix F1: Geotechnical Investigation** and **Appendix F2: Infiltration Testing Report** to this EIR. In addition, paleontological records search results, prepared by the Western Science Center on May 13, 2024, were relied upon as well and are included as **Appendix F3: Paleontological Resources Memorandum** to this EIR.

4.6.2 Regulatory Setting

Federal Regulations

Earthquake Hazards Reduction Act

The Earthquake Hazards Reduction Act of 1977 (Public Law 95-124) established the National Earthquake Hazards Reduction Program (Program) which is coordinated through the Federal Emergency Management Agency, the United States Geological Survey (USGS), the National Science Foundation, and the National Institute of Standards and Technology. The purpose of the program is to establish measures for earthquake hazards reduction and promote the adoption of earthquake hazards reduction measures by federal, state, and local governments; national standards and model code organizations; architects and engineers; building owners; and others with a role in planning and constructing buildings, structures, and lifelines through (1) grants, contracts, cooperative agreements, and technical assistance; (2) development of standards, guidelines, and voluntary consensus codes for earthquake hazards reduction for buildings, structures, and lifelines; and (3) development and maintenance of a repository of information, including technical data, on seismic risk and hazards reduction. The program is intended to improve the understanding of earthquakes and their effects on communities, buildings, structures, and lifelines through interdisciplinary research that involves engineering, natural sciences, and social, economic, and decisions sciences.

Clean Water Act Section 402

Section 402 of the Clean Water Act authorizes the State Water Resources Control Board (SWRCB), a department of the California Environmental Protection Agency (CalEPA), to issue National Pollutant Discharge Elimination System (NPDES) General Construction Storm Water Permit (Water Quality Order 2022-0057-DWQ), referred to as the "General Construction Permit." Construction activities can comply with and be covered under the General Construction Permit provided they:

- Develop and implement a Storm Water Pollution Prevention Plan (SWPPP) which specifies Best Management Practices (BMPs) that will prevent all construction pollutants from contacting stormwater and with the intent of keeping all products of erosion from moving off-site into receiving waters;
- Eliminate or reduce non-stormwater discharges to storm sewer systems and other waters of the nation; and

- Perform inspections of all BMPs.

The SWPPP must contain a visual monitoring program; a chemical monitoring program for "non-visible" pollutants to be implemented if there is a failure of BMPs; and a sediment monitoring plan if the construction site discharges directly to a water body listed on the 303(d) list for sediment. The SWPPP would also include an Erosion Control Plan that would identify specific measures to control on-site and off-site erosion from the time ground disturbing activities are initiated through completion of grading. The Erosion Control Plan is included with a project's grading plan and would be subject to approval by the City Engineer.

Standard Procedures for the Assessment and Mitigation of Adverse Impacts to Paleontological Resources

The Standard Procedures for the Assessment and Mitigation of Adverse Impacts to Paleontological Resources outlines methods for assessing potential impacts to fossils and mitigating impacts from development. Impact mitigation includes pre-project survey and salvage, monitoring and screen washing during excavation to salvage fossils, conservation and inventory, and final reports and specimen curation.

Measures for adequate protection or salvage of significant paleontological resources are applied to areas determined to contain rock units that have either a high or undetermined potential for containing significant fossils. Specific mitigation measures generally need not be developed for areas of low paleontological potential. Developers (public and private) and contractors should be made aware, however, that if there is not an on-site monitor it will be necessary to contact a qualified professional paleontologist if fossils are unearthed in the course of excavation. This contingency should be planned for in advance. In order to save time and project delays, in the advance planning phases of a project, the developer should contact a qualified professional paleontologist and arrange for the salvage of any unanticipated fossils. The paleontologist will then salvage the fossils and assess the necessity for further mitigation measures, if applicable. Decisions regarding the intensity of the paleontological resource impact mitigation program will be made by the project paleontologist on the basis of the significance of the paleontological resources, and their biostratigraphic, biochronologic, paleoecologic, taphonomic, and taxonomic attributes, not on the ability of a project proponent to fund the paleontological resource impact mitigation program.

All phases of mitigation must be supervised by a qualified professional paleontologist who maintains the necessary paleontological collecting permits and repository agreements. All field teams are to be supervised by a paleontologist qualified to deal with the significant resources that might be encountered. The lead agency must assure compliance with the measures developed to mitigate impacts of excavation. To assure compliance at the start of a project, a statement that confirms a site's paleontological potential, confirms the repository agreement with an established public institution, and describes the program for impact mitigation, must be deposited with the lead agency and contractor(s) before any ground disturbance begins. In many cases, it will be necessary to conduct a salvage program prior to grading to prevent damage to known paleontological resources and to avoid delays to construction schedules. The impact mitigation program must include preparation, identification, cataloging, and curation of any salvaged specimens. All field notes, photographs, stratigraphic sections, and other data associated with the recovery of the specimens must be deposited with the institution receiving the specimens. Since it is not professionally acceptable to salvage specimens without preparation and curation of specimens and associated data, costs for this phase of the program must be included in the project budget. The mitigation

program must be reviewed and accepted by the lead agency. If a mitigation program is initiated early during the course of project planning, construction delays due to paleontological salvage activities can be minimized or even completely avoided.

State Regulations

Alquist-Priolo Earthquake Fault Zoning Act of 1972

The Alquist-Priolo Earthquake Fault Zoning Act, Public Resources Code (PRC) Sections 2621–2630, regulates development and construction of buildings intended for human occupancy to avoid the hazard of surface fault rupture. The Alquist-Priolo Earthquake Fault Zoning Act categorizes faults as active, potentially active, and inactive. Historic and Holocene age faults are considered active, Late Quaternary and Quaternary age faults are considered potentially active, and pre-Quaternary age faults are considered inactive. These classifications are qualified by the conditions that a fault must be shown to be "sufficiently active" and "well defined" by detailed site-specific geologic explorations to determine whether building setbacks should be established.

California Building Code

The 2022 California Building Code (CBC) is based on the 2021 International Building Code (IBC). The purpose of the CBC is to establish uniform standards for the construction and maintenance of buildings, electrical systems, plumbing systems, mechanical systems, and fire and life safety systems. The CBC is another name for the body of regulations known as the California Code of Regulations (CCR), Title 24, Part 2, which is a part of the California Building Standards Code and establishes minimum requirements for a building's structural strength and stability to safeguard the public health, safety, and general welfare and are updated every three years. Title 24 is assigned to the California Building Standards Commission, which, by law, is responsible for coordinating all building standards. Under State law, all building standards must be centralized in Title 24 or they are not enforceable.

California Health and Safety Code

Section 19100 et seq. of the California Health and Safety Code establishes the State's regulations for earthquake protection. This section of the code requires structural designs to be capable of resisting likely stresses produced by phenomena such as strong winds and earthquakes.

Seismic Hazards Mapping Act

The Seismic Hazards Mapping Act of 1990, PRC Sections 2690–2699, directs the California Department of Conservation, California Geological Survey (CGS) to delineate Seismic Hazard Zones. The purpose of the Seismic Hazards Mapping Act is to reduce the threat to public health and safety and to minimize the loss of life and property by identifying and mitigating seismic hazards. Cities, counties, and State agencies are directed to use seismic hazard zone maps developed by CGS in their land-use planning and permitting processes. The Seismic Hazards Mapping Act requires that site-specific geotechnical investigations be performed prior to permitting most urban development projects within seismic hazard zones.

California Penal Code Section 622.5

2020 California Penal Code Part 1 - Of Crimes and Punishments Title 14 – Malicious Mischief Section 622½ states "Every person, not the owner thereof, who willfully injures, disfigures, defaces, or destroys any object or thing of archeological or historical interest or value, whether situated on private lands or within any public park or place, is guilty of a misdemeanor."

Public Resources Code Section 5097.5

Requirements for paleontological resource management are included in PRC Division 5, Chapter 1.7, Section 5097.5, and Division 20, Chapter 3, Section 30244, which state:

> *No person shall knowingly and willfully excavate upon, or remove, destroy, injure or deface any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized footprints, inscriptions made by human agency, or any other archaeological, paleontological or historical feature, situated on public lands, except with the express permission of the public agency having jurisdiction over such lands. Violation of this section is a misdemeanor.*

These statutes prohibit the removal, without permission, of any paleontological site or feature from lands under the jurisdiction of the State or any city, county, district, authority, or public corporation, or any agency thereof. Consequently, local agencies are required to comply with PRC Section 5097.5 for their own activities, including construction and maintenance, as well as for permit actions (e.g., encroachment permits) undertaken by others. PRC Section 5097.5 also establishes the removal of paleontological resources as a misdemeanor and requires reasonable mitigation of adverse impacts to paleontological resources from developments on public (State, county, city, and district) lands.

California Public Resource Code Section 5097.5

California Public Resources Code Division 5 – Parks and Monuments Chapter 1.7 – Archaeological, Paleontological, and Historical Sites Section 5097.5 states:

> *A person shall not knowingly and willfully excavate upon, or remove, destroy, injure, or deface, any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized footprints, inscriptions made by human agency, rock art, or any other archaeological, paleontological or historical feature, situated on public lands, except with the express permission of the public agency having jurisdiction over the lands.*

Regional and Local Regulations

Rialto General Plan

The General Plan Chapter 5 *Safety and Noise Element* notes that Rialto emphasizes a proactive approach to planning which involves mitigating hazards present in the environment that may adversely affect property and threaten lives. Rialto recognizes the importance of providing a safe living environment for its residents. The City identifies policies to help minimize the effects of hazards. The following list includes General Plan goals and policies that have been adopted by the City for the purpose of avoiding or mitigating an environmental effect and are applicable to the proposed Project.

Goal 5-5 **Minimize impacts to public health, safety, and welfare as a result of seismic and geologic hazards.**

Policy 5–5.1 Require geotechnical investigations by certified engineering geologist or other qualified professionals for all grading and construction projects subject to geologic hazards, including fault rupture, severe ground shaking, liquefaction, landslides, and collapsible or expansive soils. Particular attention should be paid to areas within Alquist-Priolo Earthquake Fault Zones.

Policy 5–5.2 Require all construction to be in conformance with the California Building Code (CBC), and to be consistent with the Municipal Code as it provides for earthquake resistant design, excavation, and grading.

Rialto Airport Specific Plan

The Rialto Airport Specific Plan was adopted by the City in November 1997. The Rialto Municipal Airport ceased operations in 2014 and the former airport property and many of the properties adjacent to the Rialto Municipal Airport that were suited to accommodate development were removed from the Rialto Airport Specific Plan and incorporated into the Renaissance Specific Plan, which was adopted by the City in 2010. Although the Rialto Municipal Airport is no longer operational, the Rialto Airport Specific Plan serves as the zoning ordinance for parcels that were not removed; these parcels are primarily northwest, west, and east of the former Rialto Municipal Airport. The Rialto Airport Specific Plan also provides a framework to guide future land use and development decisions in this area. The Rialto Airport Specific Plan does not contain specific policies related to geology and soils.

City of Rialto Municipal Code

Title 15: Building and Construction. Title 15 of the Rialto Municipal Code identifies the City's building and construction requirements and permitting process, including provisions related to seismic safety, soil erosion, excavation, and grading.

4.6.3 Existing Conditions

Project Setting

The approximately 40-acre project site is mostly vacant and contains scattered, small bushes, weeds and grass and remains of a munitions bunker on the southwestern corner; see **Figure 3-2: Project Vicinity Map**. The site is relatively flat and generally slopes from the northwest to southeast with elevations ranging from 1,612 to 1,649 above mean sea level (msl). The project site is vacant and undeveloped except for the northern and southern portions which appear to have been graded.

Regional Geologic Setting

The project site is located within the Rialto-Colton Subbasin near the northwestern boundary of the Peninsular Ranges Geomorphic Province of Southern California. The Peninsular Ranges Geomorphic Province consists of a series of topographical features moving northwesterly that abuts the Transverse Ranges Province. Within the Transverse Ranges Province are the San Gabriel and San Bernardino Mountains to the north of the project site (**Appendix G1**). According to the USGS, the project site is within an area denoted as having young deposits of alluvial fans from the late Holocene epoch, containing unconsolidated to slightly consolidated fine and coarse-grained sands and pebble-boulder gravel.[1]

Site Geologic Setting

Geologic Materials. The project site consists of undocumented fills overlying natural soils. The existing fill materials are generally medium dense to very dense and consist of silty sands, gravelly sands, and occasional loose silty sands. The project site's natural soils consist predominately of dense to very dense gravelly sands and sandy gravels, and occasional medium dense to very dense sands and silty sands with

[1] USGS. *Geologic Map of the San Bernardino and Santa Ana 30' x 60' Quadrangles, California.* Retrieved from: https://pubs.usgs.gov/of/2006/1217/of2006-1217_map/of2006-1217_geol_map.pdf. Accessed on March 28, 2024.

favorable consolidation/collapse characteristics along with occasional cobbles. Scattered boulders were also encountered on the project site.

Groundwater. Borings reaching down to a maximum depth of 25 feet below ground surface did not encounter groundwater. The depth to historically high ground water levels in the vicinity of the project site is approximately 279 feet below the ground surface recorded in 1993 (**Appendix F1**). According to the Phase I ESA conducted for the Project, groundwater in 2022 has been recorded at a depth of 460 feet below ground surface in the Project vicinity and is anticipated to be in excess of 400 feet below ground surface at the project site (**Appendix G1**).

Corrosive Soils. The project site soils are considered not corrosive to ferrous metals.

Seismically Induced Settlement. The project site is not located in a Seismic Hazards Zone for liquefaction nor earthquake induced landslide zones. Further, on-site natural soils are dense and not inclined to having potential for seismic induced settlement.

Faulting and Seismicity

There are no known active or potentially active faults within the project site, including Alquist-Priolo Earthquake Fault Zones. However, there are numerous active faults located in the regional area. Active and potentially active faults proximate to the project site are identified on **Table 4.6-1: Regional Faults and Seismicity**. Major faults delineated as Alquist-Priolo Fault Zones are approximately 1.4, 2.5, and 4.8 miles from the project site, and include the San Jacinto fault zone, San Andreas fault zone, and Cucamonga fault zone. The closest fault, the San Jacinto fault is located approximately 1.4 miles east of the project site. This San Jacinto fault is part of the larger Sierra Madre-Cucamonga fault system and is considered to be a blind thrust fault. Blind thrust faults are fault areas that do not intersect the ground surface and therefore are not classified as active or potentially active in the same manner as faults that are present at the earth's surface. Blind thrust faults are "buried" under the uppermost layers of rock in the crust.

Table 4.6-1: Regional Faults and Seismicity

Fault Segment	Approximate Distance from Project Site (miles)	Direction From Site	Probable Moment Magnitudes (M_W)
San Jacinto	1.4	East	6.5-7.5
San Andreas	4.8	North/Northeast	6.8-8.0
Cucamonga	2.5	Northwest	6.0-7.0

Surface Fault Rupture. Fault rupture is the surface displacement that occurs when movement on a fault deep within the earth breaks through to the surface. Fault rupture and displacement almost always follows preexisting faults, which are zones of weakness; however, not all earthquakes result in surface rupture (i.e., earthquakes that occur on blind thrusts do not result in surface fault rupture. Rupture may occur suddenly during an earthquake or slowly in the form of fault creep). In addition to damage caused by ground shaking from an earthquake, fault rupture is also damaging to buildings and other structures due to the differential ground surface displacement and deformation that occurs from the fault offset. This leads to damage or collapse of structures across this zone. Fault rupture displacements in large earthquakes can range from several feet to greater than 15 feet. Surface fault rupture would not occur at the project site due to no known active or potentially active faults that cross the project site.

Ground Shaking. An earthquake is classified by the amount of energy released, which traditionally has been quantified using the Richter scale (M_L). However, seismologists most commonly use the Moment Magnitude (M_W) scale because it provides a more accurate measurement for major and great earthquake sizes For earthquakes of less than M_W 7.0, the Moment and Richter Magnitude scales are nearly identical. For earthquake magnitudes greater than M_W 7.0, readings on the Moment Magnitude scale are slightly greater than a corresponding Richter Magnitude.

The intensity of seismic shaking, or strong ground motion, during an earthquake is dependent on the distance between a site and the earthquake epicenter, the magnitude, and the geologic conditions underlying and surrounding a site. Earthquakes occurring on faults closest to a project site would most likely generate the largest ground motion. However, there are no known active or potentially active faults that cross the project site.

Liquefaction. Liquefaction tends to occur in loose, saturated fine-grained sands, course silts, or clays with low plasticity. The liquefaction process typically occurs at depths less than 50 feet below the ground surface, although liquefaction can occur at deeper intervals, given the right conditions. The most susceptible zone occurs at depths shallower than 30 feet below the ground surface.

For liquefaction to occur, there must be proper soil type, soil saturation, and cyclic accelerations of sufficient magnitude to progressively increase the water pressures within the soil mass. Non-cohesive soil shear strength is developed by the point-to-point contact of soil grains. As the water pressures increase in the void spaces surrounding the soil grains, soil particles become supported more by water than point-to-point contact. When water pressures increase sufficiently, soil grains lose the strength to hold to each other and the soils begin to liquefy.

Liquefaction can lead to several types of ground failure, depending on slope conditions and the geological and hydrological settings. The four most common types of ground failure are lateral spreads, flow failures, ground oscillation, and loss of bearing strength.

The site is not located in a zone identified as having a potential for liquefaction by the County of San Bernardino.[2] As noted above, borings conducted on-site reached a maximum depth of 25 feet below ground surface and did not encounter groundwater (**Appendix F1**). Further, according to the Phase I ESA conducted for the Project, groundwater in 2022 has been recorded at a depth of 460 feet below ground surface in the Project vicinity and is anticipated to be in excess of 400 feet below ground surface at the project site (**Appendix G1**). Therefore the project site's soils are not susceptible to liquefaction and the potential for liquefaction at the site is low.

Landslides. Landslides are gravity-driven movements of earth materials that may include rock, soil, unconsolidated sediment, or combinations of such materials. The primary factors influencing the stability of a slope are the nature of underlying soil or bedrock, the slope geometry (height and steepness), and rainfall. The presence of historic landslide deposits is a good indicator of future landslides. Landslides are commonly triggered by unusually high rainfall and the resulting soil saturation, by earthquakes, or a

[2] County of San Bernardino. 2020. *HZ-2 Liquefaction and Landslides*. Retrieved from: https://www.arcgis.com/apps/webappviewer/index.html?id=5864a434814c4e53adc74101b34b1905. Accessed July 15, 2024.

combination of these conditions. The project site is not located in a zone identified by the County of San Bernardino as being susceptible to landslides.[3]

Lateral Spreading. Lateral spreading generally is a phenomenon where blocks of intact, non-liquefied soil move downslope on a liquefied substrate of large areal extent. For lateral spreading to occur, a sloping site with an open face within or at some distance from the site typically exists and there is a potential for liquefaction to occur near the base of the open face. Since the potential for liquefaction to occur at the site is low, the potential for lateral spreading is also low.

Soil Expansion. Expansive soils can undergo significant volume change with changes in moisture content. In general, expansive soils shrink and harden when dried and swell and soften when wetted. Such changes can cause distress to building foundations and structures, slabs on grade, pavements, and other surface improvements. Expansive soils contain minerals such as clays, which are capable of absorbing water. The project site's natural soils consist predominately of silty sands and gravelly sands with no appreciable clay content. Although not tested, these soils are considered to have a very low expansion potential.

Subsidence. The project site is located within a widespread area of recorded subsidence due to groundwater withdrawal/pumping (historical and current) across California.[4] Subsidence is a potential hazard in areas where there are significant thicknesses of alluvial soils and where groundwater withdrawal is anticipated. As noted above, the Phase I ESA conducted for the Project, estimates groundwater to be in excess of 400 feet below ground surface at the project site (**Appendix G1**).

Soils encountered at the boring and trench locations indicate that the project site is underlain by artificial fill and alluvium (**Appendix F1**). The artificial fill soils were encountered at ground surface and extended to depths of 2 to 4 feet below site grades and generally consisted of medium dense to very dense silty sands and gravelly sands, and occasional loose silty sands. Alluvium soils were also encountered at ground surface and beneath the artificial fill soils extending to the maximum depth explored at 25 feet below site grades. Alluvium generally consists of dense to very dense gravelly sands and sandy gravels, and occasional medium dense to very dense sands and silty sands. The Geotechnical Investigation concluded the potential for subsidence to effect the site is considered low (**Appendix F1**).

Paleontological Resources

Paleontological resources are the fossilized remains of organisms from prehistoric environments found in geologic strata. These resources are valued for the information they yield about the history of the Earth and its past ecological settings. The potential for fossil occurrence depends on the rock type exposed at the surface in a given area.

The City of Rialto General Plan EIR identifies surface exposures of several sedimentary units. Of these units, mapped surface Pleistocene deposits are identified to have high paleontological sensitivity as other units across the region have been reported to yield significant fossils of extinct animals from the Ice Age.[5] According to the Rialto General Plan Draft EIR Exhibit 4.6.2, the project site contains young alluvial fan deposits, which have low paleontological sensitivity. Further, additional alluvial subsurface Holocene sand and gravel deposits may be encountered as indicated in the paleontological records search. While

[3] Ibid.

[5] City of Rialto. 2010. *Rialto General Plan EIR*. pg. 114. Accessed 2024.

Holocene soils are not paleontologically sensitive, underlying older soils that are highly sensitive such as soils from the earliest parts of the Holocene and late Pleistocene era may be present.

4.6.4 Methodology

The technical analyses supporting the geotechnical impact conclusions in the following section and the paleontological impact analysis used data provided in **Appendix F1, Appendix F2,** and **Appendix F3**. Data from these reports was supplemented through literature review and application of policies and guidelines of the General Plan for geology, soils, and paleontological resources.

The proposed Project is evaluated against the significance criteria/thresholds, as the basis for determining the impact's level of significance concerning geology and soils. In addition to project design features, this analysis considers the existing regulatory framework (i.e., laws, ordinances, regulations, and standards) that avoid or reduce a potentially significant environmental impact. Where significant impacts remain despite compliance with the regulatory framework, feasible mitigation measures are recommended, where warranted, to avoid or reduce the proposed Project's potentially significant environmental impacts.

4.6.5 Thresholds of Significance

The following significance criteria for geology and soils, and paleontological resources were derived from the Environmental Checklist in CEQA Guidelines Appendix G. The proposed Project would result in a significant impact related to geology and soils, or paleontological resources if it would:

- Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking.
- Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure including liquefaction.
- Result in substantial soil erosion or the loss of topsoil.
- Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse.
- Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property.
- Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.

As addressed in **Section 5.1: Effects Found Not to be Significant**, the City has determined that the proposed Project would not have a significant impact on the following thresholds for the reasons stated below, and that no further analysis was required in the EIR:

- Would the Project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving the rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

There are no known active or potentially active faults at the project site, and the site is not within an Alquist-Priolo Earthquake Fault Zone as designated by the CGS. The closest known fault to the site is the San Jacinto fault, which is mapped about 1.4 miles to the northeast. Therefore, the Project would not

directly, or indirectly, cause potential substantial adverse effects involving rupture of a known earthquake fault.

- Would the Project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving landslides?

The project site has an average elevation of approximately 1,620 feet above mean sea level. Due to the area's relatively flat topography, landslides are not anticipated. The project site is not located in a zone identified as being susceptible to landslides by the County of San Bernardino.[6] Therefore, given landslides are not anticipated due to the project site's location and topography, Project implementation would not expose people or structures to potential substantial adverse effects involving landslides, and no loss, injury, or death involving landslides would occur.

- Would the Project have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?

The Project would connect to the City's existing sewer system and would not include the use of septic tanks or alternative wastewater disposal systems. Therefore, the Project would have no impact concerning soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater. **Section 4.17: Utilities** of this EIR addresses wastewater service and facilities.

4.6.6 Project Impacts and Mitigation

Threshold 4.6-1:	**Would the Project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking?** ***Level of Significance:*** Less than Significant Impact

While there are no known active or potentially active faults or Alquist-Priolo Earthquake Fault Zones at the project site, there are numerous faults in the region. Rupture of any of these faults or of an unknown fault in the region could cause seismic ground shaking.

State laws and local ordinances require that, prior to construction, potential seismic hazards be identified and mitigated, as needed, to protect public health and safety from substantial risks through appropriate engineering practices. Project construction would be required to conform to CBC and California Health and Safety Code seismic design requirements (or applicable adopted code at the time of plan submittal or grading and building permit issuance for construction). The building and safety standards established by these codes have been developed to address structural integrity during a seismic event. To further reduce potential impacts associated with seismic activity, the Project would implement Standard Condition (SC) GEO-1, which would require the Project Applicant to provide a site-specific, design-level geotechnical investigation for review and approval to the City of Rialto Community Development Department and Public Works Department. The City would review all Project plans for grading, foundation, structural, infrastructure, and all other relevant construction permits relative to the Preliminary Geotechnical Investigation's recommendations and code requirements. The project site is not

[6] County of San Bernardino. 2020. *HZ-2 Liquefaction & Landslides*. Retrieved from: https://www.arcgis.com/apps/webappviewer/index.html?id=5864a434814c4e53adc74101b34b1905. Accessed July 14, 2024.

traversed by an active fault. With the implementation of SC GEO-1 and considering the Project would comply with applicable seismic design requirements, impacts associated with strong seismic ground shaking would be less than significant.

Threshold 4.6-2:	**Would the Project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction?**
	Level of Significance: Less than Significant Impact

The project site is not located in a zone identified as having a potential for liquefaction by the County of San Bernardino. As noted above, according to the Phase I ESA conducted for the Project, in 2022 groundwater was recorded at a depth of 460 feet below ground surface in the vicinity of the project site and is anticipated to be in excess of 400 feet below ground surface at the project site (**Appendix G1**). Thus, groundwater is considered too deep to induce liquefaction on the project site near surface soils. In addition, the project site is underlain by dense and very dense coarsely granular alluvial fan deposits, which are soils less susceptible to liquefaction.[7] Therefore, liquefaction potential is considered low due to soil composition and deep groundwater depth.

As previously addressed, State laws and local ordinances require that, prior to construction, potential seismic hazards be identified and mitigated, as needed, to protect public health and safety from substantial risks through appropriate engineering practices. Project construction would be required to conform to CBC and California Health and Safety Code seismic design requirements (or applicable adopted code at the time of plan submittal or grading and building permit issuance for construction). The building and safety standards established by these codes have been developed to address structural integrity during a seismic event. To further reduce potential impacts associated with seismic activity, the Project would implement SC GEO-1, which would require the Project Applicant to provide a site-specific, design-level geotechnical investigation for review and approval to the City of Rialto Community Development Department and Public Works Department. The potential for seismic-related ground failure, including liquefaction would be less than significant and no mitigation is required.

Threshold 4.6-3:	**Would the Project result in substantial soil erosion or the loss of topsoil?**
	Level of Significance: Less than Significant Impact

Soil erosion occurs when surface materials are worn away from the earth's surface due to land disturbance and/or natural factors such as wind and precipitation. The potential for soil erosion is determined by characteristics including soil texture and content, surface roughness, vegetation cover, and slope grade and length. Wind erosion typically occurs when fine-grained non-cohesive soils are exposed to high-velocity winds, while water erosion tends to occur when loose soils on moderate to steep slopes are exposed to high-intensity storm events.

On-site surface soils consist predominately of artificial fill with silt sands and gravelly sands, and occasional loose silty sands in addition to natural alluvial soils consisting of dense gravelly sands and sandy gravels with varying amounts of gravel and cobbles. These materials have a relatively low to moderate potential

[7] As identified by boring samples in **Appendix F2**.

for water erosion depending on drainage patterns. The Project would also require cuts and fills of surface soils to remove existing undocumented artificial fill thereby reducing the potential for such erosion by removing loose soils. During grading and construction, topsoil would be exposed resulting in potential wind and water erosion. However, the Project would be required to comply with the NPDES permitting process which would minimize soil erosion. **Section 4.9: Hydrology and Water Quality** identifies the NPDES compliance requirements for the Project. The NPDES permit would require the Project to prepare and implement a SWPPP and erosion control plan that includes construction erosion-controlling BMPs. Typical SWPPP erosion BMPs include, but are not limited to, stabilization of construction entrances, straw wattles on embankments, and sediment filters on existing inlets. These BMPs would protect exposed slope areas, control surface water flows over exposed soils, and implement a sediment monitoring plan.[8] Therefore, given that compliance with applicable State and federal regulations (i.e., the NPDES Construction General Permit) would minimize soil erosion and topsoil loss, Project construction soil erosion and topsoil loss would be relatively low and impacts would be less than significant and no mitigation is required.

Following site development, the project site would be primarily impervious surfaces. Upon completion of construction, the project site would be substantially covered with pavement, buildings, and landscaping that would reduce the potential for wind and water erosion during operations. Pervious areas would be landscaped to prevent soil erosion; the remainder of the project site would be impervious and therefore not subject to soil erosion. Accordingly, the Project would not result in substantial soil erosion or loss of topsoil. As a result, impacts associated with soil erosion and loss of topsoil would be less than significant and no mitigation is required.

Threshold 4.6-4:	**Would the Project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?**
	Level of Significance: Less than Significant Impact

Landslides. As noted above, the project site is not subject to landslides due to location and topography. In addition, the project site is not located in a zone identified as being susceptible to landslides by the County of San Bernardino.[9] Therefore, given no landslides would occur due to project site and area location and topography, there would be no impact as a result of landslides and no mitigation is required.

Lateral Spreading. Lateral spreading is the finite, horizontal movement of material associated with pore pressure build-up or liquefaction. This process can occur in a shallow underlying deposit during an earthquake in areas susceptible to liquefaction. To occur, lateral spreading requires the existence of a continuous and laterally unconstrained liquefiable zone. Given the very low probability of liquefaction, impacts from lateral spreading would be less than significant and no mitigation is required.

Subsidence. Soil subsidence is characterized by sinking or descending soils that occur as the result of a heavy load being placed on underlying sediments and may be triggered by seismic events. Seismically-induced settlement depends on the relative subsurface soil density. Settlements from collapsible soils can be relatively large and damaging to improvements. Site soils are mainly dense with occasional loose soil

[8] Rialto, California Municipal Code Section 17.40.010 (Ord. 1234 (part), 1995: Ord. 684 Section 23, 1975).

[9] County of San Bernardino. 2020. *HZ-2 Liquefaction and Landslides*. Retrieved from: https://www.arcgis.com/apps/webappviewer/index.html?id=5864a434814c4e53adc74101b34b1905. Accessed August 28, 2024.

deposits. Project construction would remove unsuitable soils based the Geotechnical Investigation recommendations per SC GEO-1. Further, Project implementation would not involve groundwater, gas, oil, geothermal energy extraction and therefore would not cause subsidence. Therefore, given that subsidence would not affect the project site due to compliance with SC GEO-1 and existing groundwater depth, impacts would be less than significant and no mitigation is required.

Liquefaction. Liquefaction potential is considerably low due to existing soil composition and groundwater depths. The Geotechnical Investigation makes preliminary recommendations concerning design parameters, foundations, slabs, and general earthwork and grading, among other factors. The City Building Division would review construction plans to verify compliance with standard engineering practices, the CBC, and the Geotechnical Investigation's recommendation, including those concerning subsidence. Following compliance with standard engineering practices, the established regulatory framework (i.e., CBC), and the Geotechnical Investigation's recommendations (SC GEO-1), the Project would not be located on a geologic unit or soil that would become unstable and potentially result in subsidence. Therefore, given that subsidence and liquefaction would not affect the project site due to existing soil characteristics and deep groundwater depth, impacts would be less than significant and no mitigation is required.

Threshold 4.6-5:	**Would the Project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?** ***Level of Significance:*** Less than Significant Impact

Soils that expand and contract in volume ("shrink-swell" pattern) are considered to be expansive and may cause damage to aboveground infrastructure as a result of density changes that shift overlying materials. Fine-grain clay sediments are most likely to exhibit shrink-swell patterns in response to changing moisture levels. According to the Geotechnical Investigation, project site soils include alluvium, artificial fill, and cobbles, which do not include any substantive amount of clay (**Appendix F1**). Therefore, given that soil expansion is unlikely due to the site's existing soil composition, impacts from expansive soils would be less than significant and no mitigation is required.

Threshold 4.6-6:	**Would the Project directly or indirectly destroy a unique paleontological resource or site or unique geological feature?** ***Level of Significance:*** Less than Significant Impact with the incorporation of MM-GEO 1.

A paleontological records search conducted by Western Science Center was prepared for the Project on May 13, 2024, which indicates that no known fossil localities have been recorded at the project site; see **Appendix F3**. The project site contains surface artificial fill underlain by Holocene-aged younger alluvium. These Holocene alluvial deposits are considered too young to potentially yield paleontological resources. Therefore, the project site's underlying soils have low paleontological sensitivity. As such, it is considered unlikely that unknown paleontological resources would be unearthed during Project implementation. However, if development requires any substantial depth of disturbance, the likelihood of reaching Pleistocene alluvial sediments would increase.

In the event previously unknown paleontological resources are unearthed during Project construction, significant impacts could occur. MM GEO-1 requires the retention of a qualified paleontologist to monitor the site on an as-needed basis. With the implementation of MM GEO-1, potential impacts to paleontological resources would be reduced to a less than significant level.

4.6.7 Cumulative Impacts

Geology and Soils. Southern California is a seismically active region with a range of geological and soil conditions. These conditions can vary widely within a limited geographical area due to factors, including differences in landforms and proximity to fault zones, among others. Therefore, while geotechnical impacts may be associated with the cumulative development, by the impacts' very nature (i.e., landslides and expansive and compressible soils), the constraints are typically site-specific and there is a low, if any, cumulative relationship between the development of a proposed project and development within a larger cumulative area, such as citywide development. Additionally, while seismic conditions are regional in nature, seismic impacts on a given project site are site-specific. For example, development within the site or surrounding area would not alter geologic events or soil features/characteristics (such as ground-shaking, seismic intensity, or soil expansion); therefore, the Project would not affect the level of intensity at which a seismic event on an adjacent site is experienced. However, Project development and future development in the area may expose more persons to seismic hazards.

In accordance with the thresholds of significance, impacts associated with seismic events and hazards would be considered significant if the effects of an earthquake on a property could not be mitigated by an engineered solution. The significance criteria do not require elimination of structural damage potential from seismic hazards. Instead, the criteria require an evaluation of whether the seismic conditions on a site can be overcome through engineering design solutions that would reduce the substantial risk of exposing people or structures to loss, injury, or death to less than significant.

The project site is not in an Alquist-Priolo Earthquake Fault Zone, or landslide, liquefaction, or preliminary fault rupture study area. In addition, the proposed Project would be constructed in compliance with applicable codes and in accordance with the Mitigation Program set forth in this EIR, which are designed to reduce the exposure of people or structures to substantial risk of loss, injury, or death related to geological conditions or seismic events.

Accordingly, the Project's contribution to any cumulative impact related to the exposure of people or structures to potential substantial adverse effects involving fault rupture, ground shaking, or ground failure, as well as unstable geologic units or expansive soil, would not be cumulatively considerable and the cumulative impact would be reduced to a level of less than significant.

Similar to the Project, future projects would be required to follow City of Rialto Building standards, SCAQMD's requirements for dust control, and Regional Water Quality Control Board regulations pertaining to surface water runoff and water quality (which would require BMPs) for construction projects greater and smaller than one acre of disturbance, would prevent significant cumulative impacts related to erosion and other geological impacts. Therefore, the Project's contribution to any cumulative impact related to soil erosion would not be cumulatively considerable and the cumulative impact would be reduced to a level of less than significant.

Paleontology. Cumulative impacts related to paleontological resources are typically site-specific. The analysis herein determined that the proposed Project could result in potentially significant impacts related

to the destruction of a previously unknown unique paleontological resource given that the project site may contain soils conducive for such resources. MM GEO-1 would address this potential as it requires the retention of a qualified paleontologist for monitoring and therefore would reduce impacts to less than significant. Therefore, the Project would not result in incremental effects to paleontology that could be compounded or increased when considered together with similar effects from other past, present, and reasonably foreseeable probable future projects. Therefore, with inclusion of the above referenced mitigation measure, the Project would not result in a cumulatively considerable impact.

4.6.8 Mitigation Program

Standard Conditions

SC GEO-1: The Applicant shall submit to the City of Rialto Community Development Department and Public Works Department for review and approval, a site-specific design-level geotechnical investigation prepared for the project site by a registered geotechnical engineer. The investigation shall comply with all applicable State and local code requirements[10] and:

a) Include an analysis of the expected ground motions at the site from known active faults using accepted methodologies;

b) Determine structural design requirements as prescribed by the most current version of the California Building Code, including applicable City amendments, to ensure that structures can withstand ground accelerations expected from known active faults; and

c) Determine the final design parameters for walls, foundations, foundation slabs, utilities, roadways, parking lots, sidewalks, and other surrounding related improvements.

Project plans for foundation design, earthwork, and site preparation shall incorporate all of the mitigation in the site-specific investigations. The structural engineer shall review the site-specific investigations, provide any additional necessary measures to meet Building Code requirements, and incorporate all applicable recommendations from the investigation in the structural design plans and shall ensure that all structural plans for the Project meet current Building Code requirements.

The City's registered geotechnical engineer or third-party registered engineer retained to review the geotechnical reports shall review each site-specific geotechnical investigation, approve the final report, and require compliance with all geotechnical requirements contained in the investigation in the plans submitted for the grading, foundation, structural, infrastructure and all other relevant construction permits.

The City shall review all Project plans for grading, foundations, structural, infrastructure and all other relevant construction permits to ensure compliance with the applicable geotechnical investigation and other applicable Code requirements.

[10] Rialto, CA Municipal Code Section 11.12.070 (Ord. 1234 (part), 1995: Ord. 649 §1 (part), 1973: 1965 Code Title XIII, Ch. 11, §7). Accessed September 5, 2024.

Mitigation Measures

MM GEO-1 **Paleontological Monitoring.** Prior to the issuance of any grading permits, or any permit authorizing ground disturbance, the Project Applicant shall, to the satisfaction of the City of Rialto Community Development Director, demonstrate that a qualified paleontologist has been retained to respond on an as-needed basis to address unanticipated paleontological discoveries. A paleontologist is defined as an individual with an M.S./M.A. or Ph.D. in paleontology or geology who is familiar with paleontological procedures and techniques, and who is knowledgeable in the geology and paleontology of the area.

In the event that fossils or fossil-bearing deposits are inadvertently unearthed during excavation and grading activities, all earth disturbing activities within a 100-foot radius of the area of discovery shall be temporarily halted or diverted. The qualified paleontologist shall be contacted to evaluate the significance of the finding and determine an appropriate course of action in accordance with Society of Vertebrate Paleontology standards and assess the significance of the find under the criteria set forth in CEQA Guidelines Section 15064.5. The paleontologist shall notify the appropriate agencies to determine procedures that would be followed before construction is allowed to resume at the location of the find. If in consultation with the paleontologist, City staff and the Project Applicant determine that avoidance is not feasible, the paleontologist shall prepare an excavation plan for reducing the effect of the Project on the qualities that make the resource important. The plan shall be submitted to the City for review and approval and the Project Applicant shall implement the approval plan.

4.6.9 Level of Significance After Mitigation

With implementation of the Mitigation Program set forth in this section, potential impacts related to geology and soils, and paleontological resources would be reduced to a level considered less than significant.

4.7 GREENHOUSE GAS EMISSIONS

4.7.1 Introduction

This section of the EIR discusses potential greenhouse gas (GHG) emission impacts associated with development and implementation of the Project. A quantified estimate of GHG emissions that would result from the Project, and an analysis of the significance of the impact of these GHGs were analyzed. In the case where impacts were found to be potentially significant, mitigation is proposed to reduce their significance. The current conditions were observed as the baseline for the analysis along with relevant federal, State, and local air pollutant regulations. GHG emissions modeling for the proposed Project is included in **Appendix G: GHG Emissions Modeling Data** of this EIR.

4.7.2 Regulatory Setting

Federal Regulations

To date, national standards have not been established for nationwide GHG reduction targets, nor have any regulations or legislation been enacted specifically to address climate change and GHG emissions reduction at the project level. Various efforts have been promulgated at the federal level to improve fuel economy and energy efficiency to address climate change and its associated effects.

Energy Independence and Security Act of 2007

The Energy Independence and Security Act of 2007 (December 2007), among other key measures, requires the following, which would aid in the reduction of national GHG emissions:

- Increase the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard requiring fuel producers to use at least 36 billion gallons of biofuel in 2022.
- Set a target of 35 miles per gallon for the combined fleet of cars and light trucks by model year 2020 and direct the National Highway Traffic Safety Administration (NHTSA) to establish a fuel economy program for medium- and heavy-duty trucks and create a separate fuel economy standard for work trucks.
- Prescribe or revise standards affecting regional efficiency for heating and cooling products and procedures for new or amended standards, energy conservation, energy efficiency labeling for consumer electronic products, residential boiler efficiency, electric motor efficiency, and home appliances.

U.S. Environmental Protection Agency Endangerment Finding

The U.S. Environmental Protection Agency (U.S. EPA) authority to regulate GHG emissions stems from the U.S. Supreme Court decision in *Massachusetts v. EPA* (2007). The Supreme Court ruled that GHGs meet the definition of air pollutants under the existing Federal Clean Air Act (FCAA) and must be regulated if these gases could be reasonably anticipated to endanger public health or welfare. Responding to the Court's ruling, the U.S. EPA finalized an endangerment finding in December 2009. Based on scientific evidence it found that six GHGs (CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6) constitute a threat to public health and welfare. It is the Supreme Court's interpretation of the existing FCAA and the U.S. EPA's assessment of the scientific evidence that form the basis for the U.S. EPA's regulatory actions.

Federal Vehicle Standards

In response to the U.S. Supreme Court ruling discussed above, Executive Order 13432 was issued in 2007 directing the U.S. EPA, the Department of Transportation, and the Department of Energy to establish regulations that reduce GHG emissions from motor vehicles, non-road vehicles, and non-road engines by 2008. In 2009, the NHTSA issued a final rule regulating fuel efficiency and GHG emissions from cars and light-duty trucks for model year 2011, and in 2010, the U.S. EPA and NHTSA issued a final rule regulating cars and light-duty trucks for model years 2012–2016.

In 2010, an Executive Memorandum was issued directing the Department of Transportation, Department of Energy, U.S. EPA, and NHTSA to establish additional standards regarding fuel efficiency and GHG reduction, clean fuels, and advanced vehicle infrastructure. In response to this directive, the U.S. EPA and NHTSA proposed stringent, coordinated federal GHG and fuel economy standards for model years 2017–2025 light-duty vehicles. The proposed standards projected to achieve 163 grams per mile of CO_2 in model year 2025, on an average industry fleet-wide basis, which is equivalent to 54.5 miles per gallon if this level were achieved solely through fuel efficiency. The final rule was adopted in 2012 for model years 2017–2021, and NHTSA intends to set standards for model years 2022–2025 in a future rulemaking. On January 12, 2017, the U.S. EPA finalized its decision to maintain the current GHG emissions standards for model years 2022–2025 cars and light trucks. It should be noted that the U.S. EPA is currently proposing to freeze the vehicle fuel efficiency standards at their planned 2020 level (37 miles per gallon [mpg]), canceling any future strengthening (currently 54.5 mpg by 2026).

In addition to the regulations applicable to cars and light-duty trucks described above, in 2011, the U.S. EPA and NHTSA announced fuel economy and GHG standards for medium- and heavy-duty trucks for model years 2014–2018. The standards for CO_2 emissions and fuel consumption are tailored to three main vehicle categories: combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles. According to the U.S. EPA, this regulatory program will reduce GHG emissions and fuel consumption for the affected vehicles by 6 to 23 percent over the 2010 baselines.

In August 2016, the U.S. EPA and NHTSA announced the adoption of the phase two program related to the fuel economy and GHG standards for medium- and heavy-duty trucks. The phase two program applies to vehicles with model year 2018 through 2027 for certain trailers, and model years 2021 through 2027 for semi-trucks, large pickup trucks, vans, and all types and sizes of buses and work trucks. The final standards lower CO_2 emissions by approximately 1.1 billion metric tons and reduce oil consumption by up to two billion barrels over the lifetime of the vehicles sold under the program.

On September 27, 2019, the U.S. EPA and the NHTSA published the "Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule Part One: One National Program" (84 Fed. Reg. 51,310 (Sept. 27, 2019). The SAFE Rule (Part One) revoked California's authority to set its own GHG emissions standards and set zero-emission vehicle mandates in California. On March 31, 2020, the U.S. EPA and NHTSA finalized rulemaking for SAFE Part Two, which sets CO_2 emissions standards and corporate average fuel economy (CAFE) standards for passenger vehicles and light duty trucks, covering model years 2021-2026. The current U.S. EPA administration repealed SAFE Rule Part One, effective January 28, 2022, and is reconsidering Part Two.

As of April 1, 2022, the CAFE standards require an industry-wide fleet average of approximately 49 mpg for passenger cars and light trucks in model year 2026. The new CAFE standards for model year 2024-2026

will reduce fuel use by more than 200 billion gallons through 2050, as compared to continuing under the old standards.[1]

State Regulations

California Air Resources Board

The California Air Resources Board (CARB) is responsible for the coordination and oversight of State and local air pollution control programs in California. Various statewide and local initiatives to reduce California's contribution to GHG emissions have raised awareness about climate change and its potential for severe long-term adverse environmental, social, and economic effects. California is a significant emitter of CO_2 equivalents (CO_2e) in the world and produced 459 million gross metric tons of CO_2e in 2013. In the State, the transportation sector is the largest emitter of GHGs, followed by industrial operations such as manufacturing and oil and gas extraction.

The State of California legislature has enacted a series of bills that constitute the most aggressive program to reduce GHGs of any state in the nation. Some legislation, such as the landmark Assembly Bill (AB) 32, California Global Warming Solutions Act of 2006, was specifically enacted to address GHG emissions. Other legislation, such as Title 24 building efficiency standards and Title 20 appliance energy standards, were originally adopted for other purposes such as energy and water conservation but also provide GHG reductions. This section describes the major provisions of the legislation.

Assembly Bill 32 (California Global Warming Solutions Act of 2006)

AB 32 instructs the CARB to develop and enforce regulations for the reporting and verification of statewide GHG emissions. AB 32 also directed CARB to set a GHG emissions limit based on 1990 levels, to be achieved by 2020. It set a timeline for adopting a scoping plan for achieving GHG reductions in a technologically and economically feasible manner.

California Air Resource Board Scoping Plan

CARB adopted the Scoping Plan to achieve the goals of AB 32. The Scoping Plan establishes an overall framework for the measures that would be adopted to reduce California's GHG emissions. CARB determined that achieving the 1990 emissions level would require a reduction of GHG emissions of approximately 29 percent below what would otherwise occur in 2020 in the absence of new laws and regulations (referred to as "business-as-usual").[2] The Scoping Plan evaluates opportunities for sector-specific reductions, integrates early actions and additional GHG reduction measures by both CARB and the State's Climate Action Team, identifies additional measures to be pursued as regulations, and outlines the adopted role of a cap-and-trade program.[3] Additional development of these measures and adoption of the appropriate regulations occurred through the end of 2013. Key elements of the Scoping Plan are:

- Expanding and strengthening existing energy efficiency programs, as well as building and appliance standards.

[1] National Highway Traffic Safety Administration, *USDOT Announces New Vehicle Fuel Economy Standards for Model Year 2024-2026*, available at: https://www.nhtsa.gov/press-releases/usdot-announces-new-vehicle-fuel-economy-standards-model-year-2024-2026.

[2] CARB defines business-as-usual (BAU) in its Scoping Plan as emissions levels that would occur if California continued to grow and add new GHG emissions but did not adopt any measures to reduce emissions. Projections for each emission-generating sector were compiled and used to estimate emissions for 2020 based on 2002–2004 emissions intensities. Under CARB's definition of BAU, new growth is assumed to have the same carbon intensities as was typical from 2002 through 2004.

[3] The Climate Action Team, led by the secretary of the California Environmental Protection Agency, is a group of State agency secretaries and heads of agencies, boards, and departments. Team members work to coordinate statewide efforts to implement global warming emissions reduction programs and the State's Climate Adaptation Strategy.

- Achieving a statewide renewables energy mix of 33 percent by 2020.
- Developing a California cap-and-trade program that links with other programs to create a regional market system and caps sources contributing 85 percent of California's GHG emissions (adopted in 2011).
- Establishing targets for transportation-related GHG emissions for regions throughout California and pursuing policies and incentives to achieve those targets (several sustainable community strategies have been adopted).
- Adopting and implementing measures pursuant to existing State laws and policies, including California's clean car standards, heavy-duty truck measures, the Low Carbon Fuel Standard (amendments to the Pavley Standard adopted 2009; Advanced Clean Car standard adopted 2012), goods movement measures, and the Low Carbon Fuel Standard (adopted 2009).
- Creating targeted fees, including a public goods charge on water use, fees on gases with high global warming potential, and a fee to fund the administrative costs of the State of California's long-term commitment to AB 32 implementation.
- The California Sustainable Freight Action Plan was developed in 2016 and provides a vision for California's transition to a more efficient, more economically competitive, and less polluting freight transport system. This transition of California's freight transport system is essential to supporting the State's economic development in coming decades while reducing pollution.
- CARB's Mobile Source Strategy demonstrates how the State can simultaneously meet air quality standards, achieve GHG emission reduction targets, decrease health risk from transportation emissions, and reduce petroleum consumption over the next fifteen years. The mobile Source Strategy includes increasing zero emission vehicles (ZEV) buses and trucks.

In 2012, CARB released revised estimates of the expected 2020 emissions reductions. The revised analysis relied on emissions projections updated in light of current economic forecasts that accounted for the economic downturn since 2008, reduction measures already approved and put in place relating to future fuel and energy demand, and other factors. This update reduced the projected 2020 emissions from 596 million metric tons of CO_2e ($MMTCO_2e$) to 545 $MMTCO_2e$. The reduction in forecasted 2020 emissions means that the revised business-as-usual reduction necessary to achieve AB 32's goal of reaching 1990 levels by 2020 is now 21.7 percent, down from 29 percent. CARB also provided a lower 2020 inventory forecast that incorporated State-led GHG emissions reduction measures already in place. When this lower forecast is considered, the necessary reduction from business-as-usual needed to achieve the goals of AB 32 is approximately 16 percent.

CARB adopted the first major update to the Scoping Plan on May 22, 2014. The updated Scoping Plan summarized the most recent science related to climate change, including anticipated impacts to California and the levels of GHG emissions reductions necessary to likely avoid risking irreparable damage. It identified the actions California has already taken to reduce GHG emissions and focuses on areas where further reductions could be achieved to help meet the 2020 target established by AB 32. By 2016, California had reduced GHG emissions below 1990 levels, achieving AB 32's 2020 goal four years ahead of schedule.

In 2016, the Legislature passed Senate Bill (SB) 32, which codifies a 2030 GHG emissions reduction target of 40 percent below 1990 levels. With SB 32, the Legislature passed companion legislation, AB 197, which

provides additional direction for developing the Scoping Plan. On December 14, 2017, CARB adopted a second update to the Scoping Plan.[4] The 2017 Scoping Plan details how the State will reduce GHG emissions to meet the 2030 target set by Executive Order B-30-15 and codified by SB 32. Other objectives listed in the 2017 Scoping plan are to provide direct GHG emissions reductions; support climate investment in disadvantaged communities; and support the Clean Power Plan and other Federal actions.

Adopted December 15, 2022, CARB's 2022 Scoping Plan for Achieving Carbon Neutrality (2022 Scoping Plan) sets a path to achieve targets for carbon neutrality and reduce anthropogenic GHG emissions by 85 percent below 1990 levels by 2045 in accordance with AB 1279. To achieve the targets of AB 1279, the 2022 Scoping Plan relies on existing and emerging fossil fuel alternatives and clean technologies, as well as carbon capture and storage. Specifically, the 2022 Scoping Plan focuses on zero-emission transportation; phasing out use of fossil gas use for heating homes and buildings; reducing chemical and refrigerants with high Global Warming Potential (GWP); providing communities with sustainable options for walking, biking, and public transit; displacement of fossil-fuel fired electrical generation through use of renewable energy alternatives (e.g., solar arrays and wind turbines); and scaling up new options such as green hydrogen. The 2022 Scoping Plan sets one of the most aggressive approaches to reach carbon neutrality in the world. Unlike the 2017 Scoping Plan, CARB no longer includes a numeric per capita threshold and instead advocates for compliance with a local GHG reduction strategy (i.e., Climate Action Plan) consistent with CEQA Guidelines Section 15183.5.

The key elements of the *2022 CARB Scoping Plan* focus on transportation. Specifically, the 2022 Scoping Plan aims to rapidly move towards zero-emission transportation (i.e., electrifying cars, buses, trains, and trucks), which constitutes California's single largest source of GHGs. The regulations that impact the transportation sector are adopted and enforced by CARB on vehicle manufacturers and are outside the jurisdiction and control of local governments. The 2022 Scoping Plan accelerates development of new regulations as well as amendments to strengthen regulations and programs already in place.

Included in the 2022 Scoping Plan is a set of Local Actions (2022 Scoping Plan Appendix D) aimed at providing local jurisdictions with tools to reduce GHGs and assist the state in meeting the ambitious targets set forth in the 2022 Scoping Plan. Appendix D to the 2022 Scoping Plan includes a section on evaluating plan-level and project-level alignment with the State's Climate Goals in CEQA GHG analyses. In this section, CARB identifies several recommendations and strategies that should be considered for new development in order to determine consistency with the 2022 Scoping Plan. Notably, this section is focused on Residential and Mixed-Use projects.[5] CARB specifically states that Appendix D does not address other land uses (e.g., industrial) as contemplated by the Project.[6] However, CARB plans to explore new approaches for other land use types in the future.[7] As such, it would be inappropriate to apply the requirements contained in Appendix D of the 2022 Scoping Plan to any land use types other than residential or mixed-use residential development.

CARB Advanced Clean Truck Regulation

CARB adopted the Advanced Clean Truck Regulation in June 2020 requiring truck manufacturers to transition from diesel trucks and vans to electric zero-emission trucks beginning in 2024. By 2045, every

[4] California Air Resources Board, *California's 2017 Climate Change Scoping Plan,* Retrieved from: https://www.arb.ca.gov/cc/scopingplan/scoping_plan_2017.pdf. Accessed August 2024.

[5] California Air Resources Board, *2022 Scoping Plan for Achieving Carbon Neutrality, Appendix D: Local Actions*, Page 21, November 2022.

[6] Ibid.

[7] Ibid.

new truck sold in California is required to be zero-emission. This rule directly addresses disproportionate risks and health and pollution burdens and puts California on the path for an all zero-emission short-haul drayage fleet in ports and railyards by 2035, and zero-emission "last-mile" delivery trucks and vans by 2040. The Advanced Clean Truck Regulation accelerates the transition of zero-emission medium-and heavy-duty vehicles from Class 2b to Class 8. The regulation has two components including a manufacturer sales requirement, and a reporting requirement:

- Zero-Emission Truck Sales: Manufacturers who certify Class 2b through 8 chassis or complete vehicles with combustion engines are required to sell zero-emission trucks as an increasing percentage of their annual California sales from 2024 to 2035. By 2035, zero-emission truck/chassis sales need to be 55 percent of Class 2b – 3 truck sales, 75 percent of Class 4 – 8 straight truck sales, and 40 percent of truck tractor sales.
- Company and Fleet Reporting: Large employers including retailers, manufacturers, brokers and others would be required to report information about shipments and shuttle services. Fleet owners, with 50 or more trucks, would be required to report about their existing fleet operations. This information would help identify future strategies to ensure that fleets purchase available zero-emission trucks and place them in service where suitable to meet their needs.

On January 13, 2025, CARB withdrew its requests for CAA waivers from the U.S. EPA needed to support four adopted vehicle emissions regulations: (1) the Advanced Clean Fleets Regulations; 2) the In-Use Locomotive Regulations; 3) part of the Commercial Harbor Craft and Ocean-Going Vessels At-Berth Regulations; and 4) part of the Transport Refrigeration Unit Engine Standards Regulations. The implementation of these regulations is currently unknown.

Senate Bill 32 (California Global Warming Solutions Act of 2006: Emissions Limit)

Signed into law in September 2016, SB 32 codified the 2030 GHG reduction target in Executive Order B-30-15 (40% below 1990 levels by 2030). The bill authorized CARB to adopt an interim GHG emissions level target to be achieved by 2030. CARB also must adopt rules and regulations in an open public process to achieve the maximum, technologically feasible, and cost-effective GHG reductions.

SB 375 (The Sustainable Communities and Climate Protection Act of 2008)

Signed into law on September 30, 2008, SB 375 provided a process to coordinate land use planning, regional transportation plans, and funding priorities to help California meet the GHG reduction goals established by AB 32. SB 375 requires metropolitan planning organizations to include sustainable community strategies in their regional transportation plans for reducing GHG emissions, aligns planning for transportation and housing, and creates specified incentives for the implementation of the strategies.

AB 1493 (Pavley Regulations and Fuel Efficiency Standards)

AB 1493, enacted on July 22, 2002, required CARB to develop and adopt regulations that reduce GHGs emitted by passenger vehicles and light duty trucks. Implementation of the regulation was delayed by lawsuits filed by automakers and by the U.S. EPA's denial of an implementation waiver. The U.S. EPA subsequently granted the requested waiver in 2009, which was upheld by the U.S. District Court for the District of Columbia in 2011. The regulations establish one set of emission standards for model years 2009–2016 and a second set of emissions standards for model years 2017 to 2025. By 2025, when all rules will be fully implemented, new automobiles will emit 34 percent fewer CO_2e emissions and 75 percent fewer smog-forming emissions.

SB 1368 (Emission Performance Standards)

SB 1368 is the companion bill of AB 32, which directs the California Public Utilities Commission (CPUC) to adopt a performance standard for GHG emissions for the future power purchases of California utilities. SB 1368 limits carbon emissions associated with electrical energy consumed in California by forbidding procurement arrangements for energy longer than 5 years from resources that exceed the emissions of a relatively clean, combined cycle natural gas power plant. The new law effectively prevents California's utilities from investing in, otherwise financially supporting, or purchasing power from new coal plants located in or out of the State. The CPUC adopted the regulations required by SB 1368 on August 29, 2007. The regulations implementing SB 1368 establish a standard for baseload generation owned by, or under long-term contract to publicly owned utilities, for 1,100 pounds of CO_2 per megawatt-hour.

SB 1078, SB 107, and SBX1-2 (Renewable Electricity Standards)

SB 1078 (2002) required California to generate 20 percent of its electricity from renewable energy by 2017. SB 107 (2006) changed the due date to 2010 instead of 2017. On November 17, 2008, then-Governor Arnold Schwarzenegger signed Executive Order S-14-08, which established a Renewable Portfolio Standard target for California requiring that all retail sellers of electricity serve 33 percent of their load with renewable energy by 2020. Executive Order S-21-09 also directed CARB to adopt a regulation by July 31, 2010, requiring the State's load serving entities to meet a 33 percent renewable energy target by 2020. CARB approved the Renewable Electricity Standard on September 23, 2010, by Resolution 10-23. SBX1-2, which codified the 33 percent by 2020 goal.

SB 350 (Clean Energy and Pollution Reduction Act of 2015)

Signed into law on October 7, 2015, SB 350 implemented the goals of Executive Order B-30-15. The objectives of SB 350 are to increase the procurement of electricity from renewable sources from 33 percent to 50 percent (with interim targets of 40% by 2024 and 25% by 2027) and to double the energy efficiency savings in electricity and natural gas end uses of retail customers through energy efficiency and conservation. SB 350 also reorganized the Independent System Operator to develop more regional electricity transmission markets and improve accessibility in these markets, which will facilitate the growth of renewable energy markets in the western United States.

AB 398 (Market-Based Compliance Mechanisms)

Signed on July 25, 2017, AB 398 extended the duration of the Cap-and-Trade program from 2020 to 2030. AB 398 required CARB to update the Scoping Plan and for all GHG rules and regulations adopted by the State. It also designated CARB as the statewide regulatory body responsible for ensuring that California meets its statewide carbon pollution reduction targets, while retaining local air districts' responsibility and authority to curb toxic air contaminants (TACs) and criteria pollutants from local sources that severely impact public health. AB 398 also decreased free carbon allowances over 40 percent by 2030 and prioritized Cap-and-Trade spending to various programs including reducing diesel emissions in impacted communities.

SB 150 (Regional Transportation Plans)

Signed on October 10, 2017, SB 150 aligns local and regional GHG reduction targets with State targets (i.e., 40% below 1990 levels by 2030). SB 150 creates a process to include communities in discussions on how to monitor their regions' progress on meeting these goals. The bill also requires the CARB to regularly report on that progress, as well as on the successes and the challenges regions experience associated with

achieving their targets. SB 150 provides for accounting of climate change efforts and GHG reductions and identify effective reduction strategies.

SB 100 (California Renewables Portfolio Standard Program: Emissions of Greenhouse Gases)

Signed into law in September 2018, SB 100 increased California's renewable electricity portfolio from 50 to 60 percent by 2030. SB 100 also established a further goal to have an electric grid that is entirely powered by clean energy by 2045.

AB 1346 (Air Pollution: Small Off-Road Engines)

Signed into law in October 2021, AB 1346 required CARB to adopt cost-effective and technologically feasible regulations to prohibit engine exhaust and evaporative emissions from new small off-road engines, consistent with federal law, by July 1, 2022. The bill required CARB to identify and, to the extent feasible, make available funding for commercial rebates or similar incentive funding as part of any updates to existing applicable funding program guidelines to local air pollution control districts and air quality management districts to implement to support the transition to zero-emission small off-road equipment operations.

AB 1279 (The California Climate Crisis Act)

AB 1279 establishes the policy of the state to achieve carbon neutrality as soon as possible, but no later than 2045; to maintain net negative GHG emissions thereafter; and to ensure that by 2045 statewide anthropogenic GHG emissions are reduced by at least 85 percent below 1990 levels. The bill requires CARB to ensure that Scoping Plan updates identify and recommend measures to achieve carbon neutrality, and to identify and implement policies and strategies that enable CO_2 removal solutions and carbon capture, utilization, and storage technologies.

SB 1020 (100 Percent Clean Electric Grid)

Signed on September 16, 2022, SB 1020 provides additional goals for the path to the 2045 goal of 100 percent clean electricity retail sales. It creates a target of 90 percent clean electricity retail sales by 2035 and 95 percent clean electricity retail sales by 2040.

SB 905 (Carbon Sequestration Program)

Signed on September 16, 2022, SB 905 establishes regulatory framework and policies that involve carbon removal, carbon capture, utilization, and sequestration. It also prohibits the injection of concentrated carbon dioxide fluid into a Class II injection well for the purpose of enhanced oil recovery.

AB 1757 (Nature-Based Solutions)

Signed on September 16, 2022, AB 1757 requires state agencies to develop a range of targets for natural carbon sequestration and nature-based climate solutions that reduce GHG emissions to meet the 2030, 2038, and 2045 goals which would be integrated into a scoping plan addressing natural and working lands.

Executive Orders Related to GHG Emissions

California's Executive Branch has taken several actions to reduce GHGs using executive orders. Although not regulatory, they set the tone for the State and guide the actions of State agencies. They are not legally enforceable for local governments or the private sector.

Executive Order S-3-05. Executive Order S-3-05 was issued on June 1, 2005, which established the following GHG emissions reduction targets:

- By 2010, reduce GHG emissions to 2000 levels.
- By 2020, reduce GHG emissions to 1990 levels.
- By 2050, reduce GHG emissions to 80 percent below 1990 levels.

The 2050 reduction goal represents what some scientists believe is necessary to reach levels that will stabilize the climate. The 2020 goal was established to be a mid-term target.

Executive Order S-01-07. Issued on January 18, 2007, Executive Order S 01-07 mandated that a statewide goal be established to reduce the carbon intensity of California's transportation fuels by at least 10 percent by 2020. The executive order established a Low Carbon Fuel Standard and directed the Secretary for Environmental Protection to coordinate the actions of the California Energy Commission (CEC), CARB, the University of California, and other agencies to develop and propose protocols for measuring the "life-cycle carbon intensity" of transportation fuels. CARB adopted the Low Carbon Fuel Standard on April 23, 2009.

Executive Order S-13-08. Issued on November 14, 2008, Executive Order S-13-08 facilitated the California Natural Resources Agency development of the 2009 California Climate Adaptation Strategy. Objectives include analyzing risks of climate change in California, identifying, and exploring strategies to adapt to climate change, and specifying a direction for future research.

Executive Order S-14-08. Issued on November 17, 2008, Executive Order S-14-08 expands the State's Renewable Energy Standard to 33 percent renewable power by 2020. Additionally, Executive Order S-21-09 (signed on September 15, 2009) directs CARB to adopt regulations requiring 33 percent of electricity sold in the State come from renewable energy by 2020. CARB adopted the Renewable Electricity Standard on September 23, 2010, which requires 33 percent renewable energy by 2020 for most publicly owned electricity retailers.

Executive Order S-21-09. Issued on July 17, 2009, Executive Order S-21-09 directs CARB to adopt regulations to increase California's RPS to 33 percent by 2020. This builds upon SB 1078 (2002), which established the California RPS program, requiring 20 percent renewable energy by 2017, and SB 107 (2006), which advanced the 20 percent deadline to 2010, a goal which was expanded to 33 percent by 2020 in the 2005 Energy Action Plan II.

Executive Order B-30-15. Issued on April 29, 2015, Executive Order B-30-15 established a California GHG reduction target of 40 percent below 1990 levels by 2030 and directs CARB to update the Climate Change Scoping Plan to express the 2030 target in terms of $MMTCO_2e$. The 2030 target acts as an interim goal on the way to achieving reductions of 80 percent below 1990 levels by 2050, a goal set by Executive Order S-3-05. The executive order also requires the State's climate adaptation plan to be updated every three years and for the State to continue its climate change research program, among other provisions. With the enactment of SB 32 in 2016, the Legislature codified the goal of reducing GHG emissions by 2030 to 40 percent below 1990 levels.

Executive Order B-55-18. Issued on September 10, 2018, Executive Order B-55-18 establishes a goal to achieve carbon neutrality as soon as possible, and no later than 2045, and achieve and maintain net negative emissions thereafter. This goal is in addition to the existing statewide targets of reducing GHG emissions. The executive order requires CARB to work with relevant state agencies to develop a framework for implementing this goal. It also requires CARB to update the Scoping Plan to identify and

recommend measures to achieve carbon neutrality. The executive order also requires state agencies to develop sequestration targets in the Natural and Working Lands Climate Change Implementation Plan.

Executive Order N-79-20. Signed in September 2020, Executive Order N-79-20 establishes as a goal that where feasible, all new passenger cars and trucks, as well as all drayage/cargo trucks and off-road vehicles and equipment, sold in California, will be zero-emission by 2035. The executive order sets a similar goal requiring that all medium and heavy-duty vehicles will be zero-emission by 2045 where feasible. It also directs CARB to develop and propose rulemaking for passenger vehicles and trucks, medium-and heavy-duty fleets where feasible, drayage trucks, and off-road vehicles and equipment "requiring increasing volumes" of new zero emission vehicles (ZEVs) "towards the target of 100 percent." The executive order directs the California Environmental Protection Agency (CalGEM), the California Geologic Energy Management Division, and the California Natural Resources Agency to transition and repurpose oil production facilities with a goal toward meeting carbon neutrality by 2045. Executive Order N-79-20 builds upon the CARB Advanced Clean Trucks regulation, which was adopted by CARB in July 2020.

California Regulations and Building Codes

California has a long history of adopting regulations to improve energy efficiency in new and remodeled buildings. These regulations have kept California's energy consumption relatively flat even with rapid population growth.

Title 20 Appliance Efficiency Regulations. The appliance efficiency regulations (California Code of Regulations (CCR) Title 20, Sections 1601-1608) include standards for new appliances. Twenty-three categories of appliances are included in the scope of these regulations. These standards include minimum levels of operating efficiency, and other cost-effective measures, to promote the use of energy- and water-efficient appliances.

Title 24 Building Energy Efficiency Standards. California's Energy Efficiency Standards for Residential and Nonresidential Buildings (CCR Title 24, Part 6) was first adopted in 1978 in response to a legislative mandate to reduce California's energy consumption. The standards are updated periodically to allow consideration and incorporation of new energy efficient technologies and methods. Energy efficient buildings require less electricity; therefore, increased energy efficiency reduces fossil fuel consumption and decreases GHG emissions. The CEC adopted the 2022 Energy Code on August 11, 2021, which was subsequently approved by the California Building Standards Commission for inclusion into the California Building Standards Code. The 2022 Title 24 standards will result in less energy use, thereby reducing air pollutant emissions associated with energy consumption across California. For example, the 2022 Title 24 standards require efficient electric heat pumps, establish electric-ready requirements for new homes, expand solar photovoltaic and battery storage standards, and strengthen ventilation standards.

Title 24 California Green Building Standards Code. The California Green Building Standards Code (CCR Title 24, Part 11) commonly referred to as the CALGreen Code, is a statewide mandatory construction code developed and adopted by the California Building Standards Commission and the Department of Housing and Community Development. The CALGreen standards require new residential and commercial buildings to comply with mandatory measures under the topics of planning and design, energy efficiency, water efficiency/conservation, material conservation and resource efficiency, and environmental quality. CALGreen also provides voluntary tiers and measures that local governments may adopt that encourage or require additional measures in the five green building topics. The most recent update to the CALGreen Code went into effect on January 1, 2023 (2022 CALGreen). The 2022 CALGreen standards continue to

improve upon the existing standards for new construction of, and additions and alterations to, residential and nonresidential buildings.

Regional and Local Regulations

South Coast Air Quality Management District Rule 2305 (Warehouse Indirect Source Rule)

Rule 2305 was adopted by the South Coast Air Quality Management District (SCAQMD) Governing Board on May 7, 2021, to reduce NO_X and particulate matter emissions associated with warehouses and mobile sources attracted to warehouses. Rule 2305 would also reduce GHG emissions. This rule applies to all existing and proposed warehouses over 100,000 square feet located in the SCAQMD. Rule 2305 requires warehouse operators to track annual vehicle miles traveled associated with truck trips to and from the warehouse. These trip miles are used to calculate a warehouse's Warehouse Actions and Investments to Reduce Emissions (WAIRE) Points Compliance Obligation. WAIRE Points are earned based on emission reduction measures and warehouse operators are required to submit an annual WAIRE Report which includes truck trip data and emission reduction measures. Reduction strategies listed in the WAIRE menu include acquire zero emission (ZE) or near zero emission (NZE) trucks; require ZE/NZE truck visits; require ZE yard trucks; install on-site ZE charging/fueling infrastructure; install on-site energy systems; and install filtration systems in residences, schools, and other buildings in the adjacent community. Warehouse operators that do not earn a sufficient number of WAIRE points to satisfy the WAIRE Points Compliance Obligation would be required to pay a mitigation fee. Funds from the mitigation fee will be used to incentivize the purchase of cleaner trucks and charging/fueling infrastructure in communities nearby.

South Coast Air Quality Management District Thresholds

The SCAQMD formed a GHG California Environmental Quality Act (CEQA) Significance Threshold Working Group to provide guidance to local lead agencies on determining significance for GHG emissions in their CEQA documents. This working group was formed to assist SCAQMD's efforts to develop a GHG significance threshold and is composed of a wide variety of stakeholders including the State Office of Planning and Research, CARB, the Attorney General's Office, a variety of city and county planning departments in the SCAB, various utilities such as sanitation and power companies throughout the SCAB, industry groups, and environmental and professional organizations. The Working Group has proposed a tiered approach to evaluating GHG emissions for development projects where SCAQMD is not the lead agency, wherein projects are evaluated sequentially through a series of "tiers" to determine whether the project is likely to result in a potentially significant impact due to GHG emissions.

With the tiered approach, a project is compared against the requirements of each tier sequentially and would not result in a significant impact if it complies with any tier. Tier 1 excludes projects that are specifically exempt from SB 97 from resulting in a significant impact. Tier 2 excludes projects that are consistent with a GHG reduction plan that has a certified final CEQA document and complies with AB 32 GHG reduction goals. Tier 3 excludes projects with annual emissions lower than a screening threshold. The SCAQMD has adopted a threshold of 10,000 metric tons of CO_2e ($MTCO_2e$) per year for industrial projects and a 3,000 $MTCO_2e$ threshold was proposed for non-industrial projects but has not been adopted. During Working Group Meeting #7 it was explained that this threshold was derived using a 90 percent capture rate of a large sampling of industrial facilities. During Meeting #8, the Working Group defined industrial uses as production, manufacturing, and fabrication activities or storage and distribution (e.g., warehouse, transfer facility, etc.). The Working Group indicated that the 10,000 $MTCO_2e$ per year threshold applies to both emissions from construction and operational phases plus indirect emissions

(electricity, water use, etc.). The SCAQMD concluded that projects with emissions less than the screening threshold would not result in a significant cumulative impact.

Tier 4 consists of three options. Under the Tier 4 first option, SCAQMD initially outlined that a project would be excluded if design features and/or mitigation measures resulted in emissions 30 percent lower than business as usual emissions. However, the Working Group did not provide a recommendation for this approach. The Working Group folded the Tier 4 second option into the third option. Under the Tier 4 third option, a project would be excluded if it was below an efficiency-based threshold of 4.8 $MTCO_2e$ per service population per year. Tier 5 would exclude projects that implement off-site mitigation (GHG reduction projects) or purchase offsets to reduce GHG emission impacts to less than the proposed screening level.

Tier 3 Screening Thresholds

When the tiered approach is applied to a proposed project and the project is found not to comply with Tier 1 or Tier 2, a project's emissions are compared against a screening threshold, as described above, for Tier 3. The screening threshold formally adopted by SCAQMD is an "interim" screening threshold for stationary source industrial projects where the SCAQMD is the lead agency under CEQA. The threshold was termed "interim" because the SCAQMD anticipated that CARB would adopt a statewide significance threshold that would inform and provide guidance to SCAQMD in its adoption of a final threshold. However, no statewide threshold was ever adopted and the interim threshold remains in effect.

For projects for which SCAQMD is not the lead agency, no screening thresholds have been formally adopted. However, the SCAQMD Working Group recommended a threshold of 10,000 $MTCO_2e$/year for industrial projects and 3,000 $MTCO_2e$/year for residential and commercial projects. SCAQMD determined that these thresholds would "capture" 90 percent of GHG emissions from these sectors, "capture" meaning that 90 percent of total emissions from all new projects would be subject to some type of CEQA analysis (i.e., found potentially significant).[8]

Southern California Association of Governments

On April 4, 2024, SCAG's Regional Council adopted the *2024-2050 Regional Transportation Plan/Sustainable Communities Strategy* [RTP/SCS] or Connect SoCal. The RTP/SCS charts a course for closely integrating land use and transportation so that the region can grow smartly and sustainably. The strategy was prepared through a collaborative, continuous, and comprehensive process with input from local governments, county transportation commissions, tribal governments, non-profit organizations, businesses and local stakeholders within the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. The RTP/SCS is a long-range vision plan that balances future mobility and housing needs with economic, environmental, and public health goals. The SCAG region strives toward sustainability through integrated land use and transportation planning. The SCAG region must achieve specific federal air quality standards and is required by state law to lower regional GHG emissions.

[8] SCAQMD, *"Staff Report: Interim CEQA GHG Significance Threshold for Stationary Sources, Rules and Plans,"* December 5, 2008, Attachment E: "Draft Guidance Document – Interim CEQA Greenhouse Gas (GHG) Significance Threshold," October 2008, page 3-2.

Rialto General Plan

General Plan Chapter 2, *Managing Our Land Supply*, identifies goals related to greenhouse gas emissions in the City. The following includes General Plan goals and policies that have been adopted by the City for the purpose of avoiding or mitigating an environmental effect and are applicable to the proposed Project.[9]

Goal 2-31	**Incorporate green building and other sustainable building practices into development projects.**
Policy 2.31.1	Explore and adopt the use of green building standards and Leadership in Energy and Environmental Design (LEED) or similar in both private and public projects.
Policy 2-31.2	Promote sustainable building practices that go beyond the requirements of Title 24 of the California Administrative Code, and encourage energy-efficient design elements, as appropriate.
Policy 2-31.3	Support sustainable building practices that integrate building materials and methods that promote environmental quality, economic vitality, and social benefit through the design, construction, and operation of the built environment.
Goal 2-32	**Conserve energy resources.**
Policy 2-32.1	Require the incorporation of energy conservation features into the design of all new construction and site development activities.
Goal 2-35	**Achieve waste recycling levels that meet or exceed State mandates. Achieve maximum waste recycling in all sectors of the community: residential, commercial, industrial, institutional, and construction.**
Policy 2-35.2	Utilize source reduction, recycling, and other appropriate measures to reduce the amount of solid waste generated in Rialto that is disposed of in landfills.
Goal 2-36	**Reduce air pollution emissions from both mobile and stationary sources in the City.**
Policy 2-36.2	Require that new development projects incorporate design features that encourage ridesharing, transit use, park and ride facilities, and bicycle and pedestrian circulation.
Policy 2-36.3	Establish a balanced land use pattern and facilitate developments that provide jobs for City residents in order to reduce vehicle trips citywide.
Goal 2-39	**Mitigate against climate change.**
Policy 2-39.1	Consult with State agencies, SCAG, and the San Bernardino Associated Governments (SANBAG) to implement AB32 and SB375 by utilizing incentives to facilitate infill and transit-oriented development.
Policy 2-39.3	Provide enhanced bicycling and walking infrastructure, and support public transit, including public bus service, the Metrolink, and the potential for Bus Rapid Transit (BRT).

[9] City of Rialto. 2010, as amended. *The City of Rialto General Plan*. Retrieved from: https://www.rialtoca.gov/DocumentCenter/View/4457/2023-Land-Use-Element?bidId=. Accessed August 13, 2024.

Rialto Airport Specific Plan

The Rialto Airport Specific Plan was adopted by the City in November 1997. The Rialto Municipal Airport ceased operations in 2014 and the former airport property and many of the properties adjacent to the Rialto Municipal Airport that were suited to accommodate development were removed from the Rialto Airport Specific Plan and incorporated into the Renaissance Specific Plan, which was adopted by the City in 2010. Although the Rialto Municipal Airport is no longer operational, the Rialto Airport Specific Plan serves as the zoning ordinance for parcels that were not removed; these parcels are primarily northwest, west, and east of the former Rialto Municipal Airport. The Rialto Airport Specific Plan also provides a framework to guide future land use and development decisions in this area.

City of Rialto Climate Adaptation Plan[10]

The City of Rialto Climate Adaptation Plan outlines goals to reduce energy consumption and GHG emissions to become a more sustainable community. Goals include:

- Prevent truck routes from disproportionately impacting disadvantaged communities;
- Create a clean air checklist for new development of sensitive land uses;
- Increase use of low-emission and electric vehicles where feasible;
- Adopt building and maintenance standards that reflect the regional best practices in reducing urban heat island effect.

4.7.3 Existing Conditions

Certain gases in the earth's atmosphere classified as GHGs play a critical role in determining the earth's surface temperature. Solar radiation enters the earth's atmosphere from space. A portion of the radiation is absorbed by the earth's surface and a smaller portion is reflected toward space. This absorbed radiation is then emitted from the earth as low-frequency infrared radiation. The frequencies at which bodies emit radiation are proportional to temperature. Because the earth has a much lower temperature than the sun, it emits lower-frequency radiation. Most solar radiation passes through GHGs; however, infrared radiation is absorbed by these gases. As a result, radiation that otherwise would have escaped back into space is instead "trapped," resulting in a warming of the atmosphere. This phenomenon, known as the greenhouse effect, is responsible for maintaining a habitable climate on earth.

The primary GHGs contributing to the greenhouse effect are carbon dioxide (CO_2), methane (CH_4), and nitrous oxide (N_2O). Fluorinated gases also make up a small fraction of the GHGs that contribute to climate change. Examples of fluorinated gases include chlorofluorocarbons (CFCs), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), sulfur hexafluoride (SF6), and nitrogen trifluoride (NF_3); however, it is noted that these gases are not associated with typical land use development. Human-caused emissions of GHGs exceeding natural ambient concentrations are believed to be responsible for intensifying the greenhouse effect and leading to a trend of unnatural warming of the Earth's climate, known as global climate change or global warming.

GHGs are global pollutants, unlike criteria air pollutants and toxic air contaminants (TACs), which are pollutants of regional and local concern. Whereas pollutants with localized air quality effects have relatively short atmospheric lifetimes (about one day), GHGs have long atmospheric lifetimes (one to

[10] City of Rialto. 2021. *Climate Adaptation Plan*. Retrieved from: https://www.rialtoca.gov/DocumentCenter/View/2248/Final-Rialto-Climate-Adaptation-Plan. Accessed August 13, 2024.

several thousand years). GHGs persist in the atmosphere for long enough time periods to be dispersed around the globe. Although the exact lifetime of a GHG molecule is dependent on multiple variables and cannot be pinpointed, more CO_2 is emitted into the atmosphere than is sequestered by ocean uptake, vegetation, or other forms of carbon sequestration. Of the total annual human-caused CO_2 emissions, approximately 55 percent is sequestered through ocean and land uptakes every year, averaged over the last 50 years, whereas the remaining 45 percent of human-caused CO_2 emissions remains stored in the atmosphere.[11] **Table 4.7-1: Description of Greenhouse Gases** describes the primary GHGs attributed to global climate change, including their physical properties.

Table 4.7-1: Description of Greenhouse Gases

Greenhouse Gas	Description
Carbon Dioxide (CO_2)	CO_2 is a colorless, odorless gas that is emitted naturally and through human activities. Natural sources include decomposition of dead organic matter; respiration of bacteria, plants, animals, and fungus; evaporation from oceans; and volcanic outgassing. Anthropogenic sources are from burning coal, oil, natural gas, and wood. The largest source of CO_2 emissions globally is the combustion of fossil fuels such as coal, oil, and gas in power plants, automobiles, and industrial facilities. The atmospheric lifetime of CO_2 is variable because it is readily exchanged in the atmosphere. CO_2 is the most widely emitted GHG and is the reference gas (Global Warming Potential of 1) for determining Global Warming Potentials for other GHGs.
Nitrous Oxide (N_2O)	N_2O is largely attributable to agricultural practices and soil management. Primary human-related sources of N_2O include agricultural soil management, sewage treatment, combustion of fossil fuels, and adipic and nitric acid production. N_2O is produced from biological sources in soil and water, particularly microbial action in wet tropical forests. The atmospheric lifetime of N_2O is approximately 120 years. The Global Warming Potential of N_2O is 298.
Methane (CH_4)	CH_4, a highly potent GHG, primarily results from off-gassing (the release of chemicals from nonmetallic substances under ambient or greater pressure conditions) and is largely associated with agricultural practices and landfills. Methane is the major component of natural gas, about 87 percent by volume. Human-related sources include fossil fuel production, animal husbandry, rice cultivation, biomass burning, and waste management. Natural sources of CH_4 include wetlands, gas hydrates, termites, oceans, freshwater bodies, non-wetland soils, and wildfires. The atmospheric lifetime of CH_4 is about 12 years and the Global Warming Potential is 25.
Hydrofluorocarbons (HFCs)	HFCs are typically used as refrigerants for both stationary refrigeration and mobile air conditioning. The use of HFCs for cooling and foam blowing is increasing, as the continued phase out of CFCs and HCFCs gains momentum. The 100-year Global Warming Potential of HFCs range from 124 for HFC-152 to 14,800 for HFC-23.
Perfluorocarbons (PFCs)	PFCs have stable molecular structures and only break down by ultraviolet rays about 60 kilometers above Earth's surface. Because of this, they have long lifetimes, between 10,000 and 50,000 years. Two main sources of PFCs are primary aluminum production and semiconductor manufacturing. Global Warming Potentials range from 6,500 to 9,200.
Chlorofluorocarbons (CFCs)	CFCs are gases formed synthetically by replacing all hydrogen atoms in methane or ethane with chlorine and/or fluorine atoms. They are nontoxic, nonflammable, insoluble, and chemically unreactive in the troposphere (the level of air at the earth's surface). CFCs were synthesized in 1928 for use as refrigerants, aerosol propellants, and cleaning solvents. The Montreal Protocol on Substances that Deplete the Ozone Layer prohibited their production in 1987. Global Warming Potentials for CFCs range from 3,800 to 14,400.
Sulfur Hexafluoride (SF_6)	SF_6 is an inorganic, odorless, colorless, and nontoxic, nonflammable gas. It has a lifetime of 3,200 years. This gas is manmade and used for insulation in electric power transmission equipment, in

[11] Intergovernmental Panel on Climate Change, *Carbon and Other Biogeochemical Cycles. In: Climate Change 2013: The Physical Science Basis*, *Contribution of Working Group I to the Fifth Assessment Report of the Intergovernmental Panel on Climate Change*, 2013. http://www.climatechange2013.org/ images/report/WG1AR5_ALL_FINAL.pdf.

Table 4.7-1: Description of Greenhouse Gases

Greenhouse Gas	Description
	the magnesium industry, in semiconductor manufacturing, and as a tracer gas. The Global Warming Potential of SF_6 is 23,900.
Hydrochlorofluoro-carbons (HCFCs)	HCFCs are solvents, similar in use and chemical composition to CFCs. The main uses of HCFCs are for refrigerant products and air conditioning systems. As part of the Montreal Protocol, HCFCs are subject to a consumption cap and gradual phase out. The United States is scheduled to achieve a 100 percent reduction to the cap by 2030. The 100-year Global Warming Potentials of HCFCs range from 90 for HCFC-123 to 1,800 for HCFC-142b.
Nitrogen Trifluoride (NF_3)	NF_3 was added to Health and Safety Code section 38505(g)(7) as a GHG of concern. This gas is used in electronics manufacturing for semiconductors and liquid crystal displays. It has a high global warming potential of 17,200.

4.7.4 Methodology

Global climate change is, by definition, a cumulative impact of GHG emissions. Therefore, there is no project-level analysis. The baseline against which to compare potential impacts of the Project includes the natural and anthropogenic drivers of global climate change, including world-wide GHG emissions from human activities which almost doubled between 1970 and 2010 from approximately 27 gigatonnes (Gt) of CO_2/year to nearly 49 $GtCO_2$/year.[12] As such, the geographic extent of climate change and GHG emissions cumulative impact discussion is worldwide.

The Project's construction and operational emissions were calculated using the California Emissions Estimator Model version 2022.1 (CalEEMod). For construction, CalEEMod calculates emissions from off-road equipment usage and on-road vehicle travel associated with haul, delivery, and construction worker trips. GHG emissions during construction were forecasted based on the proposed construction schedule and applying the mobile-source and fugitive dust emissions factors derived from CalEEMod. The Project's construction-related GHG emissions would be generated from off-road construction equipment, on-road hauling and vendor (material delivery) trucks, and worker vehicles. The Project's construction is anticipated to occur over a duration of approximately 15 months, beginning in 2025.

The Project's operational GHG emissions would be generated by vehicular traffic including passenger automobiles and trucks, off-road equipment, area sources (e.g., landscaping maintenance, consumer products), electrical generation, water supply and wastewater treatment, and solid waste. These emissions categories are discussed further in **Appendix B**.

4.7.5 Thresholds of Significance

The following significance criteria for GHG impacts were derived from the Environmental Checklist in CEQA Guidelines Appendix G. The proposed Project would result in a significant impact related to GHG if it would:

- Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment; or

[12] Intergovernmental Panel on Climate Change, *Climate Change 2014 Mitigation of Climate Change Working Group III Contribution to the Fifth Assessment Report of the Intergovernmental Panel on Climate Change*, 2014.

- Conflict with any applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

Addressing GHG emissions generation impacts requires an agency to determine what constitutes a significant impact. The amendments to the CEQA Guidelines specifically allow lead agencies to determine thresholds of significance that illustrate the extent of an impact and are a basis from which to apply mitigation measures. This means that each agency is left to determine whether a project's GHG emissions will have a "significant" impact on the environment. The guidelines direct that agencies are to use "careful judgment" and "make a good-faith effort, based to the extent possible on scientific and factual data, to describe, calculate or estimate" a project's GHG emissions.[13]

GHG Thresholds

On December 5, 2008, the SCAQMD Governing Board adopted a 10,000 $MTCO_2e$ industrial threshold for projects where the SCAQMD is lead agency. During the GHG CEQA Significance Threshold Working Group Meeting #15, the SCAQMD noted that it was considering extending the industrial GHG significance threshold for use by all lead agencies. This Working Group was formed to assist SCAQMD's efforts to develop a GHG significance threshold and is composed of a wide variety of stakeholders including the State Office of Planning and Research, CARB, the Attorney General's Office, a variety of city and county planning departments in the SCAB, various utilities such as sanitation and power companies throughout the SCAB, industry groups, and environmental and professional organizations. However, the SCAQMD has not announced when staff is expecting to present GHG thresholds for land use projects where the SCAQMD is not the lead agency to the governing board. During Meeting #8, the Working Group defined industrial uses as production, manufacturing, and fabrication activities or storage and distribution (e.g., warehouse, transfer facility, etc.). Additionally, the SCAQMD GHG Significance Threshold Stakeholder Working Group has specified that a warehouse is considered to be an industrial project.[14] Further, the Working Group indicated that the 10,000 $MTCO_2e$ per year threshold applies to both emissions from construction and operational phases plus indirect emissions (electricity, water use, etc.).

Although the screening threshold for industrial projects is 10,000 $MTCO_2e$ per year, this analysis conservatively uses 3,000 $MTCO_2e$ per year as the Project GHG threshold.

4.7.6 Project Impacts and Mitigation

Threshold 4.7-1:	**Would the Project generate GHG emissions, either directly or indirectly, that could have a significant impact on the environment?**
	Level of Significance: Significant and Unavoidable Impact. Emissions would be reduced but would remain significant and unavoidable with the incorporation of MM AQ-2 through MM AQ-5 and MM GHG-1 through MM GHG-4.

Short-Term Construction Greenhouse Gas Emissions

The Project would result in direct emissions of CO_2, N_2O, and CH_4 from construction equipment and the transport of materials and construction workers to and from the project site. The GHG emissions only occur during temporary construction activities and would cease once construction is complete. The total

[13] 14 California Code of Regulations, Section 15064.4a

[14] South Coast Air Quality Management District, *Minutes for the GHG CEQA Significance Threshold Stakeholder Working Group #8*, 2009.

GHG emissions generated during the construction of the Project are shown in **Table 4.7-2: Construction-Related Greenhouse Gas Emissions**.

Table 4.7-2: Construction-Related Greenhouse Gas Emissions

Category	$MTCO_2e$
Construction Year 1	480
Construction Year 2	835
Total Construction Emissions	1,315
30-Year Amortized Construction Emissions	**44**

Source: CalEEMod version 2022.1. Refer to **Appendix B** for model outputs.

As shown, the Project would result in the generation of approximately 1,315 $MTCO_2e$ throughout the course of construction. Construction GHG emissions are typically summed and amortized over a 30-year period and then added to the operational emissions.[15] The Project's amortized construction emissions would be 44 $MTCO_2e$ per year. Once construction is complete, the generation of these GHG emissions would cease.

It is also noted that in response to the increase in warehouse development in California, the State of California Department of Justice issued a memorandum in March 2021, entitled *Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act* (Memorandum). The Memorandum encourages warehouse projects to implement certain best practices, one of which is that construction equipment not in use for more than three minutes be turned off.

Long-Term Operational Greenhouse Gas Emissions

Operational or long-term emissions occur over the life of the Project. GHG emissions would result from direct emissions such as project-generated vehicular traffic including passenger automobiles and trucks, and operation of any landscaping equipment. Operational GHG emissions would also result from indirect sources, such as off-site generation of electrical power, the energy required to convey water to, and wastewater from the Project, the emissions associated with solid waste generated from the Project, and any fugitive refrigerants from air conditioning or refrigerators. GHG emissions associated with the Project are summarized in **Table 4.7-3: Project Greenhouse Gas Emissions**.

Table 4.7-3 shows that the Project's unmitigated emissions would be approximately 11,596 $MTCO_2e$ annually from operations with amortized construction. Therefore, project-related GHG emissions would exceed the 3,000 $MTCO_2e$ per year threshold. It should be noted that the majority of the unmitigated GHG emissions (82%) are associated with non-construction related mobile sources. Emissions of motor vehicles are controlled by State and federal standards, and neither the Project Applicant nor the City has control over these standards.

[15] The amortization period of 30 years is based on the standard assumption of the South Coast Air Quality Management District (South Coast Air Quality Management District, *Minutes for the GHG CEQA Significance Threshold Stakeholder Working Group #13,* August 26, 2009).

Table 4.7-3: Project Greenhouse Gas Emissions

Emissions Source	$MTCO_2e$ per Year	
	Unmitigated	Mitigated
Area and Indirect Sources		
Construction Amortized Over 30 Years	44	44
Area Source[1]	14	0
Energy – Electricity[2]	229	5
Energy – Natural Gas[3]	674	0
Off-road – Yard Trucks[4]	111	35
Off-Road – Forklifts[4]	354	112
Emergency Backup Generator	8	8
Waste[5]	196	49
Water and Wastewater[6]	467	421
Mobile Sources		
Trucks	8,029	8,029
Passenger Cars[7]	1,469	1,469
Total	***11,596***	***10,172***
Threshold	*3,000*	*3,000*
Exceeds Threshold?	**Yes**	**Yes**

1. Mitigation Measure (MM) AQ-3 requires 100 percent electric landscaping equipment, which would reduce area source emissions.
2. MM GHG-1 requires renewable energy to offset energy emissions and MM GHG-2 requires buildings to meet or exceed CALGreen Tier 2 standards.
3. MM AQ-2 requires the Project to use all-electric appliances, and end uses instead of natural gas, as well as prohibits installation of natural gas utility lines or connections (refer to **Section 4.2: Air Quality**).
4. MM AQ-5 requires outdoor cargo handling equipment to be zero emissions or alternatively fueled (refer to **Section 4.2: Air Quality**).
5. MM GHG-3 requires the Project to divert 75 percent of waste from landfills.
6. MM GHG-4 requires to implement a Water Use Efficiency and Conservation Plan.
7. MM AQ-4 requires the implementation of a Transportation Demand Management (TDM) program to reduce single-occupant vehicle trips and encourage public transit (refer to **Section 4.2: Air Quality**). However, emission reductions associated with MM AQ-4 were conservatively not included in this table.

Source: CalEEMod version 2022.1. Refer to **Appendix B** for model outputs.

Section 4.2: Air Quality discusses numerous mitigation measures (MM) that would also reduce GHG emissions. For example, MM AQ-2 through MM AQ-5 have been identified to reduce operational emissions. MM AQ-2 requires the Project to use all-electric appliances, and end uses instead of natural gas, as well as prohibits installation of natural gas utility lines or connections. MM AQ-3 requires landscape equipment to be 100 percent electric. MM AQ-4 requires the implementation of a Transportation Demand Management (TDM) program to reduce single-occupant vehicle trips and encourage public transit. MM AQ-5 requires outdoor cargo handling equipment to be zero emissions or alternatively fueled.

Further, the Project would implement MMs GHG-1 through GHG-4. MM GHG-1 requires renewable energy to offset energy emissions. MM GHG-2 requires the Project to meet or exceed CALGreen Tier 2 standards to further improve energy efficiency. MM GHG-3 requires the Project to divert 75 percent of waste from landfills. MM GHG-4 requires the Project to implement a Water Use Efficiency and Conservation Plan.

Table 4.7-3 shows that implementation of these mitigation measures would reduce GHG emissions to 10,172 $MTCO_2e$. As previously noted, the majority of the Project's GHG emissions are generated by mobile emissions. The TDM program required by MM AQ-4 would reduce GHG emissions from commuting.

Additional mitigation to reduce the Project's mobile emissions is not feasible due to the limited ability of the City to address emissions resulting from mobile sources and/or emissions generated by cars and trucks outside of the City's jurisdictional limits. As with all land use projects, the Project's mobile and transportation related GHG emissions are a function of two parameters: emissions control technology and vehicle miles traveled (VMT).

CARB is directly responsible for regulating mobile and transportation source emissions in the State. Regarding the first parameter, California addresses emissions control technology through a variety of legislation and regulatory schemes, including the State's Low Carbon Fuel Standard (Executive Order S-01-07) (LCFS), a regulatory program designed to encourage the use of cleaner low-carbon transportation fuels in California, encourage the production of those fuels, and therefore, reduce GHG emissions and decrease petroleum dependence in the transportation sector. The regulatory standards are expressed in terms of the "carbon intensity" of gasoline and diesel fuel and their substitutes. Different types of fuels are evaluated to determine their "life cycle emissions" which include the emissions associated with producing, transporting, and using the fuels. Each fuel is then given a carbon intensity score and compared against a declining carbon intensity benchmark for each year. Providers of transportation fuels must demonstrate that the mix of fuels they supply for use in California meets these declining benchmarks for each annual compliance period.

In 2018, CARB approved amendments to the LCFS, which strengthened the carbon intensity benchmarks through 2030 to ensure they are in-line with California's 2030 GHG emission reduction target enacted through SB 32. CARB is also implementing additional transportation sector regulations such as Advanced Clean Cars II, Advanced Clean Trucks, and Advanced Clean Fleets.[16] This ensures that the transportation sector is meeting its obligations to achieve California's GHG reduction targets. The Project would be required to comply with these regulations through vehicle manufacturer compliance. The State is also implementing legislation and regulations to address the second parameter affecting transportation related GHG emissions by controlling for VMT. Examples of this include SB 375, which links land use and transportation funding and provides one incentive for regions to achieve reductions in VMT, and SB 743, which discourages VMT increases for passenger car trips above a region-specific benchmark.

Additional mitigation to further reduce the Project's non-mobile emissions would be speculative. The Project's mitigation measures address non-mobile emissions to the extent possible, by designing the warehouse building to provide environmental design features, incorporating energy and water conservation measures, and providing electrical, heating, ventilation, lighting, and power systems that meet or exceed CALGreen Standards. The State is addressing the remaining energy-related GHG emissions through SB 100 and SB 1020, which require 100 percent clean electricity retail sales by 2045. Additionally, SB 905 requires the State to use carbon removal, carbon capture, utilization, and sequestration technologies and AB 1757 requires nature-based sequestration in natural working lands.

It should be noted that the Project would be required to comply with SCAQMD Rule 2305 which would directly reduce emissions or to otherwise facilitate emissions reductions. Alternatively, warehouse operators can choose to pay a mitigation fee. Funds from the mitigation fee will be used to incentivize the purchase of cleaner trucks and charging/fueling infrastructure in communities nearby. Although Rule 2305

[16] On January 13, 2025, California withdrew its request for federal approval of the Advanced Clean Fleets and is evaluating next steps. CARB will not enforce portions of the regulation requiring federal authorization, such as those affecting high-priority and drayage fleets. However, State and local government fleet requirements remain unchanged. (Source: California Air Resources Board, *ACF Waiver Update*, Retrieved from: https://ww2.arb.ca.gov/our-work/programs/advanced-clean-fleets. Accessed February 2025.)

focuses on air quality pollutant emissions, the rule would facilitate cleaner vehicles and supporting infrastructure that would also result in GHG benefits.

Warehouse owners and operators are required to earn WAIRE Points each year. WAIRE points are a menu-based system earned by emission reduction measures. Warehouse operators are required to submit an annual WAIRE Report which includes truck trip data and emission reduction measures. WAIRE points can be earned by completing actions from a menu that can include acquiring and using natural gas, Near-Zero Emissions and/or Zero-Emissions on-road trucks, zero-emission cargo handling equipment, solar panels or zero-emission charging and fueling infrastructure, or other options. Conservatively, this analysis and the GHG emissions results presented in **Table 4.7-3** do not take credit for these potential reductions. Compliance with Rule 2305 would likely reduce emissions below what is currently analyzed.

As shown in **Table 4.7-3**, mitigated GHG emissions would exceed the 3,000 $MTCO_2e$ per year threshold despite implementation of all feasible mitigation. Therefore, project-related GHG emissions would be significant and unavoidable.

Threshold 4.7-2:	**Would the Project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?**
	Level of Significance: Less than Significant with the incorporation of MM AQ-2 through MM AQ-5 and MM GHG-1 through MM GHG-4.

City of Rialto Climate Adaptation Plan Consistency

The Rialto Climate Adaptation Plan outlines goals to reduce energy consumption and GHG emissions to become a more sustainable community. The proposed Project would be required to comply with all building codes in effect at the time of construction which include energy conservation measures mandated by Title 24 of the California Building Standards Code – Energy Efficiency Standards and the California Green Building Standards. Because Title 24 standards require energy conservation features in new construction (e.g., high-efficiency lighting, high-efficiency heating, ventilating, and air-conditioning [HVAC] systems, thermal insulation, double-glazed windows, water-conserving plumbing fixtures), these standards indirectly regulate and reduce GHG emissions. California's Building Energy Efficiency Standards are updated on an approximately three-year cycle. The most recent 2022 standards went into effect January 1, 2023.

Further, the Project would comply with the City's General Plan policies and State Building Code provisions designed to reduce GHG emissions. The proposed Project would also comply with all SCAQMD applicable rules and regulations during construction and operation and would not interfere with the State's AB 32 goals.

Consistency with SCAG RTP/SCS (Connect SoCal)

On April 4, 2024, SCAG's Regional Council adopted the *2024 - 2050 Regional Transportation Plan/ Sustainable Communities Strategy* (RTP/SCS) or Connect SoCal. The RTP/SCS is a long-range visioning plan that balances future mobility and housing needs with economic, environmental, and public health goals. The RTP/SCS embodies a collective vision for the region's future and is developed with input from local governments, county transportation commissions, tribal governments, nonprofit organizations, businesses, and local stakeholders in the counties of Imperial, Los Angeles, Orange, Riverside, San

Bernardino, and Ventura. Under SB 375, SCAG's RTP/SCS establishes GHG emissions goals to reduce GHG emissions in the region by eight percent from 2005 levels by 2020 and 19 percent by 2035.[17]

Implementation of the RTP/SCS would add 181,200 new miles of transit revenue service, 4,000 new miles of bike lanes and 869 new miles to the Regional Express Lane Network. Strategic investments in infrastructure and transportation would improve access to employment centers and stimulate regional economic growth and opportunity in historically underserved areas. Connect SoCal is an important planning document for the region, allowing public agencies to implement transportation projects in a coordinated manner while qualifying for federal and State funding. Connect SoCal also supports local jurisdictions in making informed land use planning and housing development decisions.

The RTP/SCS plans account for operations and maintenance costs to ensure reliability, longevity, and cost effectiveness. The RTP/SCS are also supported by a combination of transportation and land use strategies that help the region achieve state GHG emissions reduction goals and FCAA requirements, increased housing production, improved equity and resilience, the preservation of natural lands, improvement of public health, increased transportation safety, support for the region's vital goods movement industries and more efficient use of resources. GHG emissions resulting from development-related mobile sources are the most potent source of emissions, and therefore project comparison to the RTP/SCS is an appropriate indicator of whether the project would inhibit the post-2020 GHG reduction goals promulgated by the state. The Project's consistency with the Connect SoCal goals is provided in **Table 4.7-4: Connect SoCal Consistency**.

Compliance with applicable State standards would ensure consistency with State and regional GHG reduction planning efforts. The goals stated in the RTP/SCS were used to determine consistency with the planning efforts previously stated. As shown in **Table 4.7-4**, the Project would be consistent with the stated goals of the RTP/SCS. Therefore, the Project would not result in any significant impacts or interfere with SCAG's ability to achieve the region's GHG emission reduction target of 19 percent by the year 2035 or the post-2020 mobile source GHG reduction targets.

[17] California Air Resources Board, *SB 375 Regional Targets*, https://ww2.arb.ca.gov/our-work/programs/sustainable-communities-program/sb-375-regional-targets, accessed August 2025.

Table 4.7-4: Connect SoCal Consistency	
SCAG Goals	**Compliance**
Mobility: Build and maintain an integrated multimodal transportation network.	
Support investments that are well-maintained and operated, coordinated, resilient and result in improved safety, improved air quality and minimized greenhouse gas emissions	**N/A**. This is not a project-specific policy and is therefore not applicable.
Ensure that reliable, accessible, affordable, and appealing travel options are readily available, while striving to enhance equity in the offerings in high-need communities	**N/A**. This is not a project-specific policy and is therefore not applicable.
Support planning for people of all ages, abilities, and backgrounds	**N/A**. This is not a project-specific policy and is therefore not applicable.
Communities: Develop, connect, and sustain communities that are livable and thriving	
Create human-centered communities in urban, suburban, and rural settings to increase mobility options and reduce travel distances	**Consistent**. The project site is located in an urban area in proximity to existing community services. Additionally, the site is located near existing transit routes (i.e., OmniTrans route along Locust Avenue) and access to Interstate 210 (I-210).
Produce and preserve diverse housing types in an effort to improve affordability, accessibility, and opportunities for all households	**N/A**. The Project does not propose residential uses.
Environment: Create a healthy region for the people of today and tomorrow	
Develop communities that are resilient and can mitigate, adapt to, and respond to chronic and acute stresses and disruptions, such as climate change	**Consistent**. As discussed in **Section 4.2: Air Quality**, the Project would not exceed SCAQMD's regional or localized thresholds. Based on the Friant Ranch decision, projects that do not exceed the SCAQMD's localized significance thresholds (LSTs) would not violate any air quality standards or contribute substantially to an existing or projected air quality violation and result in no criteria pollutant health impacts. Additionally, the Project's Health Risk Assessment determined potential health risks associated with Toxic Air Contaminants resulting from implementation of the proposed Project would be less than significant. As discussed under Impact 4.7-1 in this section of the EIR, the Project would require all feasible mitigation to reduce GHG emissions. In addition to MM AQ-2 through MM AQ-5, discussed further in **Section 4.2: Air Quality**, the Project would implement MM GHG-1 through MM GHG-4. MM GHG-1 requires the renewable energy to offset energy emissions. MM GHG-2 requires the Project to meet or exceed CALGreen Tier 2 standards to further improve energy efficiency. MM GHG-3 requires the Project to divert 75 percent of waste from landfills. MM GHG-4 requires to implement a Water Use Efficiency and Conservation Plan. Therefore, the Project would not result in health impacts and would implement all feasible mitigation to reduce GHG emissions.
Integrate the region's development pattern and transportation network to improve air quality,	**Consistent**. While the Project is not a transportation improvement Project, the project site is located in a developed area and would reduce truck trip lengths, which

Table 4.7-4: Connect SoCal Consistency	
SCAG Goals	**Compliance**
reduce greenhouse gas emissions and enable more sustainable use of energy and water	would reduce GHG and air quality emissions. Additionally, the reduction of energy use, improvement of air quality, and promotion of more environmentally sustainable development are encouraged through the development of alternative transportation methods, green design techniques for buildings, and other energy-reducing techniques such as compliance with the provisions of the California Building Energy Efficiency Standards and the Green Building Standards Code (CALGreen).
Conserve the region's resources	**Consistent**. The project site is vacant and is not designated for agricultural uses, natural resources, or conservation. Therefore, Project development would not result in a loss of the region's resources.
Economy: Support a sustainable, efficient, and productive regional economic environment that provides opportunities for all people in the region	
Improve access to jobs and educational resources	**Consistent**. The Project proposes a warehouse development within an urban area with residential, retail, and institutional land uses. The Project could provide approximately 557 jobs[18], which would improve access to jobs opportunities.
Advance a resilient and efficient goods movement system that supports the economic vitality of the region, attainment of clean air and quality of life for our communities	**Consistent**. The Project includes a warehouse use that would support goods movement. As summarized above, the Project would result in less than significant air quality and health risk impacts.

Consistency with the 2022 CARB Scoping Plan

As previously noted, the 2022 Scoping Plan sets a path to achieve targets for carbon neutrality and reduce anthropogenic GHG emissions by 85 percent below 1990 levels by 2045 in accordance with AB 1279. The transportation, electricity, and industrial sectors are the largest GHG contributors in the State. The 2022 Scoping Plan plans to achieve the AB 1279 targets primarily through zero-emission transportation (e.g., electrifying cars, buses, trains, and trucks). Additional GHG reductions are achieved through decarbonizing the electricity and industrial sectors.

Statewide strategies to reduce GHG emissions in the latest 2022 Scoping Plan include implementing SB 100, which would achieve 100 percent clean electricity by 2045; achieving 100 percent zero emission vehicle sales in 2035 through Advanced Clean Cars II; and implementing the Advanced Clean Fleets[19] regulation to deploy zero-electric vehicle buses and trucks. Additional transportation policies include the Off-Road Zero-Emission Targeted Manufacturer rule, Clean Off-Road Fleet Recognition Program, In-use Off-Road Diesel-Fueled Fleets Regulation, Off-Road Zero-Emission Targeted Manufacturer rule, Clean Off-

[18] Based on employee generation factor of 1 per 1,195 sf of warehouse use provided by Natelson Company, Inc's *Employment Density Study Summary Report Prepared for SCAG* (2001).

[19] On January 13, 2025, California withdrew its request for federal approval of the Advanced Clean Fleets and is evaluating next steps. CARB will not enforce portions of the regulation requiring federal authorization, such as those affecting high-priority and drayage fleets. However, State and local government fleet requirements remain unchanged. Source: California Air Resources Board, *ACF Waiver Update*, Retrieved from: https://ww2.arb.ca.gov/our-work/programs/advanced-clean-fleets. Accessed February 2025.

Road Fleet Recognition Program, and Amendments to the In-use Off-Road Diesel-Fueled Fleets Regulation. The 2022 Scoping Plan would continue to implement SB 375. GHGs would be further reduced through the Cap-and-Trade Program carbon pricing and SB 905. SB 905 requires CARB to create the Carbon Capture, Removal, Utilization, and Storage Program to evaluate, demonstrate, and regulate carbon dioxide removal projects and technology.

As indicated in **Table 4.7-3,** approximately 93 percent of the Project's mitigated GHG emissions are from mobile sources which would be further reduced by the 2022 Scoping Plan measures described above. It should be noted that the City has no control over vehicle emission standards. However, these emissions would decline in the future due to Statewide measures discussed above, as well as cleaner technology and fleet turnover. Several of the State's plans and policies would contribute to a reduction in mobile source emissions from the Project. These include the following:

CARB's Advanced Clean Truck Regulation: Adopted in June 2020, CARB's Advanced Clean Truck Regulation requires truck manufacturers to transition from diesel trucks and vans to electric zero-emission trucks beginning in 2024. By 2045, every new truck sold in California is required to be zero-emission. The Advanced Clean Truck Regulation accelerates the transition of zero-emission medium-and heavy-duty vehicles from Class 2b to Class 8.

- **Executive Order N-79-20**: Executive Order N-79-20 establishes the goal for all new passenger cars and trucks, as well as all drayage/cargo trucks and off-road vehicles and equipment, sold in California, will be zero-emission by 2035 and all medium and heavy-duty vehicles will be zero-emission by 2045. It also directs CARB to develop and propose rulemaking for passenger vehicles and trucks, medium-and heavy-duty fleets where feasible, drayage trucks, and off-road vehicles and equipment "requiring increasing volumes" of new ZEVs "towards the target of 100 percent."
- **CARB's Mobile Source Strategy**: CARB's Mobile Source Strategy takes an integrated planning approach to identify the level of transition to cleaner mobile source technologies needed to achieve all of California's targets by increasing the adoption of ZEV buses and trucks.
- **CARB's Sustainable Freight Action Plan**: The Sustainable Freight Action Plan which improves freight system efficiency, utilizes near-zero emissions technology, and deployment of ZEV trucks. This Plan applies to all trucks accessing the Project site and may include existing trucks or new trucks that are part of the statewide goods movement sector.
- **CARB's Emissions Reduction Plan for Ports and Goods Movement**: CARB's Emissions Reduction Plan for Ports and Goods Movement identifies measures to improve goods movement efficiencies such as advanced combustion strategies, friction reduction, waste heat recovery, and electrification of accessories.

While these measures are not directly applicable to the Project, any commercial activity associated with goods movement would be required to comply with these measures as adopted. The Project would not obstruct or interfere with efforts to increase ZEVs or state efforts to improve system efficiency, nor conflict with the State's progress towards carbon neutrality under the 2022 Scoping Plan. The Project would also not convert any Natural and Working Lands and/or decrease the urban forest carbon stock in the State, which are areas of emphasis in the 2022 Scoping Plan.

In conclusion, the Project does not conflict with the applicable plans that are discussed above. Therefore, impacts would be less than significant with implementation of MM GHG-1 through MM GHG-4 and MM AQ-2 through MM AQ-5 (refer to **Section 4.2: Air Quality**).

4.7.7 Cumulative Impacts

Climate change is a global problem. GHGs are global pollutants, unlike criteria air pollutants and TACs, which are pollutants of regional and local concern. Whereas pollutants with localized air quality effects have relatively short atmospheric lifetimes (about one day), GHGs have much longer atmospheric lifetimes of one year to several thousand years that allow them to be dispersed around the globe.

It is generally the case that an individual project of this size and nature is of insufficient magnitude by itself to influence climate change or result in a substantial contribution to the global GHG inventory. GHG impacts are recognized as exclusively cumulative impacts; there are no non-cumulative GHG emission impacts from a climate change perspective. As discussed above, the Project-related GHG emissions would exceed the 3,000 $MTCO_2e$ threshold of significance despite implementation of MM GHG-1 through MM GHG-4 and MM AQ-2 through MM AQ-5 (refer to **Section 4.2: Air Quality**)**.** As such, the Project cumulatively contribute to a significant and unavoidable GHG impact.

4.7.8 Mitigation Program

Laws, Ordinances, and Regulations

Laws, Ordinances, and Regulations (LORs) are existing requirements that are based on local, State, or federal regulations or laws that are frequently required independently of CEQA review. Typical LORs include compliance with the provisions of the Building Code, SCAQMD Rules, etc. The City may impose additional conditions during the approval process, as appropriate. Because LORs are neither Project specific nor a result of development of the Project, they are not considered to be either Project Design Features or Mitigation Measures. However, they are included in the Mitigation Program to comprehensively identify Project requirements.

Please refer to LOR AQ-2 and LOR AQ-3 in **Section 4.2: Air Quality**, which requires diesel-powered construction equipment to be turned off when not in use and the installation of water efficient irrigation systems and devices, respectively.

LOR GHG-1 Limit idling time for commercial vehicles to no more than five minutes per Title 13 of the California Code of Regulations, Section 2485.

LOR GHG-2 In accordance with California Title 24 Standards, buildings will be designed to have 15 percent of the roof area “solar ready” that will structurally accommodate later installation of rooftop solar panels. If future building operators pursue providing rooftop solar panels, they will submit plans for solar panels prior to occupancy.

LOR GHG-3 Install water-efficient irrigation systems and devices, such as soil moisture-based irrigation controls and sensors for landscaping, according to the City’s Water Efficient Landscape requirements (Chapter 12.50 of the City’s Municipal Code).

LOR GHG-4 Design buildings to be water-efficient. Install water-efficient fixtures in accordance with Section 5.303 of the California Green Building Standards Code Part 11.

LOR GHG-5 Recycle and/or salvage for reuse a minimum of 65 percent of the nonhazardous construction and demolition waste in accordance with Section 5.408.1 of the California Green Building Standards Code Part 11.

LOR GHG-6 Provide storage areas for recyclables and green waste and adequate recycling containers located in readily accessible areas in accordance with Section 5.410 of the California Green Building Standards Code Part 11.

LOR GHG-7 To facilitate future installation of electric vehicle supply equipment (EVSE), construction shall comply with Section 5.106.5.3 (nonresidential electric vehicle charging) of the California Green Building Standards Code Part 11.

Mitigation Measures

MMs AQ-2 through AQ-5 and the following measures are applicable to the Project.

MM GHG-1 **On-Site Renewable Electricity Generation.** Prior to the issuance of the final Certificate of Occupancy for the building tenant, documentation shall be provided to the City demonstrating that the Project has either: 1) installed solar photovoltaic (PV) panels or other source of renewable energy generation on the site, or 2) otherwise acquired energy from the local utility that has been generated by renewable sources, such that either option will provide 100 percent of the expected building load which is anticipated to be approximately 1.42 kilowatt hours per year [kWh/year] per square foot). Alternatively, the Project may achieve 100 percent of the building's expected energy load through a combination of on-site renewable energy generation and renewable energy purchase.

The final PV generation facility size requires approval by Southern California Edison (SCE). Should SCE limit the facility size, the amounts above shall be limited to the amount of SCE's approval. This mitigation measure applies only to tenant improvements and not the building shell approvals.

MM GHG-2 **CALGreen Tier 2.** Prior to the issuance of a building permit, the Project Applicant or successor in interest shall provide documentation to the City of Rialto Community Development Department, Building and Safety Division demonstrating that the Project is designed to meet or exceed 2022 CALGreen Tier 2 standards in effect at the time of building permit application.

MM GHG-3 **Solid Waste Diversion.** Prior to issuance of tenant occupancy permits, the Project operator shall designate a solid waste management coordinator and implement a waste management plan to recycle and/or salvage nonhazardous debris to achieve a minimum 75 percent diversion from landfills. The City of Rialto Community Development Department, Planning Division shall confirm that sales or lease agreements includes contractual language that obligates tenants, operators, or future owners to comply with the solid waste management plan. This mitigation measure applies only to tenant permits and not the building shell approvals.

MM GHG-4 **Water Use Efficiency and Conservation Plan.** The Project Applicant or designee shall implement a Water Use Efficiency and Conservation Plan that includes the following minimum requirements:

Indoor Conservation Features and Operations*:*

- **Install low-flow Fixtures**: Install low-flow toilets at 1.28 gallons per flush, faucets at 1.2 gallons per minute, showerheads at 1.8 gallons per minute, kitchen faucets at 1.8

gallons per minute. In common areas, install faucets at 0.5 gallon per minute and urinals at max of 0.25 gallon per minute/flush. (These fixtures use less water while maintaining efficient performance.)

- Install dual-flush toilets: These toilets offer two flush options: one for liquid waste less than 1 gallon per minute and another for solid waste at 1.28 gallons per minute. (This allows the appropriate use of water for flushing needs.)
- Use water-efficient appliances: The Project Applicant or designee shall install energy-efficient and water-saving appliances with the ENERGY STAR label only.
- Good housekeeping and regular maintenance: The Project Applicant or designee shall regularly check and maintain plumbing fixtures, irrigation systems, and appliances to ensure they are functioning efficiently and not wasting water.

Outdoor Conservation Features and Operations:

- **Install only "Smart Irrigation Systems" for community landscaping**: The Project Applicant or designee shall use smart sprinkler systems that adjust watering schedules based on weather conditions, soil moisture, and plant needs to avoid over or wasteful watering. The Project Applicant or designee shall also incorporate seasonal specific controls to ensure watering occurs during the most efficient times of day.
- **Adjustable Water Pressure Regulator**: The Project Applicant or designee shall install pressure regulators to maintain optimal water pressure, preventing overuse and leaks.
- **Drought-tolerant landscaping**: The Project Applicant or designee shall include native and drought-tolerant vegetation that requires less water to thrive and is known to survive in the City of Rialto. The Project Applicant or designee shall replace drought-tolerant landscaping if it dies through enforceable Project CC&Rs and/or tenant lease agreements.

4.7.9 Level of Significance After Mitigation

Project implementation would result in significant unavoidable GHG emissions. No additional feasible mitigation measures are available that can reduce impacts to a less than significant level.

4.8 HAZARDS AND HAZARDOUS MATERIALS

4.8.1 Introduction

This section of the EIR describes the potential hazards (other than geologic, flood, and wildfire hazards) associated with the project site, infrastructure, activities, and materials that could impact human health and the environment. The analysis in this section is based on the Phase I Environmental Site Assessment (ESA) and Phase II ESA prepared by Hazard Management Consulting, Inc. dated July 2023, which are included respectively as **Appendix G1 and Appendix G2** of this EIR.

4.8.2 Regulatory Setting

Federal Regulations

Disaster Mitigation Act of 2000

The Disaster Mitigation Act of 2000 is a United States federal law that aims to reduce the impact of disasters on communities and promote preparedness. It focuses on several key areas, including hazard mitigation planning, grants for mitigation projects, and the establishment of a National Mitigation Framework. The act encourages local communities to develop and implement hazard mitigation plans to identify and reduce risks. It also provides funding for projects that aim to mitigate the effects of disasters, such as flood control measures or building retrofits. Additionally, the act establishes the National Mitigation Framework, which serves as a guide for federal agencies and stakeholders to coordinate and collaborate on mitigation efforts.

Federal Emergency Management Act

The Federal Emergency Management Act establishes and outlines the responsibilities and authorities of the Federal Emergency Management Agency (FEMA). The act aims to coordinate and support the nation's preparedness, response, recovery, and mitigation efforts for all types of disasters, including natural disasters and emergencies caused by terrorism. FEMA is tasked with providing assistance and resources to state, local, tribal, and territorial governments, as well as to individuals and communities affected by disasters. The act also authorizes FEMA to administer various programs, such as the National Flood Insurance Program and the Hazard Mitigation Assistance Program, which provide funding and support for disaster preparedness and mitigation initiatives. Additionally, the act establishes the National Incident Management Assistance Teams to assist with coordination during large-scale incidents and authorizes the president to declare a major disaster or emergency, enabling the release of federal resources and assistance to affected areas.

Toxic Substances Control Act/Resource Conservation and Recovery Act/Hazardous and Solid Waste Act

The federal Toxic Substances Control Act of 1976 and Resource Conservation and Recovery Act (RCRA) established a program administered by the U.S. Environmental Protection Agency (U.S. EPA) for the regulation of the generation, transportation, treatment, storage, and disposal of hazardous waste. RCRA was amended in 1984 by the Hazardous and Solid Waste Act, which affirmed and extended the “cradle to grave” system of regulating hazardous wastes.

Underground Storage Tanks (USTs) are regulated under Subtitle I of RCRA and its regulations, which established construction standards for UST installations installed after December 22, 1988, as well as

standards for upgrading existing USTs and associated piping. Since 1998, all non-conforming tanks were required to be either upgraded or closed.

Comprehensive Environmental Response, Compensation, and Liability Act/Superfund Amendments and Reauthorization Act

The Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), commonly known as Superfund, was enacted by Congress on December 11, 1980. This law (U.S. Code Title 42, Chapter 103) provides broad federal authority to respond directly to releases or threatened releases of hazardous substances that may endanger public health or the environment. CERCLA establishes requirements concerning closed and abandoned hazardous waste sites; provides for liability of persons responsible for releases of hazardous waste at these sites; and establishes a trust fund to provide for cleanup when no responsible party can be identified. CERCLA also enables the revision of the National Contingency Plan (NCP). The NCP (Title 40, Code of Federal Regulation [CFR], Part 300) provides the guidelines and procedures needed to respond to releases and threatened releases of hazardous substances, pollutants, and/or contaminants. The NCP also established the National Priorities List. CERCLA was amended by the Superfund Amendments and Reauthorization Act on October 17, 1986.

Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) and the National Priorities List

The U.S. EPA also maintains the Comprehensive Environmental Response Compensation (CERCLIS) and Liability Information System list. This list contains sites that are either proposed to be or on the National Priorities List (NPL), as well as sites that are in the screening and assessment phase for possible inclusion on the NPL. The NPL is a list of the worst hazardous waste sites that have been identified by Superfund. There are no NPL sites on the project site.

Emergency Planning and Community Right-to-Know Act

The federal Emergency Planning and Community Right-To-Know Act (EPCRA) was enacted to inform communities and residents of chemical hazards in their area. Businesses are required to report the locations and quantities of chemicals stored on-site to both State and local agencies. EPCRA requires the U.S. EPA to maintain and publish a digital database list of toxic chemical releases and other waste management activities reported by certain industry groups and federal facilities. This database, known as the Toxic Release Inventory, gives the community more power to hold companies accountable for their chemical management.

Hazardous Materials Transportation Act

The U.S. Department of Transportation (DOT) receives authority to regulate the transportation of hazardous materials from the Hazardous Materials Transportation Act (HMTA), as amended and codified (49 U.S.C. § 5101 et seq.). The DOT is the primary regulatory authority for the interstate transport of hazardous materials and establishes regulations for safe handling procedures (i.e., packaging, marking, labeling and routing).

The Pipeline and Hazardous Material Safety Administration was delegated the responsibility to prepare the hazardous material regulations, which are contained in Title 49 of the Code of Federal Regulations (CFR) Parts 100-180. Title 49 of the CFR, which contains the regulations set forth by the HMTA, specifies requirements and regulations with respect to the transport of hazardous materials. It required that every

employee who transports hazardous materials receive training to recognize and identify hazardous materials and become familiar with hazardous material requirements. under the HMTA, the Secretary of Transportation "may authorize any officer employee, or agent to enter upon, inspect, and examine, at reasonable times and in a reasonable manner, the records and properties of persons to the extent such records and properties related to (1) the manufacture, fabrication, marking, maintenance, reconditioning, repair, testing, or distribution of packages or containers for use by any "persons" in the transportation of hazardous materials in commerce; or (2) the transportation or shipment by any "person" of hazardous materials in commerce."

Clean Water Act/ Spill Prevention, Control and Countermeasure (SPCC) Rule

The Clean Water Act (CWA) (33 U.S.C. § 1251 et seq.) was enacted with the intent of restoring and maintaining the chemical, physical, and biological integrity of the waters of the United States. The CWA requires states to set standards to protect, maintain, and restore water quality through the regulation of point source and certain non-point source discharges to surface water. Those discharges are regulated by the National Pollutant Discharge Elimination System (NPDES) permit process (CWA Section 402). In California, NPDES permitting authority is delegated to, and administered by, the nine Regional Water Quality Control Boards (RWQCBs). The project site is within the jurisdiction of the Santa Ana RWQCB.

Section 402 of the CWA authorizes the California State Water Resources Control Board (SWRCB) to issue NPDES General Construction Storm Water Permit (Water Quality Order 99-08-DWQ), referred to as the "General Construction Permit."

Construction activities can comply with and be covered under the General Construction Permit provided that they:

- Develop and implement a Storm Water Pollution Prevention Plan (SWPPP) which specifies Best Management Practices (BMPs) that will prevent all construction pollutants from contacting stormwater and with the intent of keeping all products of erosion from moving off-site into receiving waters;
- Eliminate or reduce non-stormwater discharges to storm sewer systems and other waters of the nation; and
- Perform inspections of all Best Management Practices (BMPs).

NPDES regulations are administered by the RWQCB. Projects that disturb one or more acres are required to obtain NPDES coverage under the Construction General Permits.

Occupational Safety and Health Administration (OSHA)

Congress passed the Occupational and Safety Health Act (OSHA) to ensure worker and workplace safety. Their goal was to make sure employers provide their workers with a place of employment free from recognized hazards to safety and health, such as exposure to toxic chemicals, excessive noise levels, mechanical dangers, heat or cold stress, or unsanitary conditions. To establish standards for workplace health and safety, OSHA also created the National Institute for Occupational Safety and Health as the research institution for OSHA. The Administration is a division of the U.S. Department of Labor that oversees the administration of OSHA and enforces standards in all states. OSHA standards are listed in Title 29 CFR Part 1910.

OSHA's Hazardous Waste Operations and Emergency Response Standard applies to five groups of employers and their employees. This includes any employees who are exposed or potentially exposed to hazardous substances (including hazardous waste) and who are engaged in clean-up operations; corrective actions; voluntary clean-up operations; operations involving hazardous wastes treatment, storage, and disposal facilities; and emergency response operations.

State Regulations

California Code of Regulations, Title 17, Section 35000 et seq.

Title 17, Section 35000 et seq. of the California Code of Regulations (CCR) specifically addresses lead-based paint activities. This regulation sets standards and requirements for individuals and firms engaged in various lead-based paint activities, including inspection, risk assessment, abatement, and clearance testing.

The regulation outlines the qualifications and certification requirements for individuals conducting lead-based paint activities. It also establishes procedures for conducting inspections and risk assessments to identify lead hazards in buildings. Additionally, it provides guidelines for the safe and effective removal or containment of lead-based paint during abatement activities.

The regulation also specifies the requirements for clearance testing, which is conducted after lead-based paint abatement to ensure that the area is free from lead hazards. It outlines the sampling and analysis methods to be used during clearance testing and the acceptable clearance levels for different surfaces.

Furthermore, Title 17, Section 35000 et seq. of the CCR includes provisions related to record keeping, notification requirements, and enforcement mechanisms to ensure compliance with the regulations.

California Environmental Protection Agency

California Environmental Protection Agency (CalEPA) has jurisdiction over hazardous materials and wastes at the State level. DTSC is the department of CalEPA responsible for implementing and enforcing California's own hazardous waste laws, which are known collectively as the Hazardous Waste Control Law. Department of Toxic Substances Control (DTSC) regulates hazardous waste in California primarily under the authority of the federal and the California Health and Safety Code (primarily Division 20, Chapters 6.5 through 10.6, and Title 22, Division 4.5). Although similar to RCRA, the California Hazardous Waste Control Law and its associated regulations define hazardous waste more broadly and regulate a larger number of chemicals. Hazardous wastes regulated by California but not by the U.S. EPA are called "non-RCRA hazardous wastes." Other laws that affect hazardous waste are specific to handling, storage, transportation, disposal, treatment, reduction, cleanup, and emergency planning. Government Code Section 65962.5 (commonly referred to as the Cortese List) includes DTSC-listed hazardous waste facilities and sites, Department of Health Services lists contaminated drinking water wells, sites listed by the SWRCB as having UST leaks and have had a discharge of hazardous wastes or materials into the water or groundwater and lists from local regulatory agencies of sites that have had a known migration of hazardous waste/material.

DTSC directive enforcement is handled at the local level, in this case the San Bernardino County Department of Environmental Health (DEH). The RWQCB also has the authority to implement regulations regarding the management of soil and groundwater investigation.

CalFire Strategic Fire Plan 2024

California Department of Forestry and Fire Protection (CalFire) uses this plan to direct and guide its fire management activities for the State Responsibility Area throughout California. CalFire's mission is to serve and safeguard the people and protect the property and resources of California. CalFire responds to emergencies such as fires of all types, vehicle accidents, floods, earthquakes, hazardous material spills, and others within the State Responsibility Area. CalFire provides direction for fire prevention using fire resource assessments, a variety of available data, mapping and other tools. The plan emphasizes "pre-fire" management, which is a process to assess alternatives to protect assets from unacceptable risk of wildland fire damage and focus on those actions that can be taken in advance of a wildland fire to potentially reduce the severity of the fire and ensure safety. Pre-fire management activities include prescribed burning, fuel breaks, forest health treatments and removal of hazardous vegetation.

CalFire has mapped fire threat potential throughout California. It ranks fire threats based on the availability of fuel and the likelihood of an area burning (based on topography, fire history, and climate). The rankings include no fire threat, moderate, high, and very high fire threat.

California Fire Code

CCR, Title 24, also known as the California Building Standards Code, contains the California Fire Code (CFC), included as Title 24, Part 9. The CFC includes provisions and standards for emergency planning and preparedness, fire service features, fire protection systems, hazardous materials, fire flow requirements, and fire hydrant locations and distribution.

The CFC, Chapter 9 of Title 24 of the CCR, was created by the California Building Standards Commission based on the International Fire code and is updated every three years. The overall purpose of the CFC is to establish the minimum requirements to safeguard the public health, safety, and general welfare from the hazards of fire, explosion, or dangerous conditions in new and existing buildings, structures, and premises, and to provide safety and assistance to firefighters and emergency responders during emergency operations. Chapter 49 of the CFC contains minimum standards for development in the wildland–urban interface and fire hazard areas. The CFC also provides regulations and guidance for local agencies in the development and enforcement of fire safety standards.

California Water Code

The California Water Code is a collection of laws and regulations that govern the management and use of water resources within the State of California. It covers various aspects related to water rights, water quality, water supply, water conservation, and water infrastructure. The code outlines the responsibilities of state agencies, local governments, and water districts in managing and protecting California's water resources. Additionally, it addresses issues such as groundwater management, water pollution control, flood control, and water infrastructure development. The California Water Code plays a crucial role in ensuring the sustainable and efficient use of water in California.

Emergency Management Mutual Aid System

The Emergency Management Mutual Aid System (EMMAS) is a collaborative framework that enables jurisdictions and agencies to request and provide assistance during emergencies. It facilitates the sharing of resources, such as personnel, equipment, and expertise, to enhance the overall effectiveness of emergency response and recovery efforts. EMMAS operates through mutual aid agreements, promoting

interoperability, coordination, and a seamless integration of resources from different jurisdictions. Its main goal is to ensure a coordinated and efficient response to emergencies that surpass the capabilities of a single jurisdiction.

Hazardous Materials Release Response Plans and Inventory Act of 1985

The California Health and Safety Code, Division 20, Chapter 6.95, known as the Hazardous Materials Release Response Plans and Inventory Act or the Business Plan Act, requires businesses using hazardous materials to prepare a plan that describes their facilities, inventories, emergency response plans, and training programs. Businesses must submit this information to the County DEH. The Environmental Health Division verifies the information and provides it to agencies responsible for protection of public health and safety and the environment. Business Plans are required to include emergency response plans and procedures in the event of a reportable release or threatened release of a hazardous material, including, but not limited to, all of the following:

- Immediate notification to the administering agency and to the appropriate local emergency rescue personnel.
- Procedures for the mitigation of a release or threatened release to minimize any potential harm or damage to persons, property, or the environment.
- Evacuation plans and procedures, including immediate notice, for the business site.

Business Plans are also required to include training for all new employees, and annual training, including refresher courses, for all employees in safety procedures in the event of a release or threatened release of a hazardous material.

Hazardous Waste Control Act

The Hazardous Waste Control Act created the State hazardous waste management program, which is similar to but more stringent than the federal RCRA program. The act is implemented by regulations contained in CCR Title 26, which describes the following required aspects for the proper management of hazardous waste: identification and classification; generation and transportation; design and permitting of recycling, treatment, storage, and disposal facilities; treatment standards; operation of facilities and staff training; and closure of facilities and liability requirements. These regulations list more than 800 materials that may be hazardous and establish criteria for identifying, packaging, and disposing of such waste. Under the Hazardous Waste Control Act and Title 26, the generator of hazardous waste must complete a manifest that accompanies the waste from generator to transporter to the ultimate disposal location. Copies of the manifest must be filed with the DTSC.

Safe Drinking Water and Toxic Enforcement Act of 1986

The Safe Drinking Water and Toxic Enforcement Act of 1986, commonly referred to as Proposition 65, requires businesses to provide warnings to individuals about potential exposure to chemicals known to cause cancer, birth defects, or other reproductive harm. Proposition 65 mandates that businesses notify consumers if their products or environments contain any of the listed chemicals above certain threshold levels. The goal of Proposition 65 is to inform individuals about potential risks and allow them to make informed decisions regarding their exposure to these chemicals.

Unified Hazardous Waste and Hazardous Materials Management Regulatory Program

The Unified Hazardous Waste and Hazardous Materials Management Regulatory Program (Unified Program) required the administrative consolidation of six hazardous materials and waste programs (Program Elements) under one agency, a Certified Unified Program Agency (CUPA). The Program Elements consolidated under the Unified Program are Hazardous Waste Generator and On-site Hazardous Waste Treatment Programs ("Tiered Permitting"); Aboveground Petroleum Storage Tank SPCC; Hazardous Materials Release Response Plans and Inventory Program (a.k.a. Hazardous Materials Disclosure or "Community-Right-To-Know"); California Accidental Release Prevention Program (Cal ARP); UST Program; and Uniform Fire Code Plans and Inventory Requirements.

The Unified Program is intended to provide relief to businesses complying with the overlapping and sometimes conflicting requirements of formerly independently managed programs. The Unified Program is implemented at the local government level by CUPAs. Most CUPAs have been established as a function of a local environmental health or fire department. Some CUPAs have contractual agreements with another local agency, a participating agency, which implements one or more Program Elements in coordination with the CUPA. The project site is in San Bernardino County. (The CUPA designated for San Bernardino County is the Hazardous Materials Division of the San Bernardino County Fire Department.)

Department of Toxic Substance Control

The DTSC is a department of CalEPA and is the primary agency in California that regulates hazardous waste, cleans up existing contamination, and looks for ways to reduce the hazardous waste produced in California. DTSC regulates hazardous waste in California primarily under the authority of the federal RCRA and the California Health and Safety Code (primarily Division 20, Chapters 6.5 through 10.6, and Title 22, Division 4.5). Other laws that affect hazardous waste are specific to handling, storage, transportation, disposal, treatment, reduction, cleanup, and emergency planning. Government Code Section 65962.5 (commonly referred to as the Cortese List) includes DTSC-listed hazardous waste facilities and sites; Department of Health Services lists of contaminated drinking water wells; sites listed by the SWRCB as having UST leaks and have had a discharge of hazardous wastes or materials into the water or groundwater; and lists from local regulatory agencies of sites that have had a known migration of hazardous wastes and/or materials.

California Office of Emergency Services

To protect the public health and safety and the environment, the California Office of Emergency Services is responsible for establishing and managing statewide standards for business and area plans relating to the handling and release or threatened release of hazardous materials. Basic information on hazardous materials handled, used, stored, or disposed of (including location, type, quantity, and health risks) needs to be available to firefighters, public safety officers, and regulatory agencies. The information must be included in these institutions' business plans to prevent or mitigate the damage to the health and safety of persons and the environment from the release or threatened release of these materials into the workplace and environment.

These regulations are covered under Chapter 6.95 of the California Health and Safety Code Article 1 – Hazardous Materials Release Response and Inventory Program (§§ 25500 to 25520) and Article 2 – Hazardous Materials Management (§§ 25531 to 25543.3). CCR Title 19, Public Safety, Division 2, Office of Emergency Services, Chapter 4 – Hazardous Material Release Reporting, Inventory, and Response Plans,

Article 4 (Minimum Standards for Business Plans) establishes minimum statewide standards for Hazardous Materials Business Plans. These plans shall include the following: (1) a hazardous material inventory in accordance with Section 2729.2 to 2729.7; (2) emergency response plans and procedures in accordance with Section 2731; and (3) training program information in accordance with Section 2732. Business plans contain basic information on the location, type, quantity, and health risks of hazardous materials stored, used, or disposed of in the State. Each business shall prepare a Hazardous Materials Business Plan (HMBP) if that business uses, handles, or stores a hazardous material or an extremely hazardous material in quantities greater than or equal to the following: 500 pounds of a solid substance, 55 gallons of a liquid, 200 cubic feet of compressed gas, a hazardous compressed gas in any amount, or hazardous waste in any quantity.

California Occupational Safety and Health Administration

The California Occupational Safety and Health Administration (Cal/OSHA) is the primary agency responsible for worker safety in the handling and use of chemicals in the workplace. Cal/OSHA standards are generally more stringent than federal regulations. The employer is required to monitor worker exposure to listed hazardous substances and notify workers of exposure (8 CCR §§ 337-340). The regulations specify requirements for employee training, availability of safety equipment, accident-prevention programs, and hazardous substance exposure warnings. In addition, Cal/OSHA regulates medical and/or infectious waste.

Division of Oil, Gas and Geothermal Resources Map

To evaluate the presence of oil or gas wells on-site and in the immediate site vicinity, maps available online at the California Department of Conservation, Geologic Energy Management Division (CalGEM) were reviewed. No abandoned/plugged oil/gas wells are located on the project site.

License to Transport Hazardous Materials – California Vehicle Code, Section 32000.5 et seq

In California, Section 31303 of the California Vehicle Code states that any hazardous material being moved from one location to another must use the route with the least travel time. This, in practice, means major roads and highways, although secondary roads are permitted to be used for local delivery. These policies are enforced by both the California Highway Patrol and the California Department of Transportation (Caltrans).

Tanner Act

The Tanner Act (AB 2948) was adopted in 1986 and governs the preparation of hazardous waste management plans and sites the location of hazardous waste facilities in the State of California. The Tanner Act also requires that each county adopts a Hazardous Waste Management Plan which needs to include provisions that define the planning process for waste management, the permit process for new or expanded facilities, and the appeal process to the State available for certain local decisions.

California Accidental Release Prevention (CalARP) Program

The California Accidental Release and Prevention (CalARP) program was implemented in 1997, and its purpose is to prevent accidental release of substances that can cause harm to the public and environment and minimize damage if releases do occur. CalARP requires facilities that handle, manufacture, use, or store any regulated substances above threshold quantities to submit a Risk Management Plan and proactively prevent and prepare for accidental releases. The Cal EPA oversees the implementation of

CalARP at the State level while CUPAs and/or participating agencies implement CalARP program at the local level.

Regional and Local Regulations

South Coast Air Quality Management District (SCAQMD)

The SCAQMD is the air pollution control agency for Orange County and the urban portions of San Bernardino, Los Angeles, and Riverside counties. The agency's primary responsibility is ensuring that State and federal ambient air quality standards are attained and maintained in the Southern California Air Basin (SCAB). The SCAQMD is also responsible for adopting and enforcing rules and regulations concerning air pollutant sources, issuing permits for stationary sources of air pollutants, inspecting stationary sources of air pollutants, responding to citizen complaints, monitoring ambient air quality and meteorological conditions, awarding grants to reduce motor vehicle emissions, conducting public education campaigns, and many other activities. All projects are subject to SCAQMD rules and regulations in effect at the time of construction.

The following is a list of SCAQMD rules that are required of construction activities associated with the Project:

Rule 403 (Fugitive Dust) – This rule requires fugitive dust sources to implement best available control measures for all sources, and all forms of visible particulate matter are prohibited from crossing any property line. This rule is intended to reduce PM_{10} emissions from any transportation, handling, construction, or storage activity that has the potential to generate fugitive dust. PM_{10} suppression techniques are summarized below.

a) Portions of a construction site to remain inactive longer than a period of three months will be seeded and watered until grass cover is grown or otherwise stabilized.

b) All on-site roads are paved as soon as feasible, watered regularly, or chemically stabilized.

c) All material transported off-site will be either sufficiently watered or securely covered to prevent excessive amounts of dust.

d) The area disturbed by clearing, grading, earthmoving, or excavation operations will be minimized at all times.

e) Where vehicles leave a construction site and enter adjacent public streets, the streets will be swept daily or washed down following the workday to remove soil from pavement.

Rule 1166 – This rule sets requirements to control the emission of volatile organic compounds (VOC) from excavating, grading, handling and treating VOC-contaminated soil as a result of leakage from storage or transfer operations, accidental spillage, or other deposition.

Rule 1403 (Asbestos Emissions from Demolition/Renovation Activities) – This rule sets requirements for limiting asbestos emissions building demolition and renovation activities.

Rialto General Plan

The Rialto General Plan (General Plan) Chapter 5, *Safety and Noise Element* identifies goals and policies related to hazards and hazardous materials. The following list includes General Plan goals and policies that

have been adopted by the City for the purpose of avoiding or mitigating an environmental effect and are applicable to the proposed Project.

Goal 5-1 **Continue to build the City's fire protection and prevention programs and requirements to minimize fire hazards.**

Policy 5-1.3 Require that all site plans, subdivision plans, and building plans be reviewed by the Fire Department to ensure compliance with appropriate fire regulations, such as California Fire Safe Regulations.

Goal 5-2 **Create a more flood-safe community through development standards and infrastructure improvements.**

Policy 5-2.4 Require the implementation of adequate erosion control measures for development projects to minimize sedimentation damage to drainage facilities.

Policy 5-2.6 Design new developments with water retention devices and permeable surfaces to minimize flooding of the surface drainage system by peak flows. Consult with water agencies and the San Bernardino County Flood Control District to consider the potential for larger-scale capture via diversion to large-scale spreading grounds or other options on a site-by-site basis.

Goal 5-5 **Minimize impacts to public health, safety, and welfare as a result of seismic and geologic hazards.**

Policy 5-5.2 Require all construction to be in conformance with the California Building Code (CBC), and to be consistent with the Municipal Code as it provides for earthquake resistant design, excavation, and grading.

Goal 5-8 **Ensure that first responders and the Emergency Operations Center (EOC) have adequate capacity to respond to hazard events.**

Policy 5-8.7 Require that development be phased in relation to the City's ability to provide an adequate level of fire protection, pursuant to the City standard of cover and fire department strategic plan.

Rialto Airport Specific Plan

The Rialto Airport Specific Plan was adopted by the City in November 1997. The Rialto Municipal Airport ceased operations in 2014 and the former airport property and many of the properties adjacent to the Rialto Municipal Airport that were suited to accommodate development were removed from the Rialto Airport Specific Plan and incorporated into the Renaissance Specific Plan, which was adopted by the City in 2010. Although the Rialto Municipal Airport is no longer operational, the Rialto Airport Specific Plan serves as the zoning ordinance for parcels that were not removed; these parcels are primarily northwest, west, and east of the former Rialto Municipal Airport. The Rialto Airport Specific Plan also provides a framework to guide future land use and development decisions in this area. The Rialto Airport Specific Plan does not contain specific policies related to hazards that would currently be applicable to hazards because of the closure of the airport.

City of Rialto Standardized Emergency Management System (SEMS)/National Incident Management System (NIMS) Multi-Hazard Functional Plan (MHFP)

The City of Rialto (City) provides fire and emergency response services to residents and businesses in the City. The City has adopted the Standardized Emergency Management System (SEMS)/National Incident Management System (NIMS) Multi-Hazard Functional Plan (MHFP) to address the City's planned response to extraordinary emergency situations associated with natural disasters, technological incidents, and national security emergencies. The objective of the MHFP is to incorporate and coordinate all the facilities and personnel of the City into an efficient organization capable of responding to any emergency.

City of Rialto Fire Code

The California Fire Code sets forth requirements including those for building materials and methods pertaining to fire safety and life safety, fire protection systems in buildings, emergency access to buildings, and handling and storage of hazardous materials. The City adopted the California Fire Code with certain amendments, additions, and deletions, codified under Rialto Municipal Code (Municipal Code) Chapter 15.28.

4.8.3 Existing Conditions

Current Use

The project site is primarily vacant, with the exception of remnants of a World War II-era bunker structure and rail spurs in the southern portion of the project site and an underground transformer on the northwestern portion of the project site along Lowell Street. The project site is located within the Rialto Airport Specific Plan and zoned General Manufacturing (I-GM). There are no on-site operations.

Current Use of Adjacent Properties

The surrounding area is comprised primarily of industrial, warehouse, manufacturing and office uses with single-family residences east of Locust Avenue and the Mid-Valley Landfill to the west. **Table 4.8-1: Adjacent Properties**, lists the land uses adjacent to the project site.

Table 4.8-1: Adjacent Properties

Direction Relative to the Project Site	Description
North	Industrial land uses including concrete supplier, construction equipment service provider, pipe manufacturer, corporate office, recycling plant, and warehouse to the north of Lowell Street.
South	Industrial land uses including concrete mixing operation facility, warehouse, and truck container storage yards.
East	Industrial land uses including water damage restoration service provider, steel distributor and fabricator, storage yards, warehouses west of Locust Avenue. An undeveloped parcel and industrial land uses including towing service, warehouse, steel distributor, and a concrete contractor east of Locust Avenue.
West	Industrial land uses including a concrete supplier, Robertson's Ready Mix materials yards, and Mid-Valley Landfill west of Lake Padden Lane.

Source: See **Section 3.0: Project Description**, Table 3-1: On-Site and Surrounding Land Uses, General Plan, and Zoning.

Historical Use of Site

According to the Phase I ESA the project site was developed in the 1940s by the U.S. Army with rail spurs and a bunker for the storage and transportation of ammunition at the southern portion of the site. The project site was primarily used for weapons and ammunition storage until the 1960s when military operations within the project site ended. Since the 1960s, the site has been generally vacant; however, portions of the project site have been used for storage by various adjacent land uses. Off-site land uses have included other facilities involved in the manufacture of pyrotechnic products.

Phase I Environmental Site Assessment

A Phase I ESA was prepared by Hazard Management Consulting, Inc. in July 2023. This investigation included a site walk, review of regulatory databases, aerial photographs, City directories, Sanborn Maps, and topographic maps and review of records from the San Bernardino County Fire Protection District, SCAQMD, and City of Rialto (see **Appendix G1**).

The Phase I ESA found that the project site is located within the 160-acre area and the former bunker area of the larger Rockets, Fireworks, and Flares (RFF) Superfund site (formerly known as the B.F. Goodrich site). These areas were used for approximately 60 years by several facilities including the U.S. Army, defense contractors, fireworks manufacturers, and other facilities that used perchlorate salts and chlorinated solvents. These facilities have resulted in the release of perchlorates and volatile organic compounds (VOCs) to soil and groundwater, resulting in an approximately seven mile long groundwater plume that extends beneath the project site and to the southeast. It should be noted there has been no data obtained to suggest the site has contributed to any of these underlying conditions.

Database Review

The Phase I ESA database review considered the potential and likelihood of contamination from adjoining and nearby sites.

Goodrich Corporation: located on a 160-acre area around Locust Avenue, Rialto, CA (adjacent to the project site to the north). This facility was plotted at the project site in the Environmental Data Report (EDR) Radius research; however, the records were for the former BF Goodrich facility, which is part of the

RFF Superfund. As noted above, the site is located within the boundaries of the RFF Superfund site. From about 1957 to 1962, B.F. Goodrich Corporation conducted research, development, testing, and production of solid-fuel rocket propellant containing ammonium perchlorate and used solvents in the manufacturing process. Since the 1960s, the 160-acre area has been used by a number of companies that manufactured or sold pyrotechnics, including Pyrotronics, Pyro Spectaculars, and American Promotional Events. In 2002, the SWRCB began actively working with Potentially Responsible Parties and property owners to investigate soil and groundwater contamination at the B.F. Goodrich site and in surrounding areas. In September 2009, the U.S. EPA added the B.F. Goodrich site to the Superfund National Priorities List. Between 2003 and 2013, numerous investigations have been conducted to determine the extent of soil and groundwater contamination. The studies have included the collection and analysis of soil samples, the collection and analysis of soil gas samples, the installation of groundwater monitoring wells, and/or the collection and analysis of groundwater samples. The studies were overseen by the SWRCB, the U.S. EPA, and the DTSC. A second groundwater remedy was constructed between 2015 and 2021 to remove perchlorate from extracted groundwater; pipelines and pumps to convey the treated water from the treatment plant to the City of Rialto's water distribution system for use as drinking water supply; and a groundwater monitoring program. In January 2022, the U.S. EPA proposed a third groundwater cleanup remedy to address contaminated groundwater in the "mid-basin" area which has moved past downgradient of 160-acre area. Eleven multi-level groundwater monitoring wells were installed; testing is ongoing.

Rocket, Fireworks, and Flares (RFF) Site is located at 3196 Locust Avenue, directly adjacent to the north of the project site. This 160-acre area was formerly occupied by B.F. Goodrich, the U.S. Army, and other facilities. The project site is listed in the EDR radius search, SWRCB GeoTracker database for sites requiring cleanup, and DTSC Envirostor database for hazardous waste sites for perchlorate salts in their manufacturing processes; refer to the discussion of the Goodrich Company above for additional background information. Perchlorate releases from these facilities have impacted the regional groundwater basin known as the Eastern Plume. Some of the facilities have also been identified as a source of VOC releases that have affected soil and groundwater. Given that groundwater is found at depths greater than 400 feet below ground surface (bgs) in the vicinity of the project site, it is very unlikely that the VOC releases pose a potential vapor intrusion condition. As previously noted, the site is located within the boundaries of the RFF Superfund site and there has been no data obtained to suggest the site has contributed to these underlying conditions. The U.S. EPA and DTC have not required any investigations on the site itself.

Mid-Valley Sanitary Landfill is located at 2390 Alder Avenue approximately 96 feet south of the project site. The landfill totals 497 acres with approximately 222 acres used for waste disposal activities. The operations at this landfill resulted in perchlorate and VOC releases, including trichloroethylene (TCE), that have impacted groundwater. The resulting plume is referred to as the Western Plume which is separated from the Eastern Plume by a "low concentration trough." This facility is not considered a Recognized Environmental Condition (REC) due to the location in relation to the site as well as the depth and direction of groundwater.

General Environmental Concerns

Hazardous Substances and Petroleum Products Used or Stored at the Site. No hazardous substances or petroleum products were observed on the project site during the site reconnaissance.

Aboveground and Underground Hazardous Substance or Petroleum Product Storage Tanks (ASTs/USTs). Aboveground storage tanks (ASTs) and underground storage tanks (USTs) are used to store many kinds of products and substances that may be dangerous to humans and the environment such as petroleum fuel or pesticides. Given the lack of maintenance or abandonment, ASTs and USTs may release stored substances into the ground and affect both soil and underlying groundwater. No evidence of current or former ASTs or USTs was observed on the project site during the site reconnaissance.

Surface Releases. Surficial release involves the release of any substance onto the ground surface. These could occur from oil spills or leaking ASTs and can be identified visually by stained surfaces or soil testing. Surficial release was identified along Lowell Street during a previous soil investigation effort in 2009, and a soil remediation effort removed diesel-contaminated soil at the project site's northern center portion by Lowell Street. All contaminated soils were removed and properly disposed. No project site spills, stains, or other indications of surficial releases were observed during the May 30, 2023, site reconnaissance.

Asbestos-Containing Materials (ACM). Asbestos is a mineral fiber that was most commonly used prior to 1980 in various building construction materials (e.g., floor tiles, roofing materials, thermal system insulation, mastics) for insulation, strength, and fire-retardant purposes. Such materials may have been used in construction well into the 1980s and 1990s and, because of the possible storage of surplus materials/supplies, could still be used at present day construction sites. Some non-friable modern building materials, such as roofing felt, vinyl asbestos floor tile, ceiling tiles, and transited building materials still contain asbestos. Asbestos has also been used in manufactured items such as automobile brakes, heat-resistant fabrics, gaskets, and coatings. When repair, remodeling, or demolition activities damage or disturb ACM, microscopic fibers become airborne and can be inhaled into the lungs. The bunker and structure identified at the southern portion of the project site contained tar-like roofing compound which was suspected to contain ACM.

Lead Based Paint (LBP). Historically, lead was used as a pigment and drying agent in oil-based paint. In 1978, the federal government banned the consumer use of lead-containing paint.[1] As noted above, the project site contains an ammunitions bunker and brick and mortar structure which were constructed in the 1940s. Since these were built before 1978, these buildings may contain LBP on both interior and exterior architectural surfaces. Additionally, LBP may have been used in commercial/industrial buildings subsequent to 1978, as well as in residential structures (paint purchased prior to 1978 but stored and used in subsequent years).

Polychlorinated Biphenyls (PCBs). Examples of PCB-containing equipment include transformers, oil-filled switches, hoists, lifts, dock levelers, hydraulic elevators, etc. No potential PCB-containing equipment was observed on the project site during the site 2023 reconnaissance.

Radon. Radon is a colorless, odorless, naturally occurring, radioactive, inert, gaseous element formed by radioactive decay of radium (Ra) atoms. The U.S. EPA has prepared a map to assist national, State, and local organizations to target their resources and to implement radon-resistant building codes. Review of the U.S. EPA Map of Radon Zones indicated that the project site is located within Zone 2. Zone 2 has a moderate potential for radon levels between 2.0 and 4.0 picocuries per liter (pCi/L). Based upon the radon

[1] EPA. 2024. *Protect Your Family from Sources of Lead.* Retrieved from https://www.epa.gov/lead/protect-your-family-sources-lead#:~:text=In%201978%2C%20the%20federal%20government,is%20usually%20not%20a%20problem. Accessed August 12, 2024.

zone classification, radon is not considered to be a significant environmental concern for the project site. Therefore, radon sampling was not conducted as part of Phase I or Phase II ESA.

Recommendations

Phase I ESA identified a Historical Recognized Environmental Concern (HREC) associated with a soil remediation effort in 2009 for the removal of hydrocarbons. HRECs are previously identified RECs that have been properly addressed and therefore no longer a concern. Additionally, the following RECs were identified in the Phase I ESA:

- The project site's location within the 160-acre area and the former bunker area of the RFF Superfund Site
- Historical use of the site for the storage of munitions and one remaining bunker
- Unknown suspected uses of the site by adjoining pyrotechnic facilities

In response to the identified RECs, a Phase II ESA that includes the collection of soil vapor samples was recommended.

Phase II Environmental Site Assessment

The Phase II ESA was prepared by Hazard Management Consulting in July 2023. The purpose of the assessment was to collect soil and soil gas samples and assess whether concentrations of chemicals of potential concern warrant further action. The assessment included an unexploded ordnance (UXO) review, a geophysical survey, soil sampling and soil vapor sampling and evaluated whether significant releases of hazardous substances have occurred at the project site including VOCs, organochlorine pesticides, and percolate.

Unexploded Ordnances (UXOs) are explosives that are used but fail to function as intended (explode) while discarded military munitions (DMMs) are munitions that are abandoned or improperly disposed. The UXO review included evaluation of historical records, databases and aerial photographs from the ESA and concluded that:

- Explosive risks from fireworks or their components has been deemed as "Very Low" for the 40-acre project site.
- Explosive risks from military munitions has been deemed as "Very Low" for the 40-acre project site.

Due to the historical use of the project site and neighboring properties, a subsurface evaluation was prepared and included as part of the Phase II ESA. The subsurface evaluation included a focused survey to identify the potential for metals including UXOs to be present in the drill areas by using electromagnetic induction, magnetometry, ground penetrating radar, and utility locators with line tracing capabilities. Specifically, the high-resolution, high-sensitivity metal-detecting instruments are designed for the detection and characterization of UXOs. No pipes, conduits, utilities, or significant substructures were detected within a five-foot radius of any of the proposed boreholes and proposed infiltration points, and within a 10-foot radius of the proposed trench locations. The geophysical survey found small, isolated, and nondescript metallic anomalies on the project site.

Although no UXOs or DMMs were found during the survey, it is important to note that the focused survey was limited to portions of site due to significant shrubs and thick vegetation, as well as physical

obstructions (bunker, K-rails). Removal of all ground vegetation and physical obstructions would be required to complete a full survey of the project site. Therefore, a potential for UXOs and DMMs to exist on the project site remains and it was recommended that future development include the use of a UXO consultant when removing surficial features and during grading.

The soil sampling investigation activities were generally collected across the entire property including in areas with known RECs and did not identify any residual sources of chemical constituents. Project site soil samples did not identify a significant soil VOC, perchlorate, or pesticide concentration, and therefore determined the project site would not be a contributor to the Eastern Plume based on concentrations below regulatory screening levels. Soil vapor testing indicated that benzene, a type of VOC, was detected above regulatory screening levels. However, benzene detections were generally low at 33 micrograms/m3 and indicated that residual benzene source likely does not exist at the project site. Further, the levels of benzene observed in the soil vapor are commonly observed at commercial and industrial properties. The soil and soil vapor results do not provide evidence that a release of hazardous substances has occurred at the Site that would result in contamination of the underlying groundwater. The Phase II ESA concluded that the items previously identified as RECs (see Phase I discussion above) have been revised to "*de minimis*"[2] (of minimal environmental concern) conditions because they were not found to be a contributor to the plume that is the basis for the Superfund site designation.

As noted above, the Phase II ESA did recommend that a UXO specialist be available during removal of the remaining surficial features and soil disturbance out of an abundance of caution.

4.8.4 Methodology

In determining whether Project implementation would result in impacts concerning hazards or hazardous materials, this analysis considers the recommendations of CEQA Guidelines Appendix G as described below. The evaluation was based on a review of regulations and a determination of the applicability of the regulations within the Project area. The baseline conditions and impact analyses are based on review of Phase I ESA and Phase II ESA (**Appendix G1 and Appendix G2**), analysis of aerial and ground-level photographs, and review of various data available in public records, including local planning documents. The determination that the proposed Project will or will not result in a significant impact with respect to hazards and hazardous materials considers the type of development proposed and whether or not past or current uses on the site have the potential to pose a risk to the proposed Project. Where significant impacts remain despite compliance with the regulatory framework, feasible mitigation measures are recommended, where warranted, to avoid or reduce the Project's potentially significant environmental impacts.

4.8.5 Thresholds of Significance

The following significance criteria for hazards and hazardous materials impacts were derived from the Environmental Checklist in CEQA Guidelines Appendix G. The proposed Project would result in a significant impact related to hazards or hazardous materials if it would:

- Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.

[2] Per ASTM 1527-21, de minimis conditions are not considered RECs.

- Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.
- Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.
- Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, create a significant hazard to the public or the environment.
- Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.

As addressed in **Section 5.1: Effects Found Not to be Significant**, the City has determined that the proposed Project would not have a significant impact on the following thresholds for the reasons stated below, and that no further analysis was required in the EIR:

- For a Project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the Project result in a safety hazard or excessive noise for people residing or working in the project area?

There are no public airports or public use airports located within two miles of the project site. The closest airport is the San Bernardino International Airport, which is approximately 10 miles southeast of the project site. The Rialto Municipal Airport Final Comprehensive Plan (January 1991) is no longer applicable as the airport closed in 2014. The project site is not located within an area subject to an airport land use plan. Therefore, the Project would not result in an airport-related safety hazard or excessive noise for people residing or working in the project area. Therefore, no impact would occur and this threshold is not further addressed in the EIR.

- Would the Project expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?

Fire Hazard Severity Zones (FHSZs) are mapped by the California Department of Forestry and Fire Protection (CAL FIRE) as set forth in Public Resources Code Sections 4201-4204 and Government Code Sections 51175-51189. FHSZs are categorized fire protection within a Federal Responsibility Area under the jurisdiction of a federal agency, a State Responsibility Area (SRA) under the jurisdiction of CAL FIRE, or within a Local Responsibility Area under the jurisdiction of a local agency. CAL FIRE is responsible for fire protection within SRAs. CAL FIRE defines an SRA as land that is not federally owned, not incorporated, does not exceed a housing density of three units per acre, contains wildland vegetation as opposed to agriculture or ornamentals, and has watershed value and/or has range/forage value (this effectively eliminates most desert lands). Where local fire protection agencies, such as the Rialto Fire Department, are responsible for wildfire protection, the land is classified as a Local Responsibility Area (LRA). The project site and its adjacent areas are classified as a Non-VHFHSZ (non-very high FHSZ). Therefore, no impact would occur and this threshold is not further addressed in this EIR section. Fire protection and associated resources are discussed in Section 4.13, Public Services.

4.8.6 Project Impacts and Mitigation

Threshold 4.8-1:	**Would the Project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?**
	Level of Significance: Less than Significant Impact with the incorporation of HAZ MM-1.

Construction

The proposed Project would include the demolition of the ammunitions bunker and brick and mortar structure, which were constructed in the 1940s. Given the age of these structures, ACMs and LBP could be present. Demolition of structures could expose construction personnel to such materials unless proper precautions are taken to minimize exposure. The potential for release of ACMs and LBP during demolition would be considered a significant impact. Because exposure to such materials can result in adverse health effects in uncontrolled situations, regulations and guidelines pertaining to abatement of and protection from exposure to asbestos have been developed for demolition activities. Consistent with SCAQMD Rule 1403, MM HAZ-1 requires a pre-demolition survey to be conducted, and, if identified, ACMs and LBP would be removed and disposed of by qualified contractors in accordance with State regulations.

Project construction activities would involve the transport, use, and disposal of hazardous materials on and off of the project site which include fuels, paints, mechanical fluids, and solvents. However, hazardous materials would not be present in such a quantity or used in a manner that would pose a significant hazard to the public. Use and storage of these potentially hazardous materials would be temporary and would cease upon completion of project construction. Further, should a spill or other hazardous materials incident occur, construction staff would stop work and contact a qualified contractor that is well-versed in handling such a situation. All construction activities would be performed in compliance with the California OSHA Division of Occupational Safety and Health (Cal/OSHA) regulations. Therefore, due to the temporary nature of construction activities, with the implementation of MM HAZ-1 and compliance with applicable State and federal regulations, potential Project construction activities would be mitigated to a less than significant level.

Operations

The proposed Project would include a speculative warehouse. While the future tenants of the building are not currently known, the Project is not anticipated to involve the routine transportation, use, or disposal of hazardous material. The proposed Project would be expected to use limited hazardous materials and substances which would include cleaners, paints, solvents, and fertilizers and pesticides for site landscaping. Project operations would not create a significant impact through the transport, use, or disposal of hazardous materials since the facilities are required to comply with all applicable federal, State, and regional regulations which are intended to avoid impacts to the public and environment. These regulations of the U.S. EPA, the State Department of Health Services, and the SCAQMD ensure that hazardous materials/waste users, generators and transporters provide operational safety and measures to reduce threats to public health and safety. Therefore, given the insignificant amount of regularly transported hazardous materials and compliance with applicable State and federal regulations, Project operations would not create a significant impact through the transport, use, or disposal of hazardous materials. Impacts would be less than significant, and no mitigation would be required.

The routine transport, use, and disposal of hazardous materials can result in hazards to people and the environment, due to the potential for accidental release. Such hazards are typically associated with certain types of land uses, such as chemical manufacturing facilities, industrial processes, waste disposal, and hazardous material storage and distribution facilities. At full buildout, the Project would include one warehouse building and associated infrastructure improvements. This land use is not expected to use significant quantities of hazardous materials or to generate significant quantities of hazardous materials requiring transport. The routine transport, use, and disposal of these materials must adhere to federal, State, and local regulations for transport, handling, storage, and disposal of hazardous substances; such as the Hazardous Materials Transportation Act and Hazardous Materials Release Response Plans and Inventory Act, which address safe handling procedures and emergency response procedures in the event of an accidental release. Therefore, following compliance with applicable federal, State, and local regulations, Project operations would not result in a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials. Impacts would be less than significant, and no mitigation would be required.

Threshold 4.8-2:	**Would the Project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?**
	Level of Significance: Less than Significant Impact with incorporation of MM HAZ-2 through MM HAZ-4.

Construction

The Phase I ESA identified three RECs at the project site: the project site's location within the "160 Acre Area" and "Former Bunker Area" and off-site releases resulting in the Fireworks, Rockets, and Flares Superfund; the historical use of the site for munitions storage; and the unknown suspected use of the site by historic adjacent pyrotechnic facilities. See **Section 4.8.3, Existing Conditions** for additional information on identified RECs. The Phase II ESA included an unexploded ordnance (UXO) review, geophysical survey, soil sampling and soil vapor sampling and evaluated whether significant releases of hazardous substances have occurred at the project site including VOCs, organochlorine pesticides, and percolate.

As discussed above, a subsurface evaluation as part of the Phase II ESA included a focused survey, which did not identify the presence of UXOs or DMMs. However, because the survey could not evaluate the entire project site due to physical limitations, there is still a potential of on-site UXOs and DMMs. Therefore, the proposed Project would implement MM HAZ-2 which would involve a munitions monitor during grading to properly handle and dispose of any encountered UXOs and DMMs. Further, MM HAZ-3 would require the preparation of and compliance with a soil management plan. With implementation of MM HAZ-2 and MM HAZ-3, accident conditions involving the release of hazardous materials from project construction would be reduced to a less than significant level.

Soil sampling and soil vapor sampling indicated that benzene was detected at generally low levels at 33 micrograms/m^3 and indicated that a residual benzene source likely does not exist at the project site. Further, the levels of benzene observed in the soil vapor are commonly observed at commercial and industrial properties. Therefore, benzene in soil vapor does not pose a significant human health risk to indoor air via the vapor intrusion pathway. The Phase II ESA concluded that the soil and soil vapor results do not suggest that the release of hazardous substances has occurred at the project site that would result

in contamination to the underlying groundwater. Although benzene was identified at low levels, to ensure impacts would be less than significant the Project would implement MM HAZ-4 which outlines compliance with Rule 1166 for previously unidentified soil contamination protocol during Project construction. With the implementation of MM HAZ-4, accident conditions involving the release of hazardous materials from project construction would be reduced to a less than significant level.

The project site was not determined to be a contributor to the plume that is the basis for the RFF Superfund site designation. Based on these results, the items previously identified as RECs (see Phase I discussion above) have been revised to "*de minimis*"[3] (of minimal environmental concern) conditions because they do not present a threat to human health or the environment. Therefore, with the implementation of MM HAZ-2 through MM HAZ-4, Project construction impacts concerning accidental release of hazardous materials would be less than significant with mitigation.

Operations

The proposed Project would involve typical hazardous materials/chemicals associated with warehouse uses such as fuels, paints, mechanical fluids, cleaners, solvents, and fertilizers and pesticides for landscaping. However, the types and quantities of materials used and stored on site would not be of a significant quantity to create a reasonably foreseeable upset or accident. Additionally, any routine use, storage, and transport of hazardous materials during Project operations must adhere to federal, State, and local regulations for transport, handling, storage, and disposal of hazardous substances. Hazardous materials/chemicals such as fuels, cleaners, paints, solvents and fertilizers in low quantities do not pose a significant threat related to the release of hazardous materials into the environment. Therefore, Project operations would not result in the accidental release of hazardous materials. Operational impacts would be less than significant, and no mitigation is required.

Threshold 4.8-3:	**Would the Project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?**
	Level of Significance: No Impact

The nearest schools to the project site are Wilmer Amina Carter High School (2630 Linden Avenue) located approximately 0.3-mile southeast of the project site and Kucera Middle School (2140 Buena Vista Drive), located approximately 0.6-mile north of the project site. Therefore, there are no schools within one-quarter mile of the project site. The Project is not anticipated to generate hazardous emissions or involve the handling of hazardous materials, substances, or waste in significant quantities that would have an impact to surrounding schools. The types of hazardous materials that would be routinely handled would be limited to fuels, paints, mechanical fluids, cleaners, solvents, and fertilizers and pesticides for site landscaping. The Project would be required to adhere to all applicable federal, State and regional regulations regarding handling, transport and disposal of hazardous materials. Therefore, the Project would not emit hazardous emissions or handle hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school. No impact would occur, and no mitigation is required.

[3] Per ASTM 1527-21, de minimis conditions are not considered RECs.

Threshold 4.8-4:	**Would the Project be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?**
	Level of Significance: Less than Significant Impact with incorporation of MM HAZ-2 through MM HAZ-4

California Government Code Section 65962.5 requires DTSC to compile a list of hazardous waste facilities that are subject to corrective action.[4] As previously addressed, the project site is located in the southern portion of the "160-Acre Area" and the "Former Bunker Area" of the RFF Superfund site, which was identified as a REC in the Phase I ESA prepared for the Project. Therefore, a Phase II ESA was conducted which included an unexploded ordnance (UXO) review, geophysical survey, soil sampling and soil vapor sampling and evaluated whether significant releases of hazardous substances have occurred at the project site including VOCs, organochlorine pesticides, and percolate. As previously discussed under Threshold 4.8-2, the Phase II ESA identified the potential presence of on-site UXOs and DMMs. Therefore, the proposed Project would implement MM HAZ-2 which would require a munitions monitor and MM HAZ-3 which would require a soil management plan. Additionally, the Phase II ESA concluded that the soil and soil vapor results do not suggest that release of hazardous substances has occurred at the project site that would result in contamination to the underlying groundwater. Although benzene was identified at low levels and would not pose a human health risk, the Project would implement MM HAZ-4 which outlines compliance with Rule 1166 for previously unidentified soil contamination protocol during Project construction. Overall, the Phase II ESA determined that the project site would not be a contributor to the plume that is the basis for the RFF Superfund site designation as conditions do not present a threat to human health or environment. Therefore, although the project site is located within the RFF Superfund site, based on the Phase II ESA findings and compliance with MM HAZ-2 through MM HAZ-4, Project implementation of the Project would not create a significant hazard to the public or the environment and impacts would be reduced to a less than significant level.

Threshold 4.8-5:	**Would the Project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?**
	Level of Significance: Less than Significant Impact

The City has adopted the City of Rialto SEMS/NIMS Multi-Hazard Functional Plan (MHFP),[5] which provides comprehensive policy and guidance for emergency and response operations to natural and manmade hazards. Emergency access to the project site and adjacent streets (i.e., Lowell Street and Locust Avenue) would be maintained during Project construction in compliance with Municipal Code Section 11.04.090(B), which requires all streets to maintain adequate access for emergency vehicles during Project construction per Standard Specifications for Public Works Construction “Green Book” Section 600 et.al. Project operations would also maintain adequate emergency vehicle access. Therefore, the Project would not impair implementation of or physically interfere with an adopted emergency response plan, or

[4] California, State of, Department of Toxic Substances Control, *DTSC's Hazardous Waste and Substances Site List - Site Cleanup (Cortese List).* Retrieved from https://dtsc.ca.gov/dtscs-cortese-list/. Accessed August 12, 2024.

[5] City of Rialto. ND. *SEMS/NIMS Multi-hazard Functional Plan (MHFP)*. SECTION I. Accessed August 12, 2024.

an emergency evacuation plan and impacts would be less than significant, and no mitigation would be required.

4.8.7 Cumulative Impacts

Impacts associated with hazardous materials are often site-specific and localized. The EIR evaluates potential environmental concerns in connection with the project site and surrounding area. The database reviews the findings of various governmental database searches regarding properties with known or suspected releases of hazardous materials or petroleum hydrocarbons within a search radius of up to one mile from the site and serves as the basis for defining the cumulative impacts study area.

Although some of the cumulative projects and other future projects associated with community buildout also have potential impacts associated with hazardous materials, the environmental concerns associated with hazardous materials are typically site-specific excluding the RFF Superfund. Concerning the RFF Superfund, the Project would not disturb the underlying affected groundwater plume as the Project is not anticipated to excavate to a depth of 400 feet below ground surface and, therefore, would not modify or expose the existing Eastern Plume.

Each project is required to address any issues related to hazardous materials or wastes. Cumulative development projects would be required to assess potential hazardous materials impacts on the development site prior to grading. The Project and other cumulative projects would be required to comply with laws and regulations governing hazardous materials and hazardous wastes used and generated as described previously. Projects must adhere to applicable regulations for the use, transport, and disposal of hazardous materials and implement mitigation in compliance with federal, State, and local regulations to protect against site contamination by hazardous materials. Compliance with all applicable federal, State, and local regulations related to hazardous materials would ensure that the routine transport, use, or disposal of hazardous materials would not result in adverse impacts. Additionally, site-specific investigations would be conducted at sites where contaminated soils or groundwater could occur to minimize the exposure of workers and the public to hazardous substances.

Upon compliance with applicable federal, State, and local regulations governing hazardous materials, and implementation of MM HAZ-1, MM HAZ-2, MM HAZ-3, and MM HAZ-4, the potential risks associated with hazardous wastes would be reduced to a level of less than significant. The incremental effects of the proposed Project related to hazards and hazardous materials are anticipated to be minimal, and any effects would be site-specific. Therefore, the Project would not result in incremental effects to hazards with respect to hazardous materials that could be compounded or increased when considered together with similar effects from other past, present, and reasonably foreseeable probable future projects. Therefore, with inclusion of the above referenced mitigation measures, the Project would not result in cumulatively considerable impact to or from hazards or hazardous materials.

4.8.8 Mitigation Program

Standard Conditions

No standard conditions are applicable.

Mitigation Measures

MM HAZ-1 **Asbestos Survey and Lead-Based Paint Survey.** Prior to approval of a demolition permit by the City of Rialto, an asbestos survey and a lead-based paint survey shall be conducted

pursuant to applicable local, State, and federal laws. All asbestos-containing building materials shall be removed prior to structure demolition. Abatement or paint stabilization techniques shall be applied prior to demolition. Such measures shall include removal and stabilization of loose, flaking or peeling paint. Measures shall be taken to ensure that paint chips are not generated in the demolition process. All work shall be performed by an abatement contractor who is certified by the California OSHA Division of Occupational Safety and Health (Cal/OSHA) with properly trained and registered workers. All abatement techniques shall be in accordance with Cal-OSHA and U.S. Environmental Protection Agency (U.S. EPA) protocol and also in conformance with South Coast Air Quality Management District (SCAQMD) rules. All removed asbestos-containing building materials and lead-based paint shall be properly disposed of at a landfill certified to accept said materials, and waste shall be transported under the waste manifest by a certified waste transportation company. Once all of these materials have been removed, structure demolition may commence.

MM HAZ-2 **Munitions Monitor.** Prior to issuance of grading permits, the Applicant shall submit proof to the City of Rialto Director of Community Development of the retainment of a munitions expert. A munitions expert must be an individual that is qualified to perform appropriate tasks per DDESB TP-18 standards. The munitions expert shall be onsite to monitor grading activities for unexploded ordinances (UXOs) and discarded military munitions (DMMs) and provide daily safety briefings before the start of construction. If UXOs are encountered during this process, the munitions expert shall have the authority to halt all or a portion of construction activities and contact the City of Rialto Police department at (909) 820-2550 to report and determine proper UXO handling and disposal. The munitions expert shall have the authority to halt all or a portion of construction activities at their discretion until such time that an encountered UXO is deemed properly disposed.

MM HAZ-3 **Soil Management Plan.** Prior to the issuance of a grading permit, the Applicant shall submit a Soil Management Plan (or equivalent document) to be implemented for construction of the Proposed Project. The objective of the Soil Management Plan is to provide guidance for the proper handling, onsite management, and disposal of impacted soil that might be encountered during construction activities. The plan would include practices that are consistent with the California Title 8, Occupational Safety and Health Administration (Cal-OSHA) regulations, as well as appropriate remediation standards that are protective of the planned use. Appropriately trained professionals would be on site during preparation, grading, and related earthwork activities to monitor soil conditions encountered. The Soil Management Plan would provide guidelines for the following:

- Identifying impacted soil
- Assessing impacted soil
- Soil excavation
- Impacted soil storage
- Verification sampling
- Impacted soil characterization and disposal

The plan shall outline how Project construction crews would identify, handle, and dispose of potentially contaminated soil; identify the qualifications of the appropriately trained professionals that would monitor soil conditions and conduct soil sampling during

construction; coordinate laboratory testing; and oversee disposal. The Soil Management Plan shall also include requirements for documenting and reporting incidents of encountered contaminants, such as documenting locations of occurrence, sampling results, and reporting actions taken to dispose of contaminated materials. In the event that potentially contaminated soils were encountered within the footprint of construction, soils would be tested and stockpiled. The appropriate Certified Unified Program Agency (CUPA) would determine whether further assessment is warranted. The Soil Management Plan shall be submitted to the city and CUPA 45 days prior to the start of construction for review and approval.

MM-HAZ 4 **Contaminated Soil Treatment.** If previously unidentified soil contamination is observed by sight or odor or indicated by testing by a qualified professional using a portable volatile organic compound analyzer during excavation and grading activities, excavation and grading within such an area shall be temporarily halted and redirected around the area until the appropriate evaluation and follow-up measures are implemented, as contained in the South Coast Air Quality Management District's Rule 1166, to make the area suitable for grading activities to resume. In the event contamination is found, the Applicant shall notify the San Bernardino County Fire Department, the South Coast Air Quality Management District, as applicable. The contaminated soil shall be evaluated and excavated/disposed of, treated in-situ (in-place), or otherwise managed and disposed of in accordance with all applicable federal, State, and local laws and regulation.

4.8.9 Level of Significance After Mitigation

Potential impacts to hazards and hazardous materials would be reduced to a level considered less than significant after implementation of the specified mitigation set forth in this section.

4.9 HYDROLOGY AND WATER QUALITY

4.9.1 Introduction

This section of the EIR identifies and analyzes the hydrologic resources available to the proposed Project while assessing the potential impact the Project could have on those resources. The pre-development conditions of the water and drainage systems surrounding the project site were used as a baseline with which to compare potential impacts associated with the Project and will inform the degree of impact that the proposed Project could have on those existing hydrologic systems. Federal, State, regional, and local regulations will provide further context regarding the area's hydrologic resources. Impacts in this section are assessed regarding their effects on water quality, groundwater availability, and other hydrological conditions of the area. The analysis also considers the proposed Project's potential effects in flood, tsunami, and seiche zones.

The Preliminary Drainage Report and the Preliminary Water Quality Management Plan (PWQMP) are summarized in this section and included in their entirety as **Appendix H1: Preliminary Drainage Report** and **Appendix H2: Preliminary Water Quality Management Plan** of this EIR.

4.9.2 Regulatory Setting

Federal Regulations

Clean Water Act

The Clean Water Act (CWA), as amended by the Water Quality Act of 1987, is the major federal legislation governing water quality. The objective of the CWA is "to restore and maintain the chemical, physical, and biological integrity of the Nation's waters." Important applicable sections of the CWA are as follows:

- Section 301 prohibits the discharge of any pollutant by any person, except as in compliance with Sections 302, 306, 307, 318, 402, and 404 of the CWA. Sections 303 and 304 provide for water quality standards, criteria, and guidelines.
- Section 401 requires an applicant for any federal permit that proposes an activity which may result in a discharge to "waters of the United States" to obtain certification from the State that the discharge will comply with other provisions of the CWA. The Regional Water Quality Control Board (RWQCB) provides certification that the proposed action would comply with applicable standards.
- Section 402 establishes the National Pollution Discharge Elimination System (NPDES) a permitting system for the discharge of any pollutant (except for dredge or fill material) into waters of the United States. This permit program is administered by the RWQCB and is discussed later in this section.
- Section 404 establishes a permit program for the discharge of dredge or fill material into waters of the United States. This permit program is administered by the United States Army Corps of Engineers (USACE).

State Regulations

California Porter-Cologne Water Quality Control Act

The State of California's Porter-Cologne Water Quality Control Act (California Water Code § 13000, et seq.) provides the basis for water quality regulation within California. The Porter-Cologne Water Quality Control

Act requires a "Report of Waste Discharge" for any discharge of waste (liquid, solid, or otherwise) to land or surface waters that may impair a beneficial use of surface or groundwater of the State. Waste discharge requirements (WDR) resulting from the report are issued by the RWQCB, as discussed below. In practice, these requirements are typically integrated within the National Pollutant Discharge Elimination System (NPDES) permitting process. The State Water Resources Control Board (SWRCB) carries out its water quality protection authority through the adoption of specific Water Quality Control Plans (Basin Plans). These plans establish water quality standards for bodies of water. California water quality standards are composed of three parts: the designation of beneficial uses of water, water quality objectives to protect those uses, and implementation programs designed to achieve and maintain compliance with the water quality objectives.

Clean Water Act Section 402

Section 402 of the Clean Water Act authorizes the SWRCB, a department of the California Environmental Protection Agency (CalEPA), to issue NPDES General Construction Storm Water Permit (Water Quality Order 99-08-DWQ), referred to as the "General Construction Permit." Construction activities can comply with and be covered under the General Construction Permit provided they:

- Develop and implement a Storm Water Pollution Prevention Plan (SWPPP) which specifies Best Management Practices (BMPs) that will prevent all construction pollutants from contacting stormwater and with the intent of keeping all products of erosion from moving off-site into receiving waters;
- Eliminate or reduce non-stormwater discharges to storm sewer systems and other waters of the nation; and
- Perform inspections of all BMPs.

The SWPPP must contain a visual monitoring program; a chemical monitoring program for "non-visible" pollutants to be implemented if there is a failure of BMPs; and a sediment monitoring plan if the construction site discharges directly to a water body listed on the 303(d) list for sediment. Increased compliance tasks under the adopted 2009 Construction General Permit include project risk evaluation, effluent monitoring, receiving water monitoring, electronic data submission of the SWPPP and all other permit registration documents, and a Rain Event Action Plan, which must be designed to protect all exposed portions of a project site within 48 hours prior to any likely precipitation event. The SWPPP would also include an Erosion Control Plan that would identify specific measures to control on-site and off-site erosion from the time ground disturbing activities are initiated through completion of grading.

Sustainable Groundwater Management Act (2014)

The 2014 Sustainable Groundwater Management Act (SGMA) requires that local Groundwater Sustainability Agencies (GSAs) must be formed for all high and medium priority basins in the State of California. GSAs must be responsible for groundwater management and development of a Groundwater Sustainability Plan or "Alternatives" in its place. It is a long-term statewide framework to help conserve groundwater resources.

California Toxics Rule

In 2000, the California Environmental Protection Agency (CalEPA) promulgated the California Toxics Rule, which establishes water quality criteria for certain toxic substances to be applied to waters in the State.

CalEPA promulgated this rule based on CalEPA's determination that the numeric criteria of specific concentrations of regulated substances are necessary for the State to protect human health and the environment. The California Toxics Rule establishes acute (i.e., short-term) and chronic (i.e., long-term) standards for bodies of water, such as inland surface waters and enclosed bays and estuaries, that are designated by the RWQCB as having beneficial uses protective of aquatic life or human health.

Regional and Local Regulations

Santa Ana Regional Water Quality Control Board

The Santa Ana Regional Water Quality Control Board (Santa Ana RWQCB) regulates State water quality standards in the City of Rialto (City). Beneficial uses and water quality objectives for surface water and groundwater resources in the Project area are established in the water quality control plans of each RWQCB and mandated by the State Porter-Cologne Act and CWA. The RWQCB also implements the CCWA Section 303(d) total maximum daily load (TMDL) process, which consists of identifying candidate water bodies where water quality is impaired by the presence of pollutants. The TMDL process is implemented to determine the assimilative capacity of the water body for the pollutants of concern and to establish equitable allocation of the allowable pollutant loading within the watershed. CWA Section 401 requires an applicant pursuing a federal permit to conduct any activity that may result in a discharge of a pollutant to obtain a water quality certification (or waiver) from the applicable RWQCB.

The RWQCB primarily implements basin plan policies through issuing waste discharge requirements for waste discharges to land and water. The RWQCB is also responsible for administering the NPDES permit program, which is designed to manage and monitor point and non-point source pollution. NPDES stormwater permits for general construction activity are required for projects that disturb more than one acre of land. Municipal NPDES stormwater permits are required for urban areas with populations greater than 100,000. In addition, projects that involve the California Department of Transportation (Caltrans) are required to comply with the Caltrans statewide NPDES permit and associated Stormwater Management Plan (SEMP). Caltrans implements the SEMP in coordination with the RWQCB.

2020 Upper Santa Ana River Watershed Integrated Regional Urban Water Management Plan

The City's Integrated Regional Urban Water Management Plan (IRUWMP) was prepared for cities located within the Upper Santa Ana River Watershed in compliance with the Urban Water Management Planning Act, the Integrated Regional Water Management Planning Act, and other applicable laws and regulations. This document updates and merges the 2015 Upper Santa Ana River Watershed Integrated Regional Water Management Plan (2015 IRWMP) and the 2015 San Bernardino Valley Regional Urban Water Management Plan (2015 RUWMP) into a single comprehensive document for guiding water resource management for the Upper Santa Ana River Watershed, the first of its kind in California.

Rialto General Plan

During project review, approval and permitting, the City requires new development projects to address the quality and quantity of stormwater runoff through the incorporation of permanent (post-construction) BMPs into the Project's design. The City of Rialto General Plan (General Plan)[1] Chapter 2, *Managing Our Land Supply Element*, Chapter 3, *Investing in Our Future: Economic Development, Redevelopment, and Infrastructure,* and Chapter 5, *The Safety and Noise Element* includes

[1] City of Rialto. *City of Rialto General Plan*. Retrieved from https://www.rialtoca.gov/DocumentCenter/View/4457/2023-Land-Use-Element?bidId=. Accessed February 6, 2025.

policies related to stormwater runoff and water quality. The following General Plan goals and policies have been adopted by the City for the purpose of avoiding or mitigating an environmental effect and are applicable to the proposed Project:

Goal 2-18 **Provide high-quality and environmentally sustainable landscaping.**

Policy 2-18.3 Require the use of drought-tolerant, native landscaping and smart irrigation systems for new development to lower overall water usage.

Goal 2-24 **Minimize the visual impact of parking lots.**

Policy 2-24.3 Require use of drainage improvements designed, with native vegetation where possible, to retain or detain water runoff and minimize pollutants into drainage system.

Goal 2-29 **Protect and enhance Rialto's surface waters and groundwater basins.**

Policy 2-29.3 Design sidewalks, roads, and driveways to minimize impervious surfaces; provide flood control channels with permeable bottoms to help restore groundwater aquifers.

Policy 2–29.5 Apply methodologies and assign responsibility to protect the quality of groundwater from pollution by landfills and industrial uses.

Goal 2-30 **Conserve water resources.**

Policy 2-30.1 Require new development to use features, equipment, technology, landscaping, and other methods to reduce water consumption.

Goal 2-31 **Incorporate green building and other sustainable building practices into development projects.**

Policy 2-31.1 Explore and adopt the use of green building standards and Leadership in Energy and Environmental Design (LEED) or similar in both private and public projects.

Goal 3-8 **Promote affordable and quality water service capable of adequately meeting normal and emergency water demands to all areas in Rialto.**

Policy 3-8.10 Support water conservation through requirements for landscaping with drought-tolerant plants and efficient irrigation for all new development and City projects.

Goal 5-2 **Create a more flood-safe community through development standards and infrastructure improvements.**

Policy 5-2.4 Require the implementation of adequate erosion control measures for development projects to minimize sedimentation damage to drainage facilities.

Policy 5-2.6 Design new developments with water retention devices and permeable surfaces to minimize flooding of the surface drainage system by peak flows. Consult with water agencies and the San Bernardino County Flood Control District to consider the potential for larger-scale capture via diversion to large-scale spreading grounds or other options on a site-by-site basis.

Rialto Airport Specific Plan

The Rialto Airport Specific Plan was adopted by the City in November 1997. The Rialto Municipal Airport ceased operations in 2014 and the former airport property and many of the properties adjacent to the Rialto Municipal Airport that were suited to accommodate development were removed from the Rialto Airport Specific Plan and incorporated into the Renaissance Specific Plan, which was adopted by the City in 2010. Although the Rialto Municipal Airport is no longer operational, the Rialto Airport Specific Plan serves as the zoning ordinance for parcels that were not removed; these parcels are primarily northwest, west, and east of the former Rialto Municipal Airport. The Rialto Airport Specific Plan also provides a framework to guide future land use and development decisions in this area. The Rialto Airport Specific Plan does not contain specific policies related to hydrology and water quality but does a Drainage Plan for the Specific Plan area. This Drainage Plan is no longer applicable and has been superseded by requirements identified in the Municipal Code and requirements for site-specific studies for drainage and water quality.

City of Rialto Municipal Code

Title 12 – Public Utilities, Division 3. Stormwater, Chapter 12.60 Municipal Separate Storm Sewer System. Section 12.60.020 - Purpose and objectives.[2] The intent of this chapter is to protect and enhance the quality of watercourses, water bodies, groundwater and wetlands within the city in a manner consistent with the federal Clean Water Act, the Porter-Cologne Water Quality Control Act and the municipal NPDES permit. This chapter is also intended to confirm and consolidate the city's legal authority necessary to control discharges to and from those portions of the municipal separate storm sewer system over which it has jurisdiction as required by the municipal NPDES permit, and thereby fully and timely comply with the terms of the municipal NPDES permit. This chapter is also intended to ensure the health, safety and general welfare of the residents of the city by prescribing reasonable regulations to control effectively non-stormwater discharges containing pollutants into the city's municipal separate storm sewer system to the maximum extent practicable and to achieve the following specific objectives:

A. Control discharges from spills, dumping or disposal of materials other than stormwater;

B. Reduce the discharge of pollutants in all stormwater discharges to the maximum extent practicable;

C. Protect and enhance the water quality of local, State and federal watercourses, water bodies, groundwater and wetlands in a manner pursuant to and consistent with the Clean Water Act and the Porter-Cologne Water Quality Control Act; and

D. Establish penalties for violations of the provisions of this chapter.

Section 12.60.070 - Protection of the municipal separate storm sewer system. No person shall construct, modify or cause to be constructed or modified any structure, facility or appurtenant items which may alter the normal functioning of the city's MS4, including any actions which may alter the capacity, fall or structural integrity of a storm drain, channel or related structures without prior written approval of the city engineer.

[2] City of Rialto. *City of Rialto Municipal Code*. Retrieved from https://library.municode.com/ca/rialto/codes/code_of_ordinances. Accessed February 6, 2025.

Section 17.40.010 - Grading and erosion control required. Every map approved pursuant to this title shall be conditioned on compliance with city requirements for grading and erosion control, including the prevention of sedimentation or damage to off-site property, including, but not limited to, all areas shown on the map as designated remainder on the subdivision or parcel map.

4.9.3 Existing Conditions

Regional Hydrology

The United States is divided into successively smaller hydrological areas, or units, which are then nested within each other. These regions are labeled from largest to smallest as regions (HUC 2), subregions (HUC 4), basins (HUC 6), subbasins (HUC 8), watersheds (HUC 10), and sub watersheds (HUC 12). Hydrological unit boundaries of each designation are delineated based on surface features of their geographic locations. The proposed Project would be located within the Santa Ana watershed, HUC 18070203.[3] The Santa Ana subbasin is the largest watershed in Southern California. The subbasin is home to over six million people and covers an approximately 2,700-square mile area of Orange, Riverside, San Bernardino, and Los Angeles counties. The Santa Ana watershed drains into the Santa Ana River, which flows 100 miles from the crest of San Bernardino Mountains to the Pacific Ocean, near Huntington Beach.[4]

Site Hydrology

The project site is relatively flat. The overall topography of the project site vicinity slopes downward to the south and southeast at gradients of 1.5 to 2.5 percent (**Appendix H1**). The project site currently drains in two directions. The northeast portion of the site drains from the northeast to the southeast direction, eventually exiting onto North Locust Avenue where runoff is conveyed by curb and gutter. The second area generally drains from the northwest to the southeast, eventually discharging towards an existing two-foot channel between the project site and an adjacent warehouse. The project site is part of a larger drainage area tributary to the San Bernadino County Flood Control District Cactus Basin System. The Cactus Basin System is a network of five detention basins that are located between Cactus Avenue and Ayala Drive. Runoff from the project site eventually flows into Cactus Basin number three. The project site does not collect any offsite flows from adjacent properties.[5]

A hydrologic analysis done for the Project determined precipitation values from estimates published in the National Oceanic and Atmospheric Administration Atlas 14.[6] For the City, the 100-year, 1-hour storm precipitation depth equaled 1.81 inches. The 100-year 6-hour and 100-year 24-hour depths equaled 4.82 inches and 9.20 inches, respectively.[7]

Groundwater

The City of Rialto is located within the Upper Santa Ana Valley Groundwater Basin, which consists of nine subbasins, four of which are in the City. According to the IRUWMP, the majority water supply source for the City is groundwater from five local groundwater basins: Chino, Bunker Hill, Lytle Creek, North Riverside, and Rialto-Colton (**Appendix L**). The project site is located within the Rialto-Colton Groundwater Subbasin. The principal recharge areas are Lytle Creek, the southeastern portion of Reche Canyon, and the south-central portion of the Santa Ana River. Smaller amounts of recharge are achieved through percolation of precipitation, underflow, irrigation, and septic returns.

The Rialto-Colton Subbasin is under a "cooperative recharge program" implemented by the San Bernardino Valley Municipal Water District to help replenish high quality groundwater, using State Water Project water and local runoff.[8] Three mechanisms govern groundwater extractions in the Rialto-Colton Subbasin: the Rialto Basin Decree, the Rialto Basin Settlement Agreement, and the Western Judgement. The Rialto Basin Decree provides the rights of the stipulated parties to pump out of the Rialto Basin, which is a smaller area than the Rialto-Colton Subbasin. The Settlement Agreement regulates the water extraction rights on the remaining area of the Rialto-Colton Subbasin outside of the Rialto Basin Decree, referred to as "No-Man's Land." It also resulted in the formation of the Rialto Basin Groundwater Council, which is responsible for implementation of a sustainable groundwater management plan. The Western Judgement and the Rialto Basin Decree both regulate water levels and pumping rights out of the basin. The basin has three index wells that provide mean groundwater level elevations and allow the stipulated parties to impose restrictions on yearly extractions based on thresholds determined for the average standing water levels. These three apparatuses are in place to prevent overdraft of the Subbasin through regulating pumping rights and identifying principal areas of recharge to ensure its existence as a continuous resource for the City.

Per the Geotechnical Investigation conducted for the proposed Project, groundwater was not encountered during explorations drilled to a maximum depth of 25 feet below ground level.[9] The depth to historically high ground water levels in the vicinity of the project site is approximately 279 feet below the ground surface recorded in 1993 (**Appendix F1**). According to the Phase I ESA conducted for the Project, groundwater in 2022 has been recorded at a depth of 460 feet below ground surface in the Project vicinity and is anticipated to be in excess of 400 feet below ground surface at the project site (**Appendix G1**).

Flood Hazard

Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map (FIRM) 06071C7920H shows that the project site is not within a FEMA-mapped special flood hazard area.[10] The project site is classified as Zone X, an area noted as having a minimal flood hazard. In addition, there are no dams, reservoirs, or large bodies of water near the project site. The Lytle Creek Floodway is approximately 2.3 miles east of

the project site and is classified with two primary zones: Zone X, having a 0.2 percent annual chance flood hazard and Zone A, Special Flood Hazard Area Without Base Flood Elevation.[11]

Water Quality

The number of pollutants in the surface runoff is determined by the quantity of a material in the environment and its characteristics. In an urban environment, the quantity of certain pollutants in the stormwater systems is generally associated with the intensity of the land use. Potential stormwater pollutants of concern for the project site include pathogens, various nutrients, sediment, metals, oil and grease, trash and debris, pesticides or herbicides, and organic compounds.[12]

4.9.4 Methodology

A hydrologic analysis was prepared for the Project to assess potential impacts that the development may have on water quality and resources. The analysis was done for both the existing and proposed conditions to serve as a point of comparison.

Runoff calculations were prepared using the Modified Rational Method and the methodology described in Section D of the San Bernadino County Hydrology Manual (August 1986).[13]

The Preliminary Water Quality Management Plan (PWQMP) in **Appendix H2** was prepared to comply with the requirements of the City, County Municipal Storm Water Management Program and the NPDES Areawide Stormwater Program requiring the preparation of a PWQMP. Where significant impacts remain despite compliance with the regulatory framework, feasible mitigation measures are recommended, where warranted, to avoid or reduce the Project's potentially significant environmental impacts.

4.9.5 Thresholds of Significance

The following significance criteria for hydrology and water quality impacts were derived from the Environmental Checklist in CEQA Guidelines Appendix G. The proposed Project would result in a significant impact related to hydrology and water quality if it would:

- Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality.
- Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin.
- Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:
    - i Result in substantial erosion or siltation on- or off-site;
    - ii Substantially increase the rate or amount of surface in a manner which would result in flooding on- or off-site;

[11] Ibid.

[12] Kimley-Horn and Associates, Inc. 2025. *Preliminary Water Quality Management Plan.* Available as **Appendix H2** to this EIR.

[13] Kimley-Horn and Associates, Inc. 2025. *Preliminary Drainage Report*. Available as **Appendix H1** to this EIR.

iii Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or

iv Impede or redirect flood flows.

- In flood hazards, tsunamis, or seiche zones, risk release of pollutants due to project inundation.
- Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan.

4.9.6 Project Impacts and Mitigation

Threshold 4.9-1:	**Would the Project violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality?**
	Level of Significance: Less than Significant Impact

Construction

Project construction activities may include grading and earthmoving activities that could require the use of water for dust mitigation. Water and other liquids, such as fuels, lubricants, or waste can result in water runoff that can move downstream and affect City water quality.

Rialto Municipal Code Chapter 12.60- Municipal Separate Storm Sewer System (MS4) and the State Water Control Board (SWRCB) require a General Construction Storm Water Permit (NPDES Permit), as the project site exceeds the one-acre disturbance limit. Furthermore, the Project must comply with the Santa Ana RWQCB *Santa Ana River Basin Water Quality Control Program*. The Project would disturb approximately 40 acres; therefore, the Project would be subject to the Construction General Permit.

To obtain coverage under the Construction General Permit, the Applicant is required to file Permit Registration Documents with the State Water Board, which include a Notice of Intent (NOI) and other compliance-related documents. The Construction General Permit requires the development and implementation of an SWPPP and monitoring plan, which must include erosion-control and sediment control BMPs that would meet or exceed measures required by the Construction General Permit to control potential construction-related pollutants. Erosion-control BMPs prevent erosion, whereas sediment controls trap sediment once it has been mobilized. The types of required BMPs are relative to the amount of soil disturbed, the types of pollutants used or stored at the project site and proximity to water bodies. Additionally, the Project would be subject to compliance with Municipal Code 12.60.240 through 250, which requires compliance with the General Construction Storm Water Permit and implementation of BMPs to reduce pollutants to the maximum extent possible. Following compliance with NPDES and Municipal Code requirements, which include implementation of BMPs, the Project's construction-related activities would not violate any water quality standards or otherwise substantially degrade surface or groundwater quality. Therefore, impacts would be less than significant, and no mitigation is required.

Operations

Operators of construction sites one-acre or larger would require compliance with SWPPP, the City's Municipal Code Section 12.60.250 and the NPDES General Construction Permit. The NPDES Permit would be applicable to the Project because it would disturb approximately 40 acres. The Project's operator would

also be required to prepare a water quality management plan pursuant to the City's Municipal Code Section 12.60.260.

The Project proposes a network of underground piping that conveys runoff to three on-site underground infiltration basins. The proposed basins serve as both a water quality BMP as well as an underground storage facility to detain and mitigate the peak flow rate. Catch basins located throughout the project site would capture storm flows, and route flows toward underground storm basins for treatment and infiltration. The largest underground storage facility would be located underneath the truck trailer parking lot. Overflow would be routed from the underground basin to a concrete flume that would discharge to the southeast corner of the site on Locust Avenue.

Hydrodynamic separators are included in each underground basin for the pretreatment of larger sediments and pollutants. The underground basins would treat the remaining pollutants of concern through infiltration into and through the subsurface soil. Further, the retention depth of the underground storage provides storage for flow attenuation in the 100-year storm event. For storm events greater than the 100-year peak storm, the proposed 2.5-foot channel located southeast of the site would serve as a drainage point and be used as an overflow method if the existing stormwater infrastructure exceeded its water capacity. The proposed stormwater facilities would require routine maintenance to operate efficiently. Facilities would be inspected prior to the rainy season and after each runoff producing storm event. Sediment and debris would be removed from the pre-treatment system to maintain its effectiveness. The underground basins would be routinely inspected and sediment buildup would be removed to maintain efficient operation of the basins. Therefore, the Project's stormwater infrastructure was designed to capture and treat stormwater flows and would not impact water quality standards. Landscaped areas are also provided throughout the site on areas that are not paved or built over to reduce excess irrigation or stormwater runoff and propose surface filtration.

As included in Standard Condition (SC) HYD-1, compliance with the Construction General Permit, including preparation of a SWPPP containing site-specific BMPs, would reduce the effects of Project construction on water quality. SC HYD-2 requires the Project to produce a WQMP and identify BMPs to incorporate within the Project to control stormwater and non-stormwater pollutants during and after construction. SC HYD-3 discusses the preparation of an Erosion Control Plan that identifies specific measure to control on-site and off-site erosion compliant with the City's Municipal Code. Compliance with SC HYD-1 through SC HYD-3, in addition to the implementation of the stormwater drainage system, would ensure Project operational activities would not violate any water quality standards or otherwise substantially degrade surface or groundwater quality. Therefore, impacts would be less than significant, and no mitigation is required.

Threshold 4.9-2:	**Would the Project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?**
	Level of Significance: Less than Significant Impact

The project site is located within the Rialto-Colton water basin. The main recharge areas are Lytle Creek, Reche Canyon, and the Santa Ana River. Smaller amounts of recharge are achieved through percolation of precipitation, underflow, irrigation, and septic returns. The City uses groundwater from five underground basins as one of the main water supply sources, including the Rialto-Colton Subbasin.

The Project does not propose the use of wells or other groundwater extraction activities. As discussed in the Groundwater section of the Environmental Setting, there are multiple agencies and mechanisms in place that regulate the water levels of the Rialto-Colton Subbasin, and restrictions on what entities can extract water from it. Therefore, although the Project would potentially use water that is extracted from the Subbasin, there is a system in place to prevent the Rialto-Colton Subbasin from being over pumped or not having adequate sources of recharge. Therefore, there is no potential to decrease groundwater supplies. Although the proposed Project would result in additional impervious surfaces on-site, the proposed Project would construct an underground filtration basin system which would detain, infiltrate and treat water prior to discharging into the public storm drain system. Larger sediment and debris are removed using hydrodynamic separators in a pre-treatment unit. Remaining pollutants of concern will be treated using infiltration into the soil below. The pre-treatment and filtration minimize pollutants from entering groundwater. According to the Urban Water Management Plan, small amounts of water percolate downwards into the soil as large sources of recharge are creeks and rivers. Due to the small size of the project site in comparison to the 40-square-mile Rialto-Colton groundwater basin and drainage design features provided through the PWQMP, the proposed Project would not significantly impact local groundwater recharge or impede sustainable groundwater management of the basin. A less than significant impact would occur and no mitigation is required.

Threshold 4.9-3i:	**Would the Project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would result in substantial erosion or siltation on- or off-site?**
	Level of Significance: Less than Significant Impact

The project site is undeveloped and vacant. Therefore, development would alter the site's existing drainage pattern through the increase of new impervious surfaces. There is currently no stream or river traversing the project site. The Project would include the installation of underground basins to capture and treat on-site stormwater runoff. The series of basins would detain, infiltrate, and treat water within the site. Stormwater runoff that discharges to Locust Avenue is only in an emergency overflow event. Emergency overflow condition means a situation where the storm event would exceed the 100-year design.

Pursuant to Municipal Code Section 17.40.010, the Project must prepare an erosion control plan to identify specific measures to control on-site and off-site erosion throughout the duration of construction. Furthermore, the Project must ensure compliance with the SCAQMD Rule 403 to minimize water- and windborne erosion. As required and outlined in SC HYD-1 and SC HYD-2, the Project must obtain a Construction General Permit which would require the preparation of a SWPPP that includes erosion control and sediment control BMPs and the preparation of a SWQMP identifying BMPs to control stormwater and non-stormwater pollutants. Additionally, SC HYD-3 discusses the preparation of an Erosion Control Plan that identifies specific measure to control on-site and off-site erosion compliant with the City's Municipal Code. As such, these standard conditions would ensure potential impacts associated with Project implementation related to erosion or siltation would be less than significant and no mitigation would be required.

Threshold 4.9-3ii:	**Would the Project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?**
Impact 4.9-3iii:	**Would the Project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?**
Impact 4.9-3iv:	**Would the Project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would impede or redirect flood flows?**
	Level of Significance: Less than Significant Impact

Project implementation would construct a new warehouse and introduce impervious surfaces, which could increase surface runoff on the site compared to existing conditions. These proposed changes may impact infiltration rates, drainage patterns, and the rate and amount of stormwater runoff.

Revised: The Project's on-site storm drain system is designed to capture all stormwater runoff through a series of inlets that convey that water to underground pipes, leading to three on-site underground basins for infiltration and detention. Project outflows would only be released to Locust Avenue in an emergency overflow condition. The proposed underground basins are sized for the design capture volume (DCV) required to retain, detain, or slowly release flood volumes associated with the 100-year and 3-, 6-, and 24-hour storm events. During high storm events, overflows would be routed from the underground basins to a concrete flume that would discharge to the southeast corner of the site on Locust Avenue. If the captured flows exceed the above ground basin capacity, an emergency spillway concrete flume would direct flows toward the public right-of-way on Locust Avenue.

The project site is divided into three drainage management areas (DMAs). Generally, DMA 1 totals 22.87 acres and covers the northern portion of the site, truck docking area, and south side of the site. DMA 2 totals 7.36 acres and covers the western portion of the warehouse. DMA 3 totals 9.53 acres and covers the truck trailer storage parking lot, see Table 4-2 in **Appendix H1**. DMA 1 contains the underground basin within the truck dock area. DMA 2 contains the underground basin located within the private drive west of the warehouse building. DMA 3 would contain the underground basin at the truck trailer storage parking lot. The Project would detain the 100-year peak volume by underground storage. As a result, all DMAs have been designed to capture 100-year storm event flows. The stormwater infrastructure system designed for the Project is depicted in the Preliminary Drainage Report (**Appendix H1, Proposed Drainage Exhibit**).

As noted above, the stormwater runoff from the project site would be captured and directed toward stormwater drainage facilities. Therefore, implementation of the Project would not create or contribute runoff that would exceed the capacity of existing stormwater drainage facilities. The Project would adhere to SC HYD-2 which requires BMPs that would ensure that construction and operational activities would

not result in substantial amounts of pollutant runoff, evidenced by the creation of a drainage plan that incorporates filtration, retention, and detention. Therefore, impacts would be less than significant.

According to FEMA FIRM, the project site is in panel 06071C7920H (effective August 27, 2008). No part of the project site is within a FEMA-mapped special flood hazard area and the project site is classified as Zone X; an area noted as having minimal flood hazard. Thus, the project site is not expected to be inundated by flood flows during the lifetime of the Project and Project implementation would not impede or redirect flood flows. Therefore, impacts would be less than significant, and no mitigation is required.

Impact 4.9-4:	**In flood hazard, tsunami, or seiche zones, would the Project risk release of pollutants due to project inundation?** ***Level of Significance:*** Less than Significant Impact

According to FEMA FIRM, the project site is not located within a flood hazard zone. The Pacific Ocean is over 45 miles southwest of the project site; as a result, the site will not be impacted by a tsunami. There are no large bodies of water near the project site. Therefore, the proposed Project is not within a zone with risk of seiche or tsunami. Further, as outlined in SC HYD-1 and SC HYD-2, the Storm Water Quality Management Plan (SWQMP) and SWPPP for the proposed Project would limit pollution rates from stormwater conveyance. Overall, the Project is not located in a flood hazard, tsunami, or seiche zone, and following compliance with standard conditions outlined in SC HYD-1 and SC HYD-2, would not risk release of pollutants due to project inundation. Thus, impacts would be less than significant, and no mitigation is required.

Impact 4.9-5:	**Would the Project conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?** ***Level of Significance:*** Less than Significant Impact

As discussed under Threshold 4.9-1, the Project would comply with water quality standards and provisions. In 2014, the State adopted the California Sustainable Groundwater Management Act, which provides authority for agencies to develop and implement groundwater sustainability plans or alternative plans that demonstrate the sustainable management of water basins.

The project site is located within the Rialto-Colton Subbasin which is adjudicated under the Western-San Bernadino Judgement. Adjudicated basins are exempt from the Sustainable Groundwater Management Act because they operate under a separate management plan. The Rialto-Colton Subbasin operates under the San Bernadino Valley Municipal Water District, an entity that regulates groundwater extraction and recharge. The Project does not include activities related to groundwater extraction, and water supplied to the project site during construction and operations is regulated under a sustainable groundwater management plan created by the Rialto-Colton Basin Groundwater Council. Three different apparatuses exist to ensure that overdraft does not occur; a further analysis of the projected water consumption relative to available water supply sources for the project site is discussed in **Section 4.17: Utilities and Service Systems**. The water demand of projected development is discussed in the IRUWMP such that water consumption for the project site would be accounted for in the plan. Additionally, the Project does not include any activities related to groundwater extraction. Therefore, no component of the Project would be in opposition to the management plan for the Rialto-Colton Subbasin. Further, pursuant to

Municipal Code Section 12.60.260 and outlined in SC HYD-2, the Project would be required to prepare and implement a SWQMP that identifies BMPs related to stormwater quality. As such, the Project's construction and operation would not conflict with any water quality control plan or sustainable groundwater management plan. Therefore, impacts would be less than significant, and no mitigation is required.

4.9.7 Cumulative Impacts

Water Quality

Similar to the proposed Project, cumulative projects in the City would be required to comply with water quality control measures within the NPDES General Construction Permit that requires implementation of a SWPPP, WQMP, and BMPs that help reduce impacts of pollutants on water quality. The NPDES Permit is mandated by the State and specific guidelines are established by the Santa Ana RWQCB to reduce effects of local projects. Compliance with all relevant local, regional, and state water quality control guidelines listed above would reduce cumulative impacts to less than significant. As a result, the proposed Project would not generate impacts related to the water quality and thus would not make a cumulatively considerable contribution to significant cumulative impacts on water quality. Therefore, cumulative impacts related to water quality would be less than significant and no mitigation is required.

Drainage Alteration

The Project and other cumulative projects considered in the cumulative analysis would not create a significant cumulative impact when added together. Projects must comply with State and local regulations concerning stormwater runoff and treatment. These regulations ensure that significant cumulative impacts would not occur.

As noted above, the Project would result in an increase in impervious surfaces, therefore potentially altering drainage patterns and increasing stormwater runoff. However, the Project would include installation of a drainage network, consisting of three underground basins to detain, retain, and filtrate stormwater runoff. The stormwater system is designed to capture the 100-year flood event and would treat flows through infiltration. As a result, the proposed Project would not generate runoff significant enough that it would create a significant cumulative impact concerning drainage, erosion, siltation, flooding, or pollutant release due to inundation when combined with runoff from other projects. Therefore, cumulative impacts related to drainage would be less than significant and no mitigation is required.

Groundwater Basin: Groundwater Supply and Groundwater Management Plans

The cumulative projects within the Santa Ana Watershed would be required to comply with the State and regional water board requirements for protection of groundwater resources. The Project would not result in a cumulatively considerable decrease in groundwater supplies or interfere substantially with groundwater supplies or recharge. Project activities would not extract groundwater during construction or operations. Furthermore, the Project's water demand has already been accounted for in the General Plan's land use designation that estimated the proposed water usage of future development within the City. As a result, the proposed Project would not generate impacts related to the groundwater basin and thus would not make a cumulatively considerable contribution to significant cumulative impacts on the groundwater basin. Therefore, cumulative impacts related to the groundwater basin would be less than significant and no mitigation is required.

4.9.8 Mitigation Program

Standard Conditions

SC HYD-1: The Applicant or his/her designees shall obtain a General Permit for Stormwater Discharge Associated with Construction Activity (Construction Activity General Permit). The Applicant or his/her designees shall provide a copy of this permit to the City Public Works Department prior to the issuance of the first grading permit.

SC HYD-2: Prior to issuance of the first grading permit, the Applicant shall submit to the City Engineer for approval, a Storm Water Quality Management Plan (SWQMP) specifically identifying Best Management Practices (BMPs) that will be incorporated into the Project to control stormwater and non-stormwater pollutants during and after construction. To ensure compliance, a legal and fiduciary enforcement mechanism in the form of a Storm Water Quality Management Plan Agreement shall be executed with the City of Rialto. This agreement shall additionally be recorded in the office of the County Recorder for the County of San Bernardino. The SWQMP shall specify BMPs specific to the project site, which shall be integrated into the stormwater conveyance plan. The plan shall identify specific strategies, including the following.

- Site design features, including maximizing open space, preservation of natural drainages, and minimization of impervious surfaces.
- Source control features, including leveraging public outreach and education, use of appropriate landscaping, and covering trash storage areas.
- Treatment controls, including the use of underground chambers.

SC HYD-3: An Erosion Control Plan shall be prepared, and included with the Project's grading plan, and implemented for the Project that identifies specific measures to control on-site and off-site erosion from the time ground disturbing activities are initiated through completion of grading. The Erosion Control Plan shall include the following measures at a minimum:

- Specify the timing of grading and construction to minimize soil exposure to rainy periods experienced in Southern California; and
- An inspection and maintenance program shall be included to ensure that any erosion which does occur either on-site or off-site as a result of this Project will be corrected through a remediation or restoration program within a specified time frame.

Mitigation Measures

No mitigation is required.

4.9.9 Level of Significance After Mitigation

Compliance with the standard conditions set forth in this section would reduce potential impacts to a level considered less than significant. No mitigation is required.

4.10 LAND USE AND PLANNING

This section of the EIR describes the land use conditions for the project site and discusses potential land use impacts that could result from implementation of the proposed Project. The pre-development condition of the project site and surrounding area was used as the baseline with which to compare potential impacts associated with the Project.

4.10.1 Regulatory Setting

State Regulations

California State Planning and Zoning Law

The legal framework in which California cities and counties exercise local planning and land use functions is set forth in the California Planning and Zoning Law Sections 65000 to 66499.58. State law delegate most of the State's local land use and development decisions to cities and counties and describes laws pertaining to the regulation of land uses by local governments, including subdivisions and zoning. Each city and county must adopt a comprehensive, long-term general plan; there are fundamental requirements that must be met. These requirements include the inclusion of seven mandatory elements described in the Government Code, including a section on land use. Each of the elements must contain text and descriptions setting forth objectives, principles, standards, policies, and plan proposals; diagrams and maps that incorporate data and analysis; and mitigation measures.

Senate Bill 375

Senate Bill (SB) 375, approved by then Governor Schwarzenegger in 2008, is intended to address climate change by promoting sustainable land use and transportation planning by reducing vehicle miles traveled (VMT) and promoting more sustainable and efficient transportation systems within California. The bill requires regional agencies to develop and implement a Sustainable Communities Strategy (SCS) as part of their regional transportation plans. The purpose of the SCS is to reduce greenhouse gas emissions (GHG), promote compact development, and increase transportation options. SB 375 encourages collaboration between local governments, transportation agencies, and other stakeholders to achieve these goals.

Regional Regulations

Southern California Association of Governments

Southern California Association of Governments (SCAG) is a council of governments representing San Bernardino, Los Angeles, Orange, Riverside, Ventura, and Imperial counties. SCAG is the federally recognized Metropolitan Planning Organization (MPO) for this region. SCAG is a regional planning agency and a forum for addressing regional issues concerning transportation, the economy, community development, and the environment. SCAG is also the regional clearinghouse for projects requiring environmental documentation under federal and State law. In this role, SCAG reviews proposed development and infrastructure projects to analyze their impacts on regional planning programs. As the Southern California region's MPO, SCAG cooperates with the South Coast Air Quality Management District (SCAQMD), California Department of Transportation (Caltrans), and other agencies in preparing regional planning documents. SCAG has developed the Regional Housing Needs Assessment and the Regional Transportation Plan/Sustainability Communities Strategy (RTP/SCS or Connect SoCal).

SCAG 2024-2050 Regional Transportation Plan/Sustainable Communities Strategy (Connect SoCal)

On April 4, 2024, SCAG's Regional Council adopted the *2024-2050 Regional Transportation Plan/Sustainable Communities Strategy* [RTP/SCS] or Connect SoCal. The RTP/SCS charts a course for closely integrating land use and transportation so that the region can grow smartly and sustainably. The strategy was prepared through a collaborative, continuous, and comprehensive process with input from local governments, county transportation commissions, tribal governments, non-profit organizations, businesses and local stakeholders within the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. The RTP/SCS is a long-range vision plan that balances future mobility and housing needs with economic, environmental, and public health goals. The SCAG region strives toward sustainability through integrated land use and transportation planning. The SCAG region must achieve specific federal air quality standards and is required by state law to lower regional GHG emissions.

SCAG Intergovernmental Review Program

SCAG's Intergovernmental Review Program provides informational resources to regionally significant plans, projects, and programs per CEQA Guidelines Section 15206: Projects of Statewide, Regional, or Areawide Significance,[1] to facilitate review for these projects' consistency with SCAG's adopted regional plans, to be determined by the lead agencies. Informational resources include regional goals and policies, and jurisdictional-level growth forecasts and mitigation measures.

Local Regulations

Rialto General Plan

The City of Rialto General Plan (General Plan) is the comprehensive planning document governing development in the City, and contains goals, policies, and actions describing the community's vision for economic viability, livable neighborhoods, and environmental protection. The General Plan establishes land use designations for land in the City and policies for the orderly growth and development of the City. Among other purposes, the General Plan identifies policies necessary to protect and enhance those features and services which contribute to the quality of life of the community in which it serves.

The General Plan contains the following chapters related to state-mandated elements required for a General Plan: Managing Our Land Supply; Investing in Our Future; Making the Connections: the Circulation Chapter; Safety and Noise; Housing Element; Our Roots: Cultural and Historic Preservation; and Implementation Plan, which are described below. The General Plan Land Use Plan Map visually represents the physical relationship of all portions of the text, including development densities. The City of Rialto prepared a Focused General Plan Update (2024) to the Land Use Element, Safety Element, and Circulation Element. Additionally, the City prepared a General Plan Environmental Justice Element. These General Plan elements were adopted by the City on December 10, 2024.

Chapter 2: Managing Our Land Supply. The Managing Our Land Supply Chapter combines the elements of Land Use, Community Design, Open Space, and Conservation. Its purpose is to guide long-term physical changes while providing and conserving community and natural resources. The chapter establishes the City's preferred land use patterns, guides the visual character of public places and private development, and creates conservation and protection plans for natural resources and open space. Its primary goal is to

[1] The Lead Agency shall determine that a proposed project is of statewide, regional, or areawide significance if the project meets various criteria, including "A proposed local general plan, element, or amendment thereof for which an EIR was prepared" (CEQA Guidelines § 15206(b)(1)).

direct the use of the City's land resources in an equitable and productive manner to enhance the quality of life for residents and the overall community.

Chapter 3: Investing In Our Future. The Investing In Our Future Chapter discusses the economic development, redevelopment, and infrastructure plans. With the goals and policies set forth in this Chapter, the City aims to address the economic needs of the community, focus on redevelopment of project areas within the City, and maintain reliable public utility infrastructure.

Chapter 4: Making the Connections: Circulation Element. The Circulation Element is a required part of the General Plan and is designed to guide the development of the City's transportation system in line with the land use plan. Its purpose is to ensure that major roadways, transportation routes, and public utilities are coordinated with land use. The Circulation Element considers the increasing demand for travel due to development and the growth of its logistics industry. It aims to create a system of Complete Streets that accommodates the needs of all users including pedestrians, cyclists, motorists, and public transportation users.

Chapter 5: Safety and Noise Chapter. The City takes a proactive approach to planning by addressing hazards that may pose a threat to property and lives. These hazards include seismic and geologic hazards, flood hazards, fire hazards, hazardous materials, gangs, emergency response, and wind hazards. Although the City cannot prevent these hazards, it aims to minimize their effects through the goals and policies included in this chapter. Additionally, by addressing issues such as crime and hazardous materials use, Rialto can better respond to emergency situations and protect the community.

Chapter 6: Housing Element. The Housing Element is a required element of the General Plan. The City is currently under its sixth cycle Housing Element 2021 – 2029. The Housing Element serves as a comprehensive and coordinated strategy for promoting the development of safe, decent, and affordable housing for all members of the community.

Chapter 7: Our Roots: Cultural and Historic Resources. The City recognizes the significance of its cultural and historical resources in shaping its identity and development. Through the goals and policies provided within this Chapter, the City aims is to provide direction for preserving the City’s cultural and historic resources.

Chapter 8: Implementation Plan. The Implementation Plan serves as a guide for City officials, staff, and the public to implement the goals and policies outlined in the General Plan. It translates the general terms of the General Plan into specific actions and measures. These measures can be existing processes or new programs that require City action and may be subject to funding availability. The measures are organized by General Plan element and are intended to be used for the Annual Report on the City's progress in implementing the General Plan.

Chapter 9: Environmental Justice. Generally, environmental justice is defined as the basic right of people to live, work, go to school, play, and pray in a healthy and clean environment. Those in neighborhoods of lower income are more likely to be at a disadvantage when it comes to equal access to programs and places that make and keep us healthy. The Environmental Justice Element seeks to remedy this imbalance through goal and policies from six key environmental justice issues as outlined in Senate Bill (SB) 1000: community engagement, pollution exposure, access to public facilities, access to healthy food, safe and sanitary housing, and physical activity. The purpose of this element is to ensure that the City of Rialto is a

safe and healthy place with opportunities for everyone and to focus on goals that will improve communities and reduce inequities.

Rialto Airport Specific Plan

The Rialto Municipal Airport ceased operations in 2014 and the former airport property and much of the properties adjacent to the Rialto Municipal Airport that were suited to accommodate development were removed from the Rialto Airport Specific Plan and incorporated into the Renaissance Specific Plan, which was adopted by the City in 2010. Although the Rialto Municipal Airport is no longer operational, the City's Rialto Airport Specific Plan serves as the zoning ordinance for parcels in the Airport Specific Plan area that were not removed from the Airport Specific Plan, primarily located northwest, west, and east of the former Rialto Municipal Airport. The Airport Specific Plan provides a framework to guide future land use and development decisions in the Airport Specific Plan area. For projects within the Airport Specific Plan area, policies and standards in the Airport Specific Plan will take precedence over more general policies and standards applied throughout the rest of the City.

City of Rialto Municipal Code

Rialto Municipal Code Title 17. Rialto Municipal Code Title 17 functions as the City's subdivision regulations pursuant to the Subdivision Map Act (Government Code §§ 66400 through 66499.85). This Title contains requirements pertaining to required dedications and improvements, lot subdivision and merging, and associated fees. All subdivisions and lot merges within the City must comply with provisions within this Title.

Rialto Municipal Code Title 18. Rialto Municipal Code Title 18 functions as the City's Zoning Ordinance, which, in coordination with the City's specific plans, identifies the permitted land uses on all parcels in the City through assigned land use designations and associated land use regulations and development standards. In coordination with the Rialto General Plan and the Rialto Airport Specific Plan, Title 18 presents guidelines to promote appropriate land use and City design and designed to:

- lessen congestion in the streets;
- secure safety from fire, panic and other dangers;
- promote health and the general welfare;
- provide adequate light and air;
- prevent the overcrowding of land;
- avoid undue concentration of population; and
- facilitate the adequate provision of transportation, water, sewerage, schools, parks, and other public requirements.

4.10.2 Existing Conditions

Existing and Surrounding Land Uses

The project site is approximately 40 acres located at the southwest corner Locust Avenue and Lowell Street. The project site is vacant with the exception of remnants of a World War II-era bunker structure and rail spurs in the southern portion of the project site and an underground transformer on the northwestern portion of the project site along Lowell Street. The project site was vacant land until the 1940s when it was developed with rail spurs and bunkers used by the U.S. Army for the storage of weapons

and ammunition until the 1960s. Since that time, the project site has been generally vacant with areas used for stockpiling and storage activities. Currently, the majority of the site is covered with chaparral plant communities and non-native grassland.

The project site is located north of State Route 210 (SR-210) in an area of the City comprised primarily of industrial, warehouse, manufacturing and office uses with single-family residences approximately 700 feet east of Locust Avenue and the Mid-Valley Landfill to the west. Additionally, adjacent to the project site, east of Locust Avenue is an undeveloped parcel, and adjacent to the project site west of Lake Padden Lane is Robertson's Ready Mix.

General Plan and Zoning Designations

General Plan. The project site has a General Plan land use designation of General Industrial. The General Industrial designation allows for a broad range of heavy industrial activities requiring large areas of land with convenient access for trucks and rail. Permitted uses include manufacturing and processing, warehousing and distribution, chemical or petroleum products processing and refining, heavy equipment operations, and similar uses.[2] The maximum Floor to Area Ratio (FAR) for this land use designation is 1.0.

Specific Plan/Zoning. The project site is zoned Rialto Airport Specific Plan and has a Specific Plan land use designation of General Manufacturing (I-GM). Table 8 of the Rialto Airport Specific Plan identifies permitted uses within the I-GM zone including manufacturing and processing, warehousing and distribution, chemical or petroleum products processing and refining, heavy equipment operations, and similar uses.[3]

4.10.3 Methodology

The pre-development conditions of the project site and surrounding area are used as the baseline to compare potential impacts associated with the Project. The analysis of the project site is based on the conditions of the site when the Notice of Preparation (NOP) was published. The proposed Project is evaluated against the significance criteria below, as the basis for determining the level of impacts related to land use and planning. This analysis considers existing regulations, laws and standards that serve to avoid or reduce potential environmental impacts. Where significant impacts remain, despite compliance with regulatory framework, feasible mitigation measures are recommended, where warranted, or reduce the Project's potentially significant environmental impact.

4.10.4 Thresholds of Significance

The following significance criteria for land use and planning were derived from the Environmental Checklist in CEQA Guidelines, Appendix G. The proposed Project would result in a significant impact related to land use and planning if it would:

- Cause a significant environmental impact due to a conflict with any plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.

[2] City of Rialto. *Rialto General Plan Upda*te. Retrieved from: https://www.yourrialto.com/DocumentCenter/View/4457/2023-Land-Use-Element?bidId= Accessed September 25, 2024.

[3] City of Rialto. 1997. *Rialto Airport Specific Plan*. Table 8. Retrieved from https://www.rialtoca.gov/DocumentCenter/View/570/Rialto-Airport-Specific-Plan-PDF. Accessed October 23, 2024.

As addressed in **Section 5.1: Effects Found Not to be Significant**, the City has determined that the proposed Project would not have a significant impact on the following threshold for the reasons stated below, and that no further analysis was required in the EIR:

- Would the Project physically divide an established community.

The Project could have a significant environmental impact if it were sufficiently large or otherwise configured in such a way as to create a physical barrier or other physical division within an established community. For example, the construction of a highway through an existing community could constrain travel from one side of the community to another, as well as the cohesiveness of that community.

The proposed Project would develop a speculative warehouse building with three new driveways on Lowell Street, one driveway on Locust Avenue, and one emergency vehicle only driveway on Lake Padden Lane. As described above, the project site would be located in an area with predominantly planned and developed industrial, warehouse, manufacturing, and office uses. The project site is bordered by Lowell Street and industrial, office, and warehouse uses to the north; industrial uses, Locust Avenue, and an undeveloped parcel and single-family residences to the east; industrial, warehouse, and manufacturing uses to the south; and Lake Padden Lane, industrial and manufacturing uses, and Mid-Valley Landfill to the west. The residential neighborhood is approximately 700 feet east of Locust Avenue. The site does not currently provide any connection to the residential neighborhood nor does it provide connectivity or accessibility to other surrounding uses. The Project would include roadway and utility improvements along Lowell Street and Locust Avenue adjacent to the project site, including sidewalks, curbs, and utility connections. Project improvements would not include features such as a highway, new roadway, or above-ground infrastructure that would preclude or impede movement through the project site such that a permanent disruption in the physical arrangement of the surrounding community or isolation of that community would occur. The Project is consistent with the existing General Plan designation and zoning and would be compatible with the existing industrial uses adjacent to the site. As such, neither the residential neighborhood nor other existing or planned communities proximate to the project site would be physically divided by the proposed Project. Therefore, the proposed Project would not physically divide an established community and no impact would occur.

4.10.5 Project Impacts and Mitigation

Impact 4.10-1:	**Would the Project cause a significant environmental impact due to a conflict with any plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?** ***Level of Significance:*** Less than Significant Impact

Connect SoCal Goal Analysis

Project-relevant RTP/SCS policies for land use and planning are addressed below.

- Create human-centered communities in urban, suburban, and rural settings to increase mobility options and reduce travel distances.
- Improve access to jobs and educational resources.
- Advance a resilient and efficient goods movement system that supports the economic vitality of the region, attainment of clean air, and quality of life for our communities.

Consistent with Connect SoCal Goals, the project site is located near existing transit routes (i.e., OmniTrans route along Locust Avenue), access to I-210, and truck routes. The location of the Project within a developed area would place an employment center in close proximity to existing residential uses east of Locust Avenue. Locating an employment center near existing residential uses would potentially reduce trip lengths required for existing residents to travel to work, thereby reducing mobile emissions. Additionally, the Project would include pedestrian access to the project site (i.e., sidewalks) along Lowell Street and Locust Avenue to improve pedestrian mobility and safety. Further, the Project would implement MM AQ-4; refer to **Section 4.2: Air Quality**, which would require the preparation of Transportation Demand Management (TDM) strategies to reduce single-occupant auto travel and encourage alternate means of transportation. Project TDM strategies include pedestrian network improvements, traffic calming measures, implementation of a low-stress bicycle network, and implementation of ride-share programs. Additionally, implementation of the Project would result in the development of a warehouse on vacant land and provide additional employment opportunities which would support a healthy community. Therefore, the Project is consistent with applicable goals of the 2024-2050 RTP/SCS. Connect SoCal is discussed further in **Section 4.2: Air Quality**, **Section 4.5: Energy, Section 4.7: Greenhouse Gas Emissions, Section 4.12: Population and Housing,** and **Section 4.15: Transportation**, and similarly concludes the Project would not conflict with any other applicable goals of the 2024-2050 RTP/SCS in each respective section of this EIR. Therefore, the proposed Project would not result in a change in, or conflict with any Connect SoCal Goal that would result in potentially significant impact. Thus, impacts would be less than significant and no mitigation is required.

General Plan Consistency Analysis

General Plan goals and policies relevant to the Project are addressed in **Table 4.10-1: General Plan Consistency Analysis.** As indicated in the table, the Project would be consistent with applicable Rialto General Plan policies. Therefore, the proposed Project would not result in a change in, or conflict with any Rialto General Plan policy that would result in potentially significant impacts. Therefore, impacts would be less than significant and no mitigation is required.

Table 4.10-1: General Plan Consistency Analysis	
General Plan Policy	**Project Consistency**
Chapter 2: Managing Our Land Supply	
Goal 2-9: Residential areas, schools, parks, and other sensitive land uses are protected from the impacts associated with industrial and trucking-related land uses.	
Policy 2-9.1: Require mitigation and utilize other techniques to protect residential development and other sensitive land uses near industrial land uses or within identified health risk areas from excessive noise, hazardous materials and waste releases, toxic air pollutant concentrations, and other impacts.	**Consistent**. The nearest residential development is approximately 700 feet east of the project site and east of Locust Avenue. Project implementation would not result in significant impacts to sensitive land uses. As addressed in **Section 4.2: Air Quality**, MM AQ-1 and MM AQ-5 would minimize health risks to sensitive land uses by requiring the use of low VOC paints, electric appliances including landscaping equipment and cargo handling equipment, and incentives to support ride-share programs. As discussed in **Section 4.11: Noise** and **Section 4.8: Hazards and Hazardous Materials**, the Project would comply with existing federal, State, and local noise and hazardous material and waste handling regulations and therefore result in less than significant impact to sensitive land uses in the project area. Further, MM HAZ-1 would require the retainment of a munitions expert to monitor grading activities and ensure any unexploded ordnances and discarded military munitions encountered would not result in an adverse impact to nearby sensitive land uses. Therefore, the Project would comply with this General Plan policy.
Policy 2-9.2: Require all industrial development to front on an improved street with appropriate front yard setbacks, landscaping and façade and entrance treatments.	**Consistent**. The development regulations for industrial developments in the Rialto Airport Specific Plan area require a front setback of 25 feet and a minimum side and rear setback of zero (0) feet, as well as a 20-foot average minimum width of landscaping from the property line along public roadways. The Project would provide a front setback of approximately 237 feet along Lowell Street, a side setback of 197 feet on the east and 76 feet on the west, and a 110-foot rear setback. In addition, the Project would provide landscaping throughout the project site focused near parking lot areas and driveway entries, a 20-foot wide landscape buffer along the public roadways, and a total landscaped area of approximately 9.2 percent of the site. Therefore, the Project would comply with this General Plan policy.
Policy 2.9-5: Ensure that industrial land uses minimize conflict with surrounding incompatible uses through building design and truck restrictions.	**Consistent.** Adjacent land uses are limited to industrial, warehouse, and office uses. Truck access would be from Lowell Street onto Locust Avenue, and from Locust Avenue. Locust Avenue is a designated truck route in the City's General Plan. Therefore, the Project would comply with this General Plan policy.
Policy 2.9-6: Locate smaller buildings and less intensive uses within an industrial development site closer to adjacent residential uses, rather than large or more intensive uses.	**Consistent.** The nearest residential uses are approximately 700 feet east of the project site, which is east of Locust Avenue; Locust Avenue is a truck route. The Specific Plan development regulations require a minimum side setback of zero (0) feet. The Project's secured truck trailer parking lot would be set back from the property boundary along Locust Avenue by approximately 25.75 feet, the warehouse building would be set back from the property boundary adjacent to other industrial uses on the east by approximately 197 feet and from the property boundary on the west by approximately 76 feet. The proposed setbacks greatly exceed the Airport Specific Plan requirement. Therefore, the Project would comply with this General Plan policy.

Table 4.10-1: General Plan Consistency Analysis	
General Plan Policy	**Project Consistency**
Policy 2.9-7: Require warehousing and industrial uses to incorporate natural landscape materials (trees, shrubs, and hedges) to buffer differing land uses, and provide a transition between adjacent properties.	**Consistent.** As noted above and shown in **Figure 3-10**, landscaping would encompass approximately 9.2 percent of the project site and be focused along the perimeter, parking lot areas, and driveway entries. A mix of accent trees are proposed along public roadways, Locust Avenue and Lowell Street. Smaller understory landscaping including groundcover and accent shrubs would be layered beneath the trees. Landscaping along the public streets would screen truck trailers from the public right-of-way. Therefore, the Project would comply with this General Plan policy.
Policy 2.9-8: For sites with access to alleyways or other internal circulation routes, locate industrial loading docks away from public-facing streets to reduce trucking-related impacts in sensitive areas.	**Consistent.** Project loading docks would be located along the east side of the warehouse building. Public views of the loading area would be shielded due to existing development along Locust Avenue, as well as a 14-foot-high decorative screen wall along the northern boundary of the project site facing Lowell Street, along the eastern boundary of the project site facing Locust Avenue, and along the northeastern portion of the project site's southern boundary facing the existing industrial uses to the south. Therefore, the Project would comply with this General Plan policy.
Goal 2-12: Design streetscapes in Rialto to support and enhance the City's image as a desirable place to live, work, shop, and dine.	
Policy 2-12.1: Require the screening of commercial or industrial parking areas, storage yards, stockpiles, and other collections of equipment from the public right-of-way.	**Consistent**. The Project includes a variety of trees to screen both trailer and employee parking areas fronting Lowell Street and Locust Avenue (see **Figure 3-8**, **Figure 3-9**, and **Figure 3-10**). Additionally, see consistency with **Policy 2.9-8**. Therefore, the Project would comply with this General Plan policy.
Policy 2.12-5: Require that projects with perimeter walls (including gated residential communities) provide an interesting streetscape, with pedestrian access to major travel ways.	**Consistent.** See consistency with **Policy 2-12.1.** Additionally, the Project would include pedestrian access to the project site (i.e., sidewalks) along Lowell Street and Locust Avenue. Therefore, the Project would comply with this General Plan policy.
Goal 2-15: Protect scenic vistas and scenic resources.	
Policy 2-15.1: Protect views of the San Gabriel and San Bernardino Mountains by ensuring that building heights are consistent with the scale of surrounding, existing development.	**Consistent**. The San Gabriel Mountains are located approximately 3.5 miles to the northwest and the San Bernardino Mountains are located approximately 8 miles to the east. Rialto Airport Specific Plan I-GM zone has a maximum building height of 75 feet. The proposed Project would have a maximum building height of 55 feet finished grade. This is below the 75-foot maximum height allowed within the Rialto Airport Specific Plan I-GM zone and is comparable to the height of existing development in the area. As discussed in **Section 4.1: Aesthetics**, although Project implementation would result in the partial obstruction of designated scenic vistas, these views are currently obstructed by existing urban development. Therefore, the Project would comply with this General Plan policy.
Policy 2-15.2: Protect views of the La Loma Hills, Jurupa Hills, Box Spring Mountains, Moreno Valley, and Riverside by ensuring that building heights are consistent with the scale of surrounding, existing development.	**Consistent.** The La Loma Hills are located approximately 9 miles to the southeast, Jurupa Hills are approximately 8 miles southwest, Box Springs Mountains are approximately 14 miles to the southeast, the City of Moreno Valley is approximately 16 miles to the southeast, and the City of Riverside is approximately 10 miles to the southeast. Rialto Airport Specific Plan I-GM zone has a maximum building height of 75 feet. The proposed Project would have a maximum building height of 55 feet finished grade.

Table 4.10-1: General Plan Consistency Analysis	
General Plan Policy	**Project Consistency**
	This is below the 75-foot maximum height allowed within the Rialto Airport Specific Plan I-GM zone and is comparable to the height of existing development in the area. Therefore, the Project would comply with this General Plan policy.
Policy 2-15.3: Ensure use of building materials that do not produce glare, such as polished metals or reflective windows.	**Consistent.** The Project would be required to comply with CCR Title 24 standards which would require all glass used in the building design to have minimal reflectivity to reduce glare to surrounding neighbors. The proposed building would not use highly reflective materials, such as large expanses of reflective glass. Therefore, the Project would comply with this General Plan policy.
Goal 2-17: Improve the architectural and design quality of development in Rialto.	
Policy 2-17.1: Require new development and construction to exhibit a high level of quality architectural design to emphasize community uniqueness, individuality, and historical references.	**Consistent.** The conceptual design for the Project includes concrete tilt-up panels with architectural treatments, such as panel reveals to provide visual relief of the building facades. As shown in **Figure 3-6** through **Figure 3-8**, the exterior elevations would be white and grey with blue accents and blue window glazing. Therefore, the Project would comply with this General Plan policy.
Policy 2–17.5: Require developers to vary building and parking setbacks along the streetscape to create visual interest.	**Consistent.** See consistency with **Policy 2-9.2.**
Policy 2–17.6: Require architectural treatments on all façades facing rights-of-way, public streets, and alleys, including windows, doors, architectural details, and landscape treatment.	**Consistent.** The proposed warehouse exterior elevations would be white and grey with blue accents and blue window glazing with concrete tilt-up panels with architectural treatments, such as panel reveals to provide visual relief of the building facades. Landscaping would be focused around the site perimeters, parking areas, driveway entrances, and building entrances for aesthetic affect. Therefore, the Project would comply with this General Plan policy.
Goal 2-18: Provide high-quality and environmentally sustainable landscaping.	
Policy 2-18.1: Require the planting of street trees along public streets and inclusion of trees and landscaping for private developments to improve airshed, minimize urban heat island effect, and lessen impacts of high winds.	**Consistent.** The Project would include approximately 3.7 acres of landscaping throughout the project site. The proposed landscaping would include the planting of various trees along the Project's frontage on Locust Avenue, Lowell Street, and Lake Padden Lane and within the passenger vehicle parking area. Therefore, the Project would comply with this General Plan policy.
Policy 2-18.3: Require the use of drought-tolerant, native landscaping and smart irrigation systems for new development to lower overall water usage.	**Consistent.** Landscaping would be included throughout the project site to retain runoff. The proposed landscaping would include native plant species. The proposed drainage improvements would include a modular wetland unit to improve water quality of runoff. Therefore, the Project would comply with this General Plan policy.

Table 4.10-1: General Plan Consistency Analysis	
General Plan Policy	**Project Consistency**
Goal 2-23: Promote commercial and/or industrial development that is well designed, people-oriented, environmentally sustainable, sensitive to the needs of the visitor or resident, and functionally efficient for its purpose.	
Policy 2–23.1: Require that developments incorporate varied planes and textures and variety in window and door treatments on building façades.	**Consistent.** See consistency with **Policy 2-17.1.**
Policy 2-23.2: Encourage architecture that disaggregates massive buildings into smaller parts with greater human scale.	**Consistent.** The Project would comply by developing the proposed building with facades that would use color variation, glazing, and vertical articulation to allow for variation in mass and scale. The proposed warehouse would be approximately 55 feet in height from finished grade; materials used would include wall panels, concrete, galvalume metal roofing, and a glass curtain wall as well as various colors to reduce the overall sense of perceived mass. As discussed in **Section 4.1: Aesthetics**, the Project would not result in significant visual impacts. Therefore, the Project would comply with this General Plan policy.
Policy 2-23.3: Require that landscaping be incorporated into commercial and industrial projects to define and emphasize entrances, inclusive of those areas along the front of a building facing a parking lot.	**Consistent.** The Project would provide an average width of 20 feet of landscaping from and along Locust Avenue and Lowell Street, meeting the minimum 20-foot depth requirement on public roadways (see **Figure 3-10**). Additionally, the Project would include landscape plantings along the site perimeter and parking areas for enhanced landscape screening. Therefore, the Project would comply with this General Plan policy.
Policy 2-23.5: Require developments to provide pedestrian and vehicle connections and pathways between parking lots at the rear and front of buildings.	**Consistent.** The Project proposes a sidewalk along the project site frontage of Locust Avenue and Lowell Street and pedestrian crossings at the driveways. The Project proposed three new driveways on Lowell Street, one driveway on Locust Avenue, and one emergency vehicle only driveway on Lake Padden Lane. Project site circulation for passenger vehicles would include drive aisles along the northern, western, and southern warehouse perimeter providing access to the employee/visitor parking area. All Project driveways would be 40 feet wide to allow for adequate turning movements for trucks and emergency vehicles. Internal to the site, a pedestrian walkway is proposed from the employee/visitor parking lot along Lowell Street, south toward the warehouse building. Therefore, the Project would comply with this General Plan policy.
Policy 2-23.6: Require delivery areas to be separated from pedestrian areas.	**Consistent.** The trailer parking and dock loading areas would be located on the eastern side of the warehouse and would be gated to separate pedestrian and loading areas (see **Figure 3-3**). Therefore, the Project would comply with this General Plan policy.
Policy 2-23.8: Insist that full architectural treatments and details be provided on all facades visible to the street of development projects.	**Consistent.** See consistency analysis for **Policy 2-17.1**.

Table 4.10-1: General Plan Consistency Analysis	
General Plan Policy	**Project Consistency**
Goal 2-24: Minimize the visual impact of parking lots	
Policy 2-24.1: Require mature trees and landscaping in off-street parking areas to make them more inviting and aesthetically appealing, and to provide sufficient shading to reduce heat.	**Consistent.** The Project includes a variety of trees to screen parking areas and provide shade within the project site (see **Figure 3-10**). Specifically, pursuant to Rialto Municipal Code Chapter 18.58.030, 74 trees would be planted throughout the parking areas to reduce heat and provide shade. See **Policy 2-23.3** analysis for further detail. Therefore, the Project would comply with this General Plan policy.
Policy 2-24.2: Encourage the inclusion of textured paving along pedestrian walkways and under building canopies.	**Consistent.** The Project would provide textured pedestrian walkways across the proposed driveways (**Figure 3-3)**. Additionally, the internal pedestrian walkway to the warehouse building entrance would be concrete with a medium broom finish. Therefore, the Project would comply with this General Plan policy.
Policy 2-24.3: Require use of drainage improvements designed, with native vegetation where possible, to retain or detain water runoff and minimize pollutants into drainage system.	**Consistent.** As discussed under consistency to **Policy 2-18.3**, **l**andscaping would be included throughout the project site to retain runoff. The Project proposes a network of underground piping and conveyance to three on-site underground infiltration basins. These basins would serve as a water quality best management practice which would treat storm water runoff on site before release. Therefore, the Project would comply with this General Plan policy.
Goal 2-29: Protect and enhance Rialto's surface waters and groundwater basins.	
Policy 2-29.3: Design sidewalks, roads, and driveways to minimize impervious surfaces; provide flood control channels with permeable bottoms to help restore groundwater aquifers.	**Consistent.** The project site would include approximately 160,491 sf of landscaping (9.2% of the project site). The remainder of the project site would be pervious, which would include pedestrian walkways, driveways, and surface parking. The proposed driveways and sidewalks would be designed in accordance with City code. Therefore, the Project would comply with this General Plan policy.
Policy 2–29.5: Apply methodologies and assign responsibility to protect the quality of groundwater from pollution by landfills and industrial uses.	**Consistent.** See consistency analysis for **Policy 2-24.3**. As discussed in **Section 4.8: Hydrology and Water Quality**, to protect the City's surface waters and groundwater basins, the Project has prepared a project-specific Storm Water Pollution Prevention Plan (SWPPP) and Water Quality Management Plan (WQMP). Both the SWPPP and WQMP would include measures to protect water quality during Project construction and operation. Therefore, the Project would comply with this General Plan policy.
Goal 2-30: Conserve water resources.	
Policy 2-30.1: Require new development to use features, equipment, technology, landscaping, and other methods to reduce water consumption.	**Consistent.** Landscaping would be included throughout the project site and would use an automatic irrigation system and appropriate use and grouping of native plants to foster long-term landscape water conservation. The proposed industrial use would require minimal water consumption during operation. Therefore, the Project would comply with this General Plan policy.
Goal 2-31: Incorporate green building and other sustainable building practices into development projects.	
Policy 2-31.1: Explore and adopt the use of green building standards and Leadership in Energy and Environmental Design (LEED) or similar in both private and public projects.	**Consistent.** The Project would comply with applicable California Green Building Standards (CALGreen) Code (24 CCR, Part 11), which includes requirements for water efficiency, construction waste reduction,

Table 4.10-1: General Plan Consistency Analysis	
General Plan Policy	**Project Consistency**
	recycling, and electrical vehicle facilitation. Therefore, the Project would comply with this General Plan policy.
Policy 2-31.2: Promote sustainable building practices that go beyond the requirements of Title 24 of the California Administrative Code, and encourage energy-efficient design elements, as appropriate.	**Consistent.** The Project would comply with Parts 6 and 11 of Title 24. The Project would have: (a) sensor-based lighting controls— for fixtures located near windows, the lighting would be adjusted by taking advantage of available natural light; and (b) efficient process equipment—improved technology offers significant savings through more efficient processing equipment. Additionally, the warehouse building would be designed to have 15% of the roof area solar-ready, in accordance with Title 24 standards. Therefore, the Project would comply with this General Plan policy.
Policy 2-31.3: Support sustainable building practices that integrate building materials and methods that promote environmental quality, economic vitality, and social benefit through the design, construction, and operation of the built environment.	**Consistent.** The Project would comply with regulatory requirements to divert at least 50 percent of construction and demolition waste from landfills; (b) mandatory inspections of energy systems to ensure optimal working efficiency; (c) low pollutant emitting exterior and interior finish materials, such as paints, carpets, vinyl flooring and particle boards; and (d) a 20% reduction in indoor water use. Therefore, the Project would comply with this General Plan policy.
Goal 2-32: Conserve energy resources.	
Policy 2-32.1: Require the incorporation of energy conservation features into the design of all new construction and site development activities.	**Consistent.** See consistency with **Policy 2-31.2.**
Goal 2-32: Balance the provisions of the California Surface Mining and Reclamation Act with City objectives to minimize negative impacts of mining activities on the Rialto community.	
Policy 2-33.4: Establish buffer zones of compatible uses adjacent to mineral extraction areas. Such uses may include industry. Require planting or other visual buffers to screen mining machines, stockpiles, vehicles, and other mining related facilities from visible residential areas.	**Consistent.** The Project is a compatible use with existing development in the area and is consistent with existing General Industrial land use designation and I-GM zoning. The Project also includes a 14-foot-high decorative screen wall, retaining walls and fencing, and landscape buffers which would provide screening and a visual buffer between the project site and the adjacent concrete mining operations to the south and east. Therefore, the Project would comply with this General Plan policy.
Goal 2-35: Achieve waste recycling levels that meet or exceed State mandates. Achieve maximum waste recycling in all sectors of the community: residential, commercial, industrial, institutional, and construction.	
Policy 2-35.2: Utilize source reduction, recycling, and other appropriate measures to reduce the amount of solid waste generated in Rialto that is disposed of in landfills.	**Consistent.** The Project would include measures to recycle during construction and operation when feasible. Please also see the response to **Policy 2-31.3.** Therefore, the Project would comply with this General Plan policy.
Policy 2-35.3: Encourage the maximum diversion from landfills of construction and demolition materials through recycling and reuse programs.	**Consistent.** Please see the response to **Policy 2-31.3**.

Table 4.10-1: General Plan Consistency Analysis	
General Plan Policy	**Project Consistency**
Goal 2-36: Reduce air pollution emissions from both mobile and stationary sources in the City.	
Policy 2-36.2: Require that new development projects incorporate design features that encourage ridesharing, transit use, park and ride facilities, and bicycle and pedestrian circulation.	**Consistent.** The Project would include a sidewalk along the Project frontage on Lowell Street and Locust Avenue to provide pedestrian access to the project site. Bicycle facilities, including short-term bicycle racks would also be provided on the site to facilitate alternative modes of transportation and reduce vehicle emissions. Additionally, as outlined in **Section 4.2: Air Quality**, the Project would implement MM AQ-4, which would result in the development of a TDM Plan incorporating feasible trip reduction strategies that would encourage ridesharing, transit use, park and ride facilities, and bicycle and pedestrian circulation. Therefore, the Project would comply with this General Plan policy.
Policy 2-36.3: Establish a balanced land use pattern, and facilitate developments that provide jobs for City residents in order to reduce vehicle trips citywide.	**Consistent.** The proposed development would be consistent with the General Industrial land use designation for the project site. Additionally, the Project would bring employment opportunities that would contribute to the diversity of uses that serve the needs of the City. Therefore, the Project would comply with this General Plan policy.
Policy 2-36.4: Require new development and significant redevelopment proposals to incorporate sufficient design and operational controls to prevent release of noxious odors beyond the limits of the development site.	**Consistent.** The project site and surrounding parcels are zoned for industrial uses. The Project does not propose a land use type associated with significant odors, such as farming, chemical plants, landfills, etc. The nearest sensitive receptors are single-family residences located approximately 700 feet east of Locust Avenue, which serves as the project boundary for the site. Project operations would not result in a substantial amount of noxious odors beyond the limits of the project site. As discussed in **Section 4.2: Air Quality** and outlined in LOR AQ-1, the Project would comply with SCAQMD Rule 402, which prohibits discharge of air quality nuisances including those associated with odors. Therefore, the Project would comply with this General Plan policy.
Goal 2-37: Reduce the amount of fugitive dust released into the atmosphere.	
Policy 2–37.2: Support programs and policies of the South Coast Air Quality Management District regarding restrictions on grading operations at construction projects.	**Consistent.** As outlined in **Section 4.2: Air Quality**, the Project would implement Laws, Ordinances, and Regulations (LOR) AQ-1, MM AQ-1, and MM AQ-5, which would require compliance with SCAQMD Rules 402 and 403, Rule 1113, and Rule 2305 respectively. Rules 402 and 403 include measures to minimize construction dust. Compliance with Rule 1113 would reduce ROG emissions associated with architectural coatings. Rule 2305 would require WAIRE (Warehouse Actions and Investments to Reduce Emissions) Points tracking, which can be earned through emission reduction measures, like zero emission or electric cargo handling equipment, as required by MM AQ-5. Therefore, the Project would comply with this General Plan policy.
Goal 2-39: Mitigate against climate change.	
Policy 2-39.1: Consult with State agencies, SCAG, and the San Bernardino Associated Governments (SANBAG) to implement AB32	**Consistent.** As further discussed in **Section 4.7: Greenhouse Gas Emissions**, the Project would comply with applicable regulations, including SB 32 and SB 375. The Project would implement mitigation

Table 4.10-1: General Plan Consistency Analysis	
General Plan Policy	**Project Consistency**
and SB375 by utilizing incentives to facilitate infill and transit-oriented development.	measures and LORs to reduce impacts associated with GHGs in regard to compliance with AB32 and AB375, to less than significant. Therefore, the Project would comply with this General Plan policy.
Policy 2-39.3: Provide enhanced bicycling and walking infrastructure, and support public transit, including public bus service, the Metrolink, and the potential for Bus Rapid Transit (BRT).	**Consistent.** See consistency analysis for **Policy 2-36.2.**
Goal 2-40: Conserve and enhance Rialto's biological resources.	
Policy 2-40.1: Protect endangered, threatened, rare, and other special status habitat and wildlife species within and along Lytle Creek by working with the United States Wildlife Service and the California Department of Fish and Game to establish Natural Community Conservation Plans, Habitat Conservation Plans (HCP), or other established biological resource protection mechanisms within this sensitive area.	**Consistent.** As discussed in **Section 4.3: Biological Resources**, MM BIO-1a through MM BIO-3 require pre-construction surveys, implementation of a Burrowing Owl Relocation and Mitigation Plan in the event avoidance is not possible, and the removal of habitat that supports nests to occur outside of breeding season. Therefore, the Project would comply with this General Plan policy.
Chapter 3: Investing in Our Future: Economic Development, Redevelopment, and Infrastructure	
Goal 3-8: Promote affordable and quality water service capable of adequately meeting normal and emergency water demands to all areas in Rialto.	
Policy 3-8.1: Require that all new development or expansion of existing facilities bear the cost of expanding the water system to handle the increased demands which they are expected to generate.	**Consistent.** Water service to the project site would be provided by West Valley Water District (WVWD). The Project would include connections to existing facilities located in the adjacent roadways. The Project would not require the expansion of existing facilities, see **Section 4.17: Utilities and Service Systems**. Therefore, the Project would comply with this General Plan policy.
Policy 3-8.10: Support water conservation through requirements for landscaping with drought-tolerant plants and efficient irrigation for all new development and City projects.	**Consistent.** The Project would include approximately 3.7 acres of landscaping. The proposed landscaping plans would include the incorporation of drought-tolerant plants. Therefore, the Project would comply with this General Plan policy.
Goal 3-9: Upgrade and maintain an improved wastewater system with adequate plant efficiency and capacity to protect the health and safety of Rialto residents, businesses, and institutions.	
Policy 3-9.1: Require that all new development or expansion of existing facilities bear the cost of expanding the wastewater disposal system to handle the increased loads which they are expected to generate.	**Consistent.** Wastewater service would be provided by Rialto Water Services. The Project proposes to connect to existing wastewater facilities located in the roadways. As discussed in **Section 4.17: Utilities and Service Systems**, the Project would result in a minimal increase in wastewater and the existing facilities of the Rialto Water Services would adequately serve the project site. Therefore, the Project would comply with this General Plan policy.

Table 4.10-1: General Plan Consistency Analysis	
General Plan Policy	**Project Consistency**
Goal 3-10: Minimize the volume of solid waste that enters local and regional landfills.	
Policy 3-10.2: Encourage the recycling of construction and demolition materials in an effort to divert these items from entering landfills.	**Consistent.** Please see the response to **Policy 2-31.3**.
Chapter 4: Making the Connections: The Circulation Chapter	
Goal 4-1: Provide transportation improvements to reduce traffic congestion associated with regional and local trip increases.	
Policy 4-1.17: Require new streets and improvements to connect to established streets.	**Consistent.** No new streets are required as a part of the Project. Road improvements would be provided along Lowell Street and Locust Avenue. Locust Avenue is a truck route; truck traffic would not use local residential roadways. Therefore, the Project would comply with this General Plan policy.
Policy 4-1.20: Design City streets so that signalized intersections operate at Level of Service (LOS) D or better during the morning and evening peak hours, and require new development to mitigate traffic impacts that degrade LOS below that level. The one exception will be Riverside Avenue south of the Metrolink tracks all the way to the City's southern border, which can operate at LOS E.	LOS is not used under CEQA to evaluate traffic impacts.
Policy 4-1.21: Design City streets so that unsignalized intersections operate with no vehicular movement having an average delay greater than 120 seconds during the morning and evening peak hours, and require new development to mitigate traffic impacts that increase delay above that level.	LOS is not used under CEQA to evaluate traffic impacts.
Goal 4-2: Protect residential neighborhoods from through traffic impacts.	
Policy 4-2.1: Locate new development and their access points in such a way that traffic is not encouraged to utilize local residential streets for access to the development and its parking.	**Consistent.** Access to the project site would be provided from Lowell Street and Locust Avenue. Locust Avenue is a truck route; truck traffic would not use local residential roadways. Therefore, the Project would comply with this General Plan policy.
Policy 4-2.2: Discourage non-local traffic from using neighborhood streets.	**Consistent.** See consistency analysis for **Policy 4-2.1**. The Project and surrounding area is located on land zoned for industrial uses. Truck traffic would not use neighborhood streets. Therefore, the Project would comply with this General Plan policy.
Goal 4-8: Establish and maintain a comprehensive system of pedestrian trails and bicycle routes that provide viable connections throughout the City.	
Policy 4-8.5: Require major developments to include bicycle storage facilities, including bicycle racks and lockers.	**Consistent.** On-site bike racks would be located near the entrances to the office area of the warehouse, which is proposed near the northeast corner of the building. Therefore, the Project would comply with this General Plan policy.

Table 4.10-1: General Plan Consistency Analysis	
General Plan Policy	**Project Consistency**
Goal 4-9: Promote Walking.	
Policy 4-9.1: Install sidewalks where they are missing, and make improvements to existing sidewalks for accessibility purposes. Priority should be given to needed sidewalk improvement near schools and activity centers. Provide wider sidewalks in areas with higher pedestrian volumes.	**Consistent.** There are no sidewalks adjacent to the project site. The Project proposes a sidewalk along the project site frontage of Locust Avenue and Lowell Street and pedestrian crossings at the driveways. Therefore, the Project would comply with this General Plan policy.
Policy 4-9.2: Require sidewalks and parkways on all streets in new development.	**Consistent.** See consistency analysis for **Policy 4-9.4**.
Policy 4-9.4: Accommodate pedestrians and bicyclists — in addition to automobiles — when considering new development projects.	**Consistent.** As discussed in **Section 4.2: Air Quality**, the Project would implement MM AQ-4, which would require the preparation of a TDM plan to reduce single-occupant vehicle trips and encourage the use of public transit. Further, the Project would provide pedestrian access to the project site with the inclusion of sidewalks along the Project's frontage on Locust Avenue and Lowell Street. Bike storage would be provided on the project site. Therefore, the Project would comply with this General Plan policy.
Policy 4-9.6: Encourage new development to provide pedestrian paths through projects, with outlets to adjacent collectors, secondaries, and arterial roadways.	**Consistent.** See consistency analysis for **Policy 4-9.4.**
Policy 4-9.7: Require ADA compliance on all new or modified handicap ramps.	**Consistent.** Handicap ramps located on the site would comply with ADA requirements. Therefore, the Project would comply with this General Plan policy.
Goal 4-10: Provide a circulation system that supports Rialto's position as a logistics hub.	
Policy 4-10.1: Designate and enforce truck routes for use by commercial trucking as part of the project approval process.	**Consistent.** Trucks travelling to and from the project site would travel along Lowell Street and Locust Avenue; Locust Avenue is a truck route. Therefore, the Project would comply with this General Plan policy.
Policy 4-10.3: Develop appropriate noise mitigation along truck routes to minimize noise impacts on nearby sensitive land uses.	**Consistent.** The nearest sensitive receptor is residential development located approximately 700 feet east of the project site and east of Locust Avenue. As further discussed in **Section 4.12: Noise**, due to distance from the nearest sensitive receptor, noise impacts would be less than significant. Therefore, the Project would comply with this General Plan policy.
Policy 4-10.4: Encourage the development of adequate on-site loading areas to minimize interference of truck loading activities with efficient traffic circulation on adjacent roadways.	**Consistent.** Rialto Municipal Code Table 18.58.030B identifies that 6 loading spaces are required for industrial uses of 320,000 to 400,000 sf plus 1 additional loading space each 100,000 sf or fraction thereof above 400,000 sf. The Project would have 365 passenger vehicle surface parking stalls, 398 truck trailer parking stalls split between two areas on the site, and 82 dock doors. The Municipal Code requires 9 dock doors; 82 would be provided. Therefore, the Project would comply with this General Plan policy.

Table 4.10-1: General Plan Consistency Analysis	
General Plan Policy	**Project Consistency**
Chapter 5: Safety and Noise	
Goal 5–1: Continue to build the City's fire protection and prevention programs and requirements to minimize fire hazards.	
Policy 5–1.3: Require that all site plans, subdivision plans, and building plans be reviewed by the Fire Department to ensure compliance with appropriate fire regulations, such as California Fire Safe Regulations.	**Consistent.** As addressed in **Section 4.14: Public Services**, prior to commencement of construction activities, Project plans would be reviewed by applicable City departments to ensure compliance with the City's Municipal Code, General Plan, and emergency response and fire safety requirements of the Rialto Fire Department and the California Fire Code. The Project would comply with this General Plan policy.
Goal 5–2: Create a more flood-safe community through development standards and infrastructure improvements.	
Policy 5–2.4: Require the implementation of adequate erosion control measures for development projects to minimize sedimentation damage to drainage facilities.	**Consistent.** The Project requires a SWPPP and WQMP, which would include erosion control Best Management Practices (BMPs) to minimize potential impacts associated with erosion, see **Section 4.9: Hydrology and Water Quality**. Therefore, the Project would comply with this General Plan policy.
Policy 5–2.6: Design new developments with water retention devices and permeable surfaces to minimize flooding of the surface drainage system by peak flows. Consult with water agencies and the San Bernardino County Flood Control District to consider the potential for larger-scale capture via diversion to large-scale spreading grounds or other options on a site-by-site basis.	**Consistent.** As discussed under consistency with **Policy 2-18.3**, landscaping would be included throughout the project site to retain runoff. The Project proposes a network of underground piping and conveyance to three on-site underground infiltration basins. These basins would serve as a water quality best management practice which would treat storm water runoff on site before release. Therefore, the Project would comply with this General Plan policy.
Goal 5-5: Minimize impacts to public health, safety, and welfare as a result of seismic and geologic hazards.	
Policy 5–5.1: Require geotechnical investigations by certified engineering geologist or other qualified professionals for all grading and construction projects subject to geologic hazards, including fault rupture, severe ground shaking, liquefaction, landslides, and collapsible or expansive soils. Particular attention should be paid to areas within Alquist-Priolo Earthquake Fault Zones.	**Consistent.** As addressed in **Section 4.6: Geology and Soils**, the Project would implement Standard Condition (SC) GEO-1, which would require the Project Applicant to provide a site-specific, design-level geotechnical investigation for review and approval to the City of Rialto Community Development Department and Public Works Department. The City would review all Project plans for grading, foundation, structural, infrastructure, and all other relevant construction permits relative to the Preliminary Geotechnical Investigation's recommendations and code requirements. Therefore, the Project would comply with this General Plan policy.
Policy 5–5.2: Require all construction to be in conformance with the California Building Code (CBC), and to be consistent with the Municipal Code as it provides for earthquake-resistant design, excavation, and grading.	**Consistent**. State laws and local ordinances require that, prior to construction, potential seismic hazards be identified and mitigated, as needed, to protect public health and safety from substantial risks through appropriate engineering practices. Project construction would be required to conform to California Building Code (CBC) and California Health and Safety Code seismic design requirements (or applicable adopted code at the time of plan submittal or grading and building permit issuance for construction), see **Section 4.6: Geology and Soils**. The building and safety standards established by these codes have been developed to address structural integrity during a seismic event. Please also see the response to **Policy 5-5.1**. Therefore, the Project would comply with this General Plan policy.

Table 4.10-1: General Plan Consistency Analysis	
General Plan Policy	**Project Consistency**
Goal 5–8: Ensure that first responders and the Emergency Operations Center (EOC) have adequate capacity to respond to hazard events.	
Policy 5–8.7: Require that development be phased in relation to the City's ability to provide an adequate level of fire protection, pursuant to the City standard of cover and fire department strategic plan.	**Consistent.** As addressed in **Section 4.14: Public Services**, the Project would include 20 fire hydrants located throughout the project site. The fire hydrants would connect to a proposed fire water line loop, which ultimately connects to the water main in Lowell Street. All driveways have been designed to accommodate the required turning radius for fire engines and would not impair emergency fire service access. In accordance with the City's entitlement process, the Rialto Fire Department would review the plot plan to ensure compliance with the City's Fire Code. It is expected that the Rialto Fire Department would adequately serve the site and does not require the construction or expansion of existing fire services or facilities. Therefore, the Project would comply with this General Plan policy.
Goal 5–10: Provide effective, timely and comprehensive policing services that meet the safety needs of Rialto.	
Policy 5-10.3: Continue to encourage design concepts that inhibit and discourage criminal behavior such as Crime Prevention Through Environmental Design (CPTED) techniques.	**Consistent.** As addressed in **Section 4.14: Public Services**, prior to commencement of construction activities, Project plans would be reviewed by the City to ensure compliance with the City's Municipal Code and General Plan as well as all applicable regulations associated with site signage, lighting, perimeter control, and other crime safety preventative measures. SC PS-1 requires that all development plans be evaluated by the City of Rialto Police Department to ensure that public safety design measures are incorporated into the Project plans. SC PS-2 requires the Applicant to contract with a security service to provide security during construction and may include additional security measures, such as the installation of temporary fencing. Therefore, the Project would comply with this General Plan policy.
Goal 5-12: Minimize the impact of point source and ambient noise levels throughout the community.	
Policy 5-12.2: Consider noise impacts as part of the development review process, particularly the location of parking, ingress/egress/loading, and refuse collection areas relative to surrounding residential development and other noise-sensitive land uses.	**Consistent.** The nearest sensitive receptor is residential development located approximately 700 feet east of the project site and east of Locust Avenue. As further discussed in **Section 4.12: Noise,** due to distance from the nearest sensitive receptor, noise impacts would be less than significant. Therefore, the Project would comply with this General Plan policy.
Policy 5–12.3: Ensure that acceptable noise levels are maintained near schools, hospitals, and other noise sensitive areas in accordance with the Municipal Code and noise standards contained in Exhibit 5-5.	**Consistent.** See consistency analysis for **Policy 5-12.2.**
Goal 5-13: Minimize the impacts of transportation-related noise.	
Policy 5-13.3: Require development of truck-intensive uses to minimize noise impacts on adjacent uses through appropriate site design.	**Consistent.** See consistency analysis for **Policy 5-12.2.** No noise impacts have been identified.

Table 4.10-1: General Plan Consistency Analysis	
General Plan Policy	**Project Consistency**
Chapter 7: Our Roots: Cultural and Historical Resources	
Goal 7-1: Preserve Rialto's significant historical resources as a source of community identity, stability, aesthetic character, and social value.	
Policy 7-1.1: Protect the architectural, historical, agricultural, open space, environmental, and archaeological resources in Rialto.	**Consistent.** As discussed in **Section 4.4: Cultural Resources**, the Project would have a less than significant impact on unknown archaeological resources with the implementation of mitigation. The Project would implement SC CUL-1 and MM CUL-1 which outlines compliance with California Health and Safety Code Section 7050.5 and Public Resources Code Section 5097.98 associated with human remains and the procedure and treatment of unknown historic and/or archaeological resources discovered during Project construction activities. Therefore, the Project would comply with this General Plan policy.
Goal 7-3: Identify, document, and protect significant archaeological resources in Rialto.	
Policy 7-3.1: Require archaeological surveys during the development review process for all projects in archaeologically sensitive areas where no previous surveys are recorded.	**Consistent.** As further discussed, in **Section 4.4: Cultural Resources**, no significant archaeological resources have been recorded on the project site. SC CUL-1 and MM CUL-1 are applicable. Therefore, the Project would comply with this General Plan policy.
Policy 7-3.3: Avoid impacts to potentially significant prehistoric and historical archaeological resources and sites containing Native American human remains consistent with State law.	**Consistent.** See consistency with **Policy 7-1.1**.
Policy 7-3.4: Reduce adverse impacts to significant archaeological resources that cannot be protected in place through data recovery excavations.	**Consistent.** See consistency with **Policy 7-1.1.**
Chapter 9: Environmental Justice	
Goal 9–3: Establish and maintain a comprehensive system of pedestrian trails and bicycle routes that provide viable connections throughout the City (Circulation Element Goal 4-8) and prioritize implementation in DACs with limited walking and biking infrastructure.	
Policy 9–3.5: Require major developments to include bicycle storage facilities, including bicycle racks and lockers (Circulation Element Policy 4-8.5).	**Consistent.** See consistency with **Policy 4-8.5.**
Goal 9–4: Increase Safe and Comfortable Walking and Wheelchair Mobility	
Policy 9-4.1: Require that new development projects incorporate design features that encourage ridesharing, transit use, park and ride facilities, and bicycle and pedestrian circulation (Land Use, Community Design, Open Space, and Conservation Element Policy 2-36.2).	**Consistent.** See consistency with **Policy 2-36.2.**

Table 4.10-1: General Plan Consistency Analysis	
General Plan Policy	**Project Consistency**
Policy 9–4.6: Require ADA compliance on all new or modified handicap ramps (Circulation Element Policy 4-9.7).	**Consistent.** Handicap ramps located on the site would comply with ADA requirements. Therefore, the Project would comply with this General Plan policy.
Goal 9–5: Reduce air pollution impacts in DACs.	
Policy 9–5.2: Locate new development and their access points in such a way that traffic is not encouraged to utilize local residential streets for access to the development and its parking (Circulation Element Policy 4-2.1).	**Consistent.** Access to the project site would be provided from Lowell Street and Locust Avenue. Locust Avenue is a truck route; truck traffic would not use local residential roadways. Therefore, the Project would comply with this General Plan policy.
Policy 9–5.5: Apply conditions of approval to any industrial or warehouse use to minimize the public health impact of that use. Build on existing City and Regional Agency efforts to create a menu of mitigation options including but not limited to building and parking orientation, vegetation and sound buffers, truck route compliance enforcement, zero emission truck usage, solar panel installation, and air filtration systems.	**Consistent.** Please refer to **Section 4.2: Air Quality** which addresses air quality and health risk; **Section 4.2: Air Quality** and **Section 4.7: Greenhouse Gas Emissions** which address air quality, health risk, and emission reduction requirements for the Project. The proposed warehouse would be constructed and operated adjacent to other industrial, warehouse, and office uses. There are no sensitive receptors adjacent and proximate to the project site. Trucks would directly access Locust Avenue or access Locust Avenue from Lowell Street. Locust Avenue is a designated truck route as shown in the General Plan. Additionally, the warehouse building would be designed to have 15% of the roof area solar-ready, in accordance with Title 24 standards. Therefore, the Project would comply with this General Plan policy.
Goal 9–6: Proactively address hazardous waste and water pollution concerns where possible, and aggressively pursue actions that correct spills and contamination when it occurs.	
Policy 9–6.4: Apply methodologies and assign responsibility to protect the quality of groundwater from pollution by landfills and industrial uses (Land Use, Community Design, Open Space, and Conservation Element Policy 2-29.5).	**Consistent.** As addressed in **Section 4.9: Hydrology and Water Quality**, the Project proposes a network of underground piping that conveys runoff to three on-site underground infiltration basins. The basins would serve as both a water quality BMP as well as an underground storage facility to detain and mitigate the peak flow rate. Catch basins throughout the project site would capture storm flows, and route flows toward underground storm basins for treatment and infiltration. Hydrodynamic separators are included in each underground basin for the pretreatment of larger sediments and pollutants. The underground basins would treat the remaining pollutants of concern through infiltration into and through the subsurface soil. The underground basins would be routinely inspected and sediment buildup would be removed to maintain efficient operation of the basins. Therefore, the Project's storm water infrastructure was designed to capture and treat storm water flows and would not impact water quality standards. Landscaped areas are also provided throughout the site on areas that are not paved or built over to reduce excess irrigation or storm water runoff and propose surface filtration. The Project would comply with this General Plan policy.

City of Rialto. 2023. *Rialto Focused General Plan Update 2024.* Retrieved from: https://www.rialtoca.gov/773/2023-City-of-Rialto-Focused-General-Plan. Accessed October 23, 2024	

Rialto Airport Specific Plan Consistency Analysis

The proposed Project would develop a warehouse use, which is consistent with the allowed uses identified in the Rialto Airport Specific Plan for the I-GM zone. The I-GM zone is identified for industrial use in Table 7 of the Specific Plan; warehousing is a permitted use within the I-GM zone in Table 8 of the Specific Plan. As shown in **Table 4.10-2: Rialto Airport Specific Plan Policy Consistency** and **Table 4.10-3: Rialto Airport Specific Plan Standards Consistency**, the Project would comply with applicable development regulations and design guidelines for industrial development in the Rialto Airport Specific Plan area.

Table 4.10-2: Rialto Airport Specific Plan Policy Consistency

Standard	Consistency Analysis
Section 5.5: Development Regulations, Non-Residential Uses	**Consistent.** The Project would comply with Rialto Airport Specific Plan Section 5.5, which describes the development regulations for industrial developments in the Rialto Airport Specific Plan area. The Project would provide a front setback of approximately 237 feet along Lowell Street, more than the required minimum 25-foot setback identified in Table 9 of the Specific Plan. Minimum side and rear setback requirements are 0 feet. However, the Project's secured truck trailer parking lot would be set back from the property boundary along Locust Avenue by approximately25.75 feet, the warehouse building would be setback from the property boundary adjacent to other industrial uses on the east by approximately 197 feet and from the property boundary on the west along Lake Padden Lane by approximately 76 feet, and from the rear by approximately 110 feet. The dock loading area would be located on the east side of the building, sited behind and below eastern abutting existing uses as viewed from Locust Avenue. Additionally, the Project would comply with Rialto Airport Specific Plan Section 5.5.5, which identifies that front and street side yards should be landscaped and consist predominantly of drought tolerant, low maintenance plant materials. Additionally, the Rialto Airport Specific Plan requires projects designated I-GM to provide a minimum 20-foot average width of landscaping from the property line along public roadways. The Project proposes landscaping along the project site's perimeter along Locust Avenue, Lowell Street, and Lake Padden Lane. Along the public roads which include Locust Avenue and Lowell Street, the landscape buffer would be 20 feet wide. In addition, the Project would provide landscaping throughout the project site focused near parking lot areas and driveway entries, for a total landscaped area of approximately 160,491 sf or 9.2 percent of the site. Further, in compliance with Rialto Airport Specific Plan Section 5.5.3, the proposed Project would provide signage in accordance with Rialto Municipal Code Section 18.102.060. Rialto Airport Specific Plan Section 5.5.4 also requires that parking be compliant with the Rialto Municipal Code Title 18. **Table 4.10-4: Rialto Municipal Code Consistency** further analyzes Project consistency with the Rialto Municipal Code. Therefore, the Project would comply with this Rialto Airport Specific Plan policy.
Section 6.2.5: Design Guidelines, Industrial	**Consistent.** As discussed in **Section 4.1: Aesthetics**, the proposed Project would be consistent with the Design Guidelines for industrial uses identified in Rialto Airport Specific Plan Section 6.2.5. As discussed further in **Table 4.10-4: Rialto Municipal Code Consistency**, the Specific Plan requires signage and parking standards to comply with the regulations identified in the City's Municipal Code. Therefore, the Project would comply with this Rialto Airport Specific Plan policy.

Source: City of Rialto. 1997. *Rialto Airport Specific Plan*. Table 8. Retrieved from https://www.rialtoca.gov/DocumentCenter/View/570/Rialto-Airport-Specific-Plan-PDF. Accessed October 23, 2024.

Table 4.10-3: Rialto Airport Specific Plan Standards Consistency

Standard	Required per I-GM Zone[1]	Proposed Project
Automobile Parking	365 stalls[2]	365 stalls
Loading Docks	9 docks[3]	82 docks
Maximum Height	75 feet	55 feet
Floor Area Ratio	1.0[4]	0.38
Front Setbacks	25 feet	236.67 feet on Lowell Street
Side Setbacks	0 to 15 feet	25.75 feet on the east[5] 197 feet on the east[6] 76 feet on the west
Rear Setbacks	0 to 15 feet	110.33 feet

Note:
1. Standards are derived from the Rialto Airport Specific Plan unless otherwise noted.
2. Per Rialto Municipal Code § 18.58.050.
3. Loading Space Requirements per Rialto Municipal Code Table 18.58.030B.
4. Per Rialto General Plan, page 2-10.
5. Setback is the distance from the parcel boundary to the secured truck trailer parking lot.
6. Setback is the distance from parcel boundary to the warehouse dock doors.

The proposed Project would not result in a change in, or conflict with the Specific Plan in such a way that would result in potentially significant impacts. The Project is consistent with the zoning for the site. Therefore, impacts associated with existing Specific Plan zoning policies would be less than significant and no mitigation is required.

Rialto Municipal Code Consistency Analysis

Rialto Municipal Code Title 17 functions as the City's provisions under the Subdivision Map Act. As discussed in **Chapter 3.0**, the Project proposes to create one parcel and five letter lots. Therefore, the Project is subject to Rialto Municipal Code Title 17.

Rialto Municipal Code Title 18 functions as the City's Zoning Ordinance, which identifies the permitted land uses on all parcels in the City through assigned land use designations and associated land use regulations and development standards. The City Zoning Map, and subsequently the Rialto Airport Specific Plan Land Use Plan, identifies the project site as I-GM. As discussed, the Rialto Airport Specific Plan identifies development standards for the I-GM zone. Project consistency with applicable Rialto Municipal Code sections is provided in **Table 4.10-4: Rialto Municipal Code Consistency**.

The proposed Project would not result in a change in, or conflict with the Rialto Municipal Code in such a way that would result in potentially significant impact. Thus, impacts would be less than significant with incorporation of the above referenced mitigation.

Table 4.10-4: Rialto Municipal Code Consistency

Code Chapter	Consistency Analysis
Chapter 17.20: Dedications and Improvements	**Consistent.** The Project would comply with Rialto Municipal Code Section 17.20.080, which establishes required improvements for lots subject to Title 17. These improvements include appropriate drainage infrastructure, utilities, streetlights, and sidewalks where needed. As discussed in **Section 3.5: Project Characteristics**, of this EIR, the Project proposes right-of-way dedications for public sidewalks on Lowell Street and Locust Avenue as well as sewer and water lines to serve the Project. Therefore, the Project would comply with this chapter of the Municipal Code.
Chapter 18.58: Off-street Parking	**Consistent.** Rialto Municipal Code Section 18.58.030 establishes office, commercial, and industrial parking design standards. These standards require parking areas to be screened and landscaped appropriately. As discussed in **Table 4.10-3**, the Project would provide landscape screening between the public right-of-way and parking areas consisting of drought-resistant ground covers, shrubs, and trees. Rialto Municipal Code Section 18.58.030(J)(2) requires warehouse uses to provide 1 space for every 500 sf, or 1 space per employee on the largest shift as well as one loading space per 10,000 sf. The Project proposes an approximately 664,859-sf warehouse. As identified in **Table 4.10-3**, the Project would meet the required 365 parking stalls and 9 loading stalls. Section 18.58.030(K)(1) requires a minimum of ten percent of the required gross off-street parking area shall be landscaped. Approximately 12,142 sf (or approximately 21.2%) of the parking lot area would be landscaped. Therefore, the Project would exceed all minimum requirements and therefore comply with this chapter of the Municipal Code.
Chapter 18.61: Design Guidelines	**Consistent.** The Project would comply with design standards set forth in this Chapter. As discussed in **Table 4.10-1** and shown in **Figure 3-6, Figure 3-7,** and **Figure 3-8**, the proposed warehouse would be designed with articulated mass, tilt-up construction, glazing on all sides, and the office portion in the front. As described in **Section 3.6.3: Building Design, Landscaping, and Lighting**, proposed colors would include white and grey with blue accents and blue window glazing. Therefore, the Project would comply with this chapter of the Municipal Code.
Chapter 18.65: Precise Plan of Design	**Consistent.** A Precise Plan of Design is required for any new industrial development. The Project includes a Precise Plan of Design, which addresses on-site and off-site improvements. The Project would comply with this chapter of the Municipal Code.

Source: City of Rialto. *City of Rialto Municipal Code*. Retrieved from: https://library.municode.com/ca/rialto/codes/code_of_ordinances. Accessed October 23, 2024.

Conclusion

As assessed in **Tables 4.10-1** through **4.10-4**, the proposed Project is consistent with pertinent land use planning and policy documents, including Connect SoCal, the Rialto General Plan, the Rialto Airport Specific Plan, and the Rialto Municipal Code. Therefore, the proposed Project would have a less than

significant impact on a plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect, and no mitigation measures are required.

4.10.6 Cumulative Impacts

The Project is consistent with applicable land use goals and policies. Although other changes in land use plans and regulations may have occurred with past and present projects in the area and may be necessary for individual future projects, such changes have been, and would be, required to demonstrate consistency with the Rialto General Plan and other City policies such that no significant adverse cumulative impact has occurred or would occur from such changes. Given that the proposed Project would be consistent with the land use policies of the applicable plans, the Project would not combine with any past, present, or reasonably foreseeable future projects to cause a significant adverse cumulative land use impact based on a conflict with a plan or policy. Any associated physical impacts are covered in the individual topic sections. It is also anticipated that regional growth would be subject to review for consistency with adopted land use plans and policies by the County of San Bernardino, City of Rialto, and other cities in the County, in accordance with the requirements of CEQA, the State Zoning and Planning Law, and the State Subdivision Map Act, all of which require findings of plan and policy consistency prior to approval of entitlements for development. Therefore, no significant cumulative impacts associated with plans and policies are anticipated. In addition, the contribution of the proposed Project to any such cumulative impacts would be less than significant because present and probable future projects would also be required to demonstrate consistency with applicable plans, policies, and regulations. The Project would not contribute to any cumulative impacts associated with plan or policy inconsistency and no mitigation is required.

4.10.7 Mitigation Program

Standard Conditions

No standard conditions are applicable.

Mitigation Measures

No mitigation is required.

4.10.8 Level of Significance After Mitigation

No significant land use and planning impacts have been identified and no mitigation is required.

4.10.9 References

City of Rialto. 1997. *Rialto Airport Specific Plan*. Table 8.

City of Rialto. 2023. *Rialto Focused General Plan Update 2024*. Retrieved from: https://www.rialtoca.gov/773/2023-City-of-Rialto-Focused-General-Plan. Accessed October 23, 2024.

4.11 MINERAL RESOURCES

4.11.1 Introduction

This section of the EIR identifies the potential for mineral resources on and near the project site and assesses the potential impacts the Project could have on those resources. Impacts are assessed based on their effects on valuable mineral resources and mineral resource recovery sites.

4.11.2 Regulatory Setting

Federal Regulations

United States Code Title 30: Mineral Lands and Mining

Title 30 of the United States Code discusses mineral lands and mining, covering regulations and laws related to mineral resources on federal lands, such as coal, oil, gas, and other minerals. The United States Code Title Section 30.21a defines the national mining and minerals policy of the United States. This policy dictates that the United States will encourage the development of rational domestic mining reclamation practices, the sustainable development of domestic mineral resources, mining and mineral research, and the advancement of mineral waste disposal and reclamation methods. Title 30 also describes the federal regulations involving the sale of mineral lands.[1]

State Regulations

Surface Mining and Reclamation Act (SMARA)

The Surface Mining and Reclamation Act of 1975 (SMARA) provides regulations and policy regarding surface mining and reclamation operations in California. SMARA ensures that adverse environmental impacts are minimized, and mined lands are restored to a usable condition. SMARA also encourages the production, conservation, and protection of California's mineral resources. California Public Resources Code Section 2207 provides annual reporting requirements for all mines in the State, and the State Mining and Geology Board is granted authority and obligations under this section.

The State Mining and Geology Board has classified land in California based on the availability of mineral resources. Four mineral resources zone (MRZ) designations have been established for classifying sand, gravel, and crushed rock resources:

- MRZ-1: Adequate information indicates that no significant mineral deposits are present or likely to be present, or where it is judged that little likelihood exists for their presence.
- MRZ-2: Adequate information indicates that significant mineral deposits are present or there is a high likelihood for their presence, and development should be controlled.
- MRZ-3: The significance of mineral deposits cannot be determined from the available data.
- MRZ-4: There is insufficient data to assign any other MRZ designation.

Under SMARA, aggregate materials are classified as reserves or resources. Reserves are defined as aggregate materials believed to be acceptable for commercial use that exist within property boundaries owned or leased by an aggregate-producing company, and for which permission allowing extraction and processing has been granted by the proper authorities. Aggregate resources include reserves and similar

[1] United States of America. 1996. *United States Code Title 30.* Retrieved from: https://uscode.house.gov/browse/prelim@title30&edition=prelim. Accessed February 6, 2025.

potentially usable aggregate materials that have been granted. Mineral lands are locally reviewed to ensure that significant mineral deposits are identified and protected. The State Geologist produces an annual report of the disturbed and reclaimed land totals and any amendments to the reclamation plan.

Mineral Resources and Mineral Hazards Mapping Program

The California Department of Conservation's California Geological Survey Mineral Resources Program provides data about California's varied non-fuel mineral resources (such as metals and industrial minerals), mineral hazards (such as radon, mercury, and naturally occurring asbestos), and information about active and historic mining activities throughout the state. The Mineral Resources Program divides its efforts primarily into two areas: Mineral Resources and Mineral Hazards, the latter related to asbestos, mercury, and radon.

Local Regulations

Rialto General Plan

The primary role of the General Plan Chapter 2, *Managing Our Land Supply Element* is to direct the use of the City's land resources in the most equitable and productive manner possible with the aim of providing a high quality of life for residents and the overall community. The General Plan notes that Rialto is predominately developed but some areas remain substantially undisturbed. Most undisturbed areas are in the northern portion of the City. The General Plan provides guidance regarding the City's natural resources and their preservation, including mineral resources. The following list includes General Plan goals and policies that have been adopted by the City for the purpose of avoiding or mitigating an environmental effect and are applicable to the proposed Project.

Goal 2-32 **Balance the provisions of the California Surface Mining and Reclamation Act with City objectives to minimize negative impacts of mining activities on the Rialto community.**

Policy 2-33.4 Establish buffer zones of compatible uses adjacent to mineral extraction areas. Such uses may include industry. Require planting or other visual buffers to screen mining machines, stockpiles, vehicles, and other mining related facilities from visible residential areas.

Rialto Airport Specific Plan

The Rialto Municipal Airport ceased operations in 2014 and the former airport property and much of the properties adjacent to the Rialto Municipal Airport that were suited to accommodate development were removed from the Rialto Airport Specific Plan and incorporated into the Renaissance Specific Plan, which was adopted by the City in 2010. Although the Rialto Municipal Airport is no longer operational, the City's Rialto Airport Specific Plan serves as the zoning ordinance for parcels in the Airport Specific Plan area that were not removed from the Airport Specific Plan, primarily located northwest, west, and east of the former Rialto Municipal Airport. The Airport Specific Plan provides a framework to guide future land use and development decisions in the Airport Specific Plan area. For projects within the Airport Specific Plan area, policies and standards in the Airport Specific Plan will take precedence over more general policies and standards applied throughout the rest of the City.

City of Rialto Municipal Code

Rialto Municipal Code Chapter 18.76: Surface Mining and Land Reclamation. Chapter 18.76 recognizes that the extraction of minerals is essential to the continued economic well-being of the City and establishes that it is the purpose and intent of the City to ensure the continued availability of important mineral resources, while regulating surface mining operations as required by SMARA. Specifically, Section 18.76.170 addresses mineral resource areas that have been classified by the State Department of Conservation's Division of Mines and Geology or designated by the State Mining and Geology Board as well as the preservation of surface mining operations from incompatible land uses that may impede or preclude mineral extraction or processing, to the extent possible for consistency with the General Plan. Prior to approving a use that would otherwise be incompatible with mineral resource protection, conditions of approval may be applied to encroaching development projects to minimize potential conflicts.

4.11.3 Existing Conditions

Site Conditions

The project site has never been used for mineral extraction. Adjacent properties include light industrial uses to the north; truck storage yards, a concrete manufacturing products facility, and light industrial uses to the north and east; Robertson's Ready Mix concrete plant and mineral recovery site (California Mine ID #: 91-36-0146) to the south and west.

Regional Conditions

The project site is located within the San Bernardino Production-Consumption (P-C) Region according to the California Geological Survey.[2] The San Bernardino P-C Region is the largest of the seven P-C regions within the greater Los Angeles area. The San Bernardino P-C Region includes portions of Riverside and San Bernardino counties. Aggregate resources present within this region are primarily located within existing stream channels and their respective flood plains and alluvial fans.[3] According to Department of Conservation's California Geological Survey SR206 Plate 2 and General Plan Exhibit 2.7: Mineral Resource Zones, the project site is within MRZ-2, specifically, the Lytle Creek Alluvial fan area which contains Portland cement concrete (PCC) grade aggregate (MRZ-2 PCC-1). The MRZ-2 designation applies to areas where geologic data indicate that significant Portland cement concrete-grade aggregate resources are present.

4.11.4 Methodology

The proposed Project is evaluated against the significance criteria below, as the basis for determining the level of impacts related to mineral resources. This analysis considers existing government-produced data from agencies such as the federal government, State government, and the City of Rialto to avoid or reduce potential environmental impacts. Where significant impacts remain, despite compliance with regulatory framework feasible mitigation measures are recommended, where warranted, to avoid or reduce the Project's potentially significant environmental impacts.

[2] California Geological Survey (CGS). 2008. *Update of Mineral Land Classification for Portland Cement Concrete-Grade Aggregate in the San Bernardino Production-Consumption Region, San Bernardino and Riverside Counties, California*. Accessed September 4, 2024.

[3] Ibid.

4.11.5 Thresholds of Significance

The following significance criteria for mineral resources were derived from the Environmental Checklist in CEQA Guidelines, Appendix G. The proposed Project would result in a significant impact related to mineral resources if it would:

- Result in the loss of availability of a known mineral resource that would be a value to the region and the residents of the State.
- Result in the loss of availability of a locally important mineral resource recovery site delineated on local general plan, specific plan or other land use plan.

4.11.6 Project Impacts and Mitigation

Threshold 4.11-1:	**Would the Project result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state? or**
Threshold 4.11-2:	**Would the Project result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?**
	Level of Significance: Less than Significant Impact

According to Department of Conservation's California Geological Survey maps and as shown on General Plan Exhibit 2.7: Mineral Resource Zones, the project site is within MRZ-2, which is an area where PCC-grade aggregate resources are present (MRZ-2 PCC-1). The General Plan does not include goals or policies to protect against losses of valuable mineral resources. The goals and policies in the *Managing Our Land Supply Element* of the General Plan are designed to protect surrounding uses from the impacts of mining operations and to ensure that reclamation and alternative uses of mining sites are explored. Municipal Code Section 18.76.020 contains provisions to protect existing mining operations from intrusion of incompatible land uses. The Municipal Code also encourages mineral extraction in compatible areas. These standards help to reduce impacts to valuable mineral resources by providing potential and existing mining extraction operations with regulations designed to protect the resource. While the project site is adjacent to the Roberston's Ready Mix concrete plant which is an active mineral recovery site, the project site has never been used for mineral extraction. Further, according to the California Geological Survey Special Report 206, the project site is not designated as a mining sector, which means resource extraction is not planned to occur on the site.

The City's Zoning Code contains provisions to protect existing mining operations from intrusion of incompatible land uses. Municipal Code Section 18.76.020 defines incompatible land uses as those "land uses inherently incompatible with mining and/or that require public or private investment in structures, land improvements, and landscaping and that may prevent mining because of the greater economic value of the land and its improvements." Examples of incompatible land uses cited by the Municipal Code include high density residential, low density residential with high unit value, public facilities, geographically limited but impact intensive industrial, and commercial. The proposed Project would develop a building containing warehouse and office space and surface parking, which would not be incompatible land uses.

The project site does not have land use designations that would allow for mineral resource extraction. The site has a General Industrial General Plan land use designation and is zoned General Manufacturing

(I-GM) as set forth in the Rialto Airport Specific Plan. The I-GM district allow uses including warehousing, manufacturing, and multi-tenant spaces. Resource extraction uses are not permitted. Areas in the City have a designation of Open Space to protect aggregate resources as long as mining activity is feasible. The project site is not located within an area protected by the City for mining development.

The Department of Conservation's California Geological Survey maps (specifically, Special Report 206 Plate 2), the General Plan, and Rialto Airport Specific Plan do not identify the project site as an existing, planned, or potential mineral recovery site. Therefore, Project implementation would not result in the loss of availability of a State, regional, or locally important mineral resource recovery site. Impacts to mineral resources would be less than significant and no mitigation is required.

4.11.7 Cumulative Impacts

As concluded above, Project implementation would result in a less than significant impact on mineral resource availability. While a mineral recovery site operates directly west of the project site, as discussed above, given existing local standards and regulations (including incompatible zoning) precluding potential mineral resource recovery expansion, Project implementation would not impact such facilities. Further, all subsequent proposed projects near the City's existing resource recovery sites would undergo the City's review process, which includes project compliance with Municipal Code Section 18.76 and CEQA when applicable. Therefore, the Project would not result in incremental effects to mineral resources that could be compounded or increased when considered together with similar effects from other past, present, and reasonably foreseeable probable future projects. Therefore, following compliance with applicable State and local regulations, the Project would not result in a cumulatively considerable impact regarding mineral resources and no mitigation is required.

4.11.8 Mitigation Program

Standard Conditions

No standard conditions are applicable.

Mitigation Measures

No mitigation is required.

4.11.9 Level of Significance After Mitigation

The Project would result in a less than significant impact associated with mineral resources and no mitigation is required.

4.12 NOISE

4.12.1 Introduction

This section of the EIR describes both construction-related and operational noise and vibration levels to on-site and surrounding land uses resulting from the Project. The analysis in the section evaluates the level of noise impacts the Project would have on the environment. Noise data and assumptions that are used for quantifying the Project's noise impacts are included as **Appendix I: Noise Modeling Data** to this EIR.

4.12.2 Terminology

Sound and Environmental Noise

Acoustics is the science of sound. Sound can be described as the mechanical energy of a vibrating object transmitted by pressure waves through a medium (e.g., air) to human (or animal) ear. If the pressure variations occur frequently enough (at least 20 times per second), they can be heard and are called sound. The number of pressure variations per second is called the frequency of sound and is expressed as cycles per second, or hertz (Hz).

Noise is defined as loud, unexpected, or annoying sound. The fundamental acoustics model consists of a noise source, a receptor, and the propagation path between the two. The loudness of the noise source, obstructions, or atmospheric factors affecting the propagation path, determine the perceived sound level and noise characteristics at the receptor. Acoustics deal primarily with the propagation and control of sound. A typical noise environment consists of a base of steady background noise that is the sum of many distant and indistinguishable noise sources. The sound from individual local sources is superimposed on this background noise. These sources can vary from an occasional aircraft or train passing by to continuous noise from traffic on a major highway. Perceptions of sound and noise are highly subjective from person to person.

Measuring sound directly in terms of pressure would require a large range of numbers. To avoid this, the decibel (dB) scale was devised. The dB scale uses the hearing threshold of 20 micropascals (µPa) as a point of reference, defined as 0 dB. Other sound pressures are then compared to this reference pressure, and the logarithm is taken to keep the numbers in a practical range. The dB scale allows a million-fold increase in pressure to be expressed as 120 dB, and changes in levels correspond closely to human perception of relative loudness. **Table 4.12-1: Typical Noise Levels** provides typical noise levels.

Noise Descriptors

The dB scale alone does not adequately characterize how humans perceive noise. The dominant frequencies of a sound have a substantial effect on the human response to that sound. Several rating scales have been developed to analyze the adverse effect of community noise on people. Because environmental noise fluctuates over time, these scales consider that the effect of noise on people is largely dependent on the total acoustical energy content of the noise, as well as the time of day when the noise occurs. Most commonly, environmental sounds are described in terms of L_{eq} that has the same acoustical energy as the summation of all the time-varying events. While L_{eq} represents the continuous sound pressure level over a given period, the day-night noise level (L_{dn}) and Community Equivalent Noise Level (CNEL) are measures of energy average during a 24-hour period, with dB weighted sound levels from 7:00 PM to 7:00 AM. Each is applicable to this analysis and defined in **Table 4.12-2: Definitions of Acoustical Terms**.

Table 4.12-1: Typical Noise Levels

Common Outdoor Activities	Noise Level (dBA)	Common Indoor Activities
	– 110 –	Rock Band
Jet fly-over at 1,000 feet		
	– 100 –	
Gas lawnmower at 3 feet		
	– 90 –	
Diesel truck at 50 feet at 50 mph		Food blender at 3 feet
	– 80 –	Garbage disposal at 3 feet
Noisy urban area, daytime		
Gas lawnmower, 100 feet	**– 70 –**	Vacuum cleaner at 10 feet
Commercial area		Normal Speech at 3 feet
Heavy traffic at 300 feet	**– 60 –**	
		Large business office
Quiet urban daytime	**– 50 –**	Dishwasher in next room
Quiet urban nighttime	**– 40 –**	Theater, large conference room (background)
Quiet suburban nighttime		
	– 30 –	Library
Quiet rural nighttime		Bedroom at night, concert hall (background)
	– 20 –	
		Broadcast/recording studio

Table 4.12-2: Definitions of Acoustical Terms	
Term	**Definitions**
Decibel (dB)	A unit describing the amplitude of sound, equal to 20 times the logarithm to the base 10 of the ratio of the pressure of the sound measured to the reference pressure. The reference pressure for air is 20.
Sound Pressure Level	Sound pressure is the sound force per unit area, usually expressed in µPa (or 20 micronewtons per square meter), where 1 pascals is the pressure resulting from a force of 1 newton exerted over an area of 1 square meter. The sound pressure level is expressed in dB as 20 times the logarithm to the base 10 of the ratio between the pressures exerted by the sound to a reference sound pressure (e.g., 20 µPa). Sound pressure level is the quantity that is directly measured by a sound level meter.
Frequency (Hz)	The number of complete pressure fluctuations per second above and below atmospheric pressure. Normal human hearing is between 20 Hz and 20,000 Hz. Infrasonic sound are below 20 Hz and ultrasonic sounds are above 20,000 Hz.
A-Weighted Sound Level (dBA)	The sound pressure level in dB as measured on a sound level meter using the A-weighting filter network. The A-weighting filter de-emphasizes the very low and very high frequency components of the sound in a manner similar to the frequency response of the human ear and correlates well with subjective reactions to noise.
Equivalent Noise Level (L_{eq})	The average acoustic energy content of noise for a stated period of time. Thus, the L_{eq} of a time-varying noise and that of a steady noise are the same if they deliver the same acoustic energy to the ear during exposure. For evaluating community impacts, this rating scale does not vary, regardless of whether the noise occurs during the day or the night.
Maximum Noise Level (L_{max}) Minimum Noise Level (L_{min})	The maximum and minimum dBA during the measurement period.
Exceeded Noise Levels (L_{01}, L_{10}, L_{50}, L_{90})	The dBA values that are exceeded 1%, 10%, 50%, and 90% of the time during the measurement period.
Day-Night Noise Level (L_{dn})	A 24-hour average L_{eq} with a 10 dBA weighting added to noise during the hours of 10:00 PM to 7:00 AM to account for noise sensitivity at nighttime. The logarithmic effect of these additions is that a 60 dBA 24-hour L_{eq} would result in a measurement of 66.4 dBA L_{dn}.
Community Noise Equivalent Level (CNEL)	A 24-hour average L_{eq} with a 5 dBA weighting during the hours of 7:00 AM to 10:00 PM and a 10 dBA weighting added to noise during the hours of 10:00 PM to 7:00 AM to account for noise sensitivity in the evening and nighttime, respectively. The logarithmic effect of these additions is that a 60 dBA 24-hour L_{eq} would result in a measurement of 66.7 dBA CNEL.
Ambient Noise Level	The composite of noise from all sources near and far. The normal or existing level of environmental noise at a given location.
Intrusive	That noise which intrudes over and above the existing ambient noise at a given location. The relative intrusiveness of a sound depends on its amplitude, duration, frequency, and time of occurrence and tonal or informational content as well as the prevailing ambient noise level.

Because sound levels can vary markedly over a short period of time, a method for describing either the sound's average character (L_{eq}) or the variations' statistical behavior must be utilized. The scientific instrument used to measure noise is the sound level meter. Sound level meters can accurately measure environmental noise levels to within about plus or minus 1 dBA. Various computer models are used to predict environmental noise levels from sources, such as roadways and airports. The predicted models'

accuracy depends on various factors, such as the distance between the noise receptor and noise source, the character of the ground surface (e.g., hard or soft), and the presence or absence of structures (e.g., walls or buildings) or topography, and how well model inputs reflect these conditions.

A-Weighted Decibels

The perceived loudness of sound is dependent on many factors, including sound pressure level and frequency content. However, within the usual range of environmental noise levels, perception of loudness is relatively predictable and can be approximated by dBA values. There is a strong correlation between dBA and the way the human ear perceives sound. For this reason, the dBA has become the standard tool of environmental noise assessment. All noise levels reported in this section are in terms of dBA, but are expressed as dB, unless otherwise noted.

Addition of Decibels

The dB scale is logarithmic, not linear, and therefore sound levels cannot be added or subtracted through ordinary arithmetic. Two sound levels 10 dB apart differ in acoustic energy by a factor of 10.[1] When the standard logarithmic dB is A-weighted, an increase of 10 dBA is generally perceived as a doubling in loudness.[2] For example, a 70 dBA sound is half as loud as an 80 dBA sound and twice as loud as a 60 dBA sound. When two identical sources are each producing sound of the same loudness, the resulting sound level at a given distance would be 3 dBA higher than one source under the same conditions.[3] Under the dB scale, three sources of equal loudness together would produce an increase of 5 dBA.[4]

Sound Propagation and Attenuation

Sound spreads (propagates uniformly outward in a spherical pattern), and the sound level decreases (attenuates) at a rate of approximately 6 dB for each doubling of distance from a stationary or point source.[5] Sound from a line source, such as a highway, propagates outward in a cylindrical pattern. Sound levels attenuate at a rate of approximately 3 dB for each doubling of distance from a line source, such as a roadway, depending on ground surface characteristics.[6] No excess attenuation is assumed for hard surfaces like a parking lot or a body of water. Soft surfaces, such as soft dirt or grass, can absorb sound, so an excess ground-attenuation value of 1.5 dB per doubling of distance is normally assumed. For line sources, an overall attenuation rate of 3 dB per doubling of distance is assumed in this EIR analysis.

Noise levels may also be reduced by intervening structures; generally, a single row of buildings between the noise receptor and noise source reduces the noise level by about 5 dBA, while a solid wall or berm can reduce noise levels by 5 to 15 dBA.[7] The manner in which older homes in California were constructed generally provides a reduction of exterior-to-interior noise levels of about 20 to 25 dBA with closed windows. The exterior-to-interior reduction of newer residential units is generally 30 dBA or more.

Human Response to Noise

The human response to environmental noise is subjective and varies considerably from individual to individual. Noise in the community has often been cited as a health problem, not in terms of actual

[7] Federal Highway Administration. April 2006. Highway Traffic and Construction Noise - Problem and Response.

physiological damage, such as hearing impairment, but in terms of inhibiting general well-being and contributing to undue stress and annoyance. The health effects of noise in the community arise from interference with human activities, including sleep, speech, recreation, and tasks that demand concentration or coordination. Hearing loss can occur at the highest noise intensity levels.

Noise environments and consequences of human activities are usually well represented by median noise levels during the day or night or over a 24-hour period. Environmental noise levels are generally considered low when the CNEL is below 60 dBA, moderate in the 60 to 70 dBA range, and high above 70 dBA.[8] Examples of low daytime levels are isolated, natural settings with noise levels as low as 20 dBA and quiet, suburban, residential streets with noise levels around 40 dBA.[9] Noise levels above 45 dBA at night can disrupt sleep. Examples of moderate-level noise environments are urban residential or semi-commercial areas (typically 55 to 60 dBA) and commercial locations (typically 60 dBA). People may consider louder environments adverse, but most will accept the higher levels associated with noisier urban residential or residential-commercial areas (60 to 75 dBA) or dense urban or industrial areas (65 to 80 dBA). Regarding increases in dBA, the following relationships should be noted.[10]

- Except in carefully controlled laboratory experiments, a change of 1 dBA cannot be perceived by humans.
- Outside of the laboratory, a 3 dBA change is considered a just-perceivable difference.
- A change in level of at least 5 dBA is required before any noticeable change in community response would be expected. An increase of 5 dBA is typically considered substantial.
- A 10 dBA change is subjectively heard as an approximate doubling in loudness and would almost certainly cause an adverse change in community response.

Effects of Noise on People

Hearing Loss

While physical damage to the ear from an intense noise impulse is rare, a degradation of auditory acuity can occur even within a community noise environment. Hearing loss occurs mainly due to chronic exposure to excessive noise but may be due to a single event such as an explosion. Natural hearing loss associated with aging may also be accelerated from chronic exposure to loud noise. The Occupational Safety and Health Administration (OSHA) has a noise exposure standard that is set at the noise threshold where hearing loss may occur from long-term exposures. The maximum allowable level is 90 dBA averaged over 8 hours. If the noise is above 90 dBA, the allowable exposure time is correspondingly shorter.

Annoyance

Attitude surveys are used for measuring the annoyance felt in a community for noises intruding into homes or affecting outdoor activity areas. In these surveys, it was determined that causes for annoyance include interference with speech, radio and television, house vibrations, and interference with sleep and rest. The L_{dn} as a measure of noise has been found to provide a valid correlation of noise level and the percentage of people annoyed. People have been asked to judge the annoyance caused by aircraft noise

[10] Compiled from California Department of Transportation. 2017. *Technical Noise Supplement to the Traffic Noise Analysis Protocol*, September 2013, and FHWA, *Noise Fundamentals*.

and ground transportation noise. There continues to be disagreement about the relative annoyance of these different sources. A noise level of about 55 dBA L_{dn} is the threshold at which a substantial percentage of people begin to report annoyance.[11]

Groundborne Vibration

Sources of groundborne vibrations include natural phenomena (earthquakes, volcanic eruptions, sea waves, landslides, etc.) or man-made causes (explosions, machinery, traffic, trains, construction equipment, etc.). Vibration sources may be continuous (e.g., factory machinery) or transient (e.g., explosions). Ground vibration consists of rapidly fluctuating motions or waves with an average motion of zero. Several different methods are typically used to quantify vibration amplitude. One is the peak particle velocity (PPV); another is the root mean square (RMS) velocity. The PPV is defined as the maximum instantaneous positive or negative peak of the vibration wave and is expressed in terms of inches-per-second (in/sec). The RMS velocity is defined as the average of the squared amplitude of the signal and is expressed in terms of velocity decibels (VdB). The PPV and RMS vibration velocity amplitudes are used to evaluate human response to vibration.

Table 4.12-3: Human Reaction and Damage to Buildings for Continuous or Frequent Intermittent Vibrations, displays the reactions of people and the effects on buildings produced by continuous vibration levels. The annoyance levels shown in the table should be interpreted with care since vibration may be found to be annoying at much lower levels than those listed, depending on the level of activity or the individual's sensitivity. To sensitive individuals, vibrations approaching the threshold of perception can be annoying. Low-level vibrations frequently cause irritating secondary vibration, such as a slight rattling of windows, doors, or stacked dishes. The rattling sound can give rise to exaggerated vibration complaints, even though there is very little risk of actual structural damage. In high noise environments, which are more prevalent where groundborne vibration approaches perceptible levels, this rattling phenomenon may also be produced by loud airborne environmental noise causing induced vibration in exterior doors and windows.

Ground vibration can be a concern in instances where buildings shake and substantial rumblings occur. However, it is unusual for vibration from typical urban sources such as buses and heavy trucks to be perceptible. Common sources for groundborne vibration are planes, trains, and construction activities such as earth-moving which requires the use of heavy-duty earth moving equipment. For the purposes of this analysis, a PPV descriptor with units of in/sec is used to evaluate construction-generated vibration for building damage and human complaints.

4.12.3 Regulatory Setting

To limit population exposure to physically or psychologically damaging as well as intrusive noise levels, the Federal government, the State of California, various county governments, and most municipalities in the state have established standards and ordinances to control noise.

Federal Regulations

Federal Transit Administration Noise and Vibration Guidance

The Federal Transit Administration (FTA) has published the Transit Noise and Vibration Impact Assessment report to provide guidance on procedures for assessing impacts at different stages of transit Project development. The report covers both construction and operational noise impacts and describes a range of measures for controlling excessive noise and vibration. In general, the primary concern regarding vibration relates to potential damage from construction. The guidance document establishes criteria for evaluating the potential for damage for various structural categories from vibration.

State Regulations

California Government Code

California Government Code Section 65302(f) mandates that the legislative body of each county and city adopt a noise element as part of its comprehensive general plan. The local noise element must recognize the land use compatibility guidelines established by the Governor's Office of Planning and Research's

General Plan Guidelines and Technical Advisories, Appendix D.[12] The guidelines rank noise land use compatibility in terms of "normally acceptable," "conditionally acceptable," "normally unacceptable," and "clearly unacceptable" noise levels for various land use types. Single-family homes are "normally acceptable" in exterior noise environments up to 60 CNEL and "conditionally acceptable" up to 70 CNEL. Multiple-family residential uses are "normally acceptable" up to 65 CNEL and "conditionally acceptable" up to 70 CNEL. Schools, libraries, and churches are "normally acceptable" up to 70 CNEL, as are office buildings and business, commercial, and professional uses.

Title 24 – Building Code

The State's noise insulation standards are codified in the California Code of Regulations, Title 24: Part 1, Building Standards Administrative Code, and Part 2, California Building Code. These noise standards are applied to new construction in California for interior noise compatibility from exterior noise sources. The regulations specify that acoustical studies must be prepared when noise-sensitive structures, such as residential buildings, schools, hotel rooms, or hospitals, are located near major transportation noise sources, and where such noise sources create an exterior noise level of 65 dBA CNEL or higher. Acoustical studies that accompany building plans must demonstrate that the structure has been designed to limit interior noise in habitable rooms to acceptable noise levels. For new multi-family residential buildings and habitable rooms (including hotels), the acceptable interior noise limit for new construction is 45 dBA CNEL.

Regional and Local Regulations

Rialto General Plan

The General Plan specifies exterior noise guidelines for land uses in Chapter 5, *Safety and Noise Element*. The City requires that new developments be designed to meet these guidelines.[13] Noise compatibility can be achieved by avoiding the location of conflicting land uses adjacent to one another, incorporating buffers and noise control techniques including setbacks, landscaping, building transitions, site design, and building construction techniques. Selection of the appropriate noise control technique would vary depending on the level of noise that needs to be reduced as well as the location and intended land use. General Plan policies that directly address reducing and avoiding noise or vibration impacts include the following:

Goal 5-12 **Minimize the impact of point source and ambient noise levels throughout the community.**

Policy 5-12.2 Consider noise impacts as part of the development review process, particularly the location of parking, ingress/egress/loading, and refuse collection areas relative to surrounding residential development and other noise-sensitive land uses.

Policy 5–12.3 Ensure that acceptable noise levels are maintained near schools, hospitals, and other noise sensitive areas in accordance with the Municipal Code and noise standards contained in Exhibit 5-5.

Goal 5-13 **Minimize the impacts of transportation-related noise.**

[12] Governor's Office of Land Use and Climate Innovation. G*eneral Plan Guidelines – Appendix D, Noise Element Guidelines*. Retrieved from: https://opr.ca.gov/docs/OPR_Appendix_D_final.pdf. Accessed August 8, 2024.

[13] City of Rialto, *Rialto Focused General Plan Update 2024, Chapter 5: Safety and Noise,* Retrieved from: https://www.rialtoca.gov/DocumentCenter/View/4458/2023-Safety-Element?bidId=. Accessed August 8, 2024.

Policy 5-13.3 Require development of truck-intensive uses to minimize noise impacts on adjacent uses through appropriate site design.

The City of Rialto is largely built out and the street system is well established, creating challenges for separating noise-sensitive land uses from primary noise sources. Therefore, the Safety and Noise chapter of the General Plan establishes policies guarding against new noise or land use conflicts to minimize the impact of existing noise sources on the community. **Table 4.12-4: Rialto Noise Guidelines for Land Use Planning** presents the City's exterior noise guidelines for land use planning. It should also be noted that the Safety and Noise chapter of the General Plan mentions sound levels exceeding 40 to 45 dBA are generally considered to cause sleep interference within a residence. The General Plan also references Title 24 of the California Health and Safety Code stipulating a maximum of 45 dBA for interior residential noise levels.

Table 4.12-4: Rialto Noise Guidelines for Land Use Planning

Land Use Category	Community Noise Exposure (L_{dn} or CNEL, dBA)			
	Normally Acceptable	Conditionally Acceptable	Normally Unacceptable	Clearly Unacceptable
R2 - Residential 2, R6 - Residential 6	50 – 60	60 – 65	65 – 70	70 – 85
R12 - Residential 12	50 – 60	60 – 65	65 – 70	70 – 85
R21 - Residential 21, R45 - Residential 45	50 – 60	60 – 70	70 – 75	75 – 85
DMU - Downtown Mixed-Use	50 – 60	60 – 75	75 – 80	80 – 85
CC - Community Commercial	50 – 65	65 – 75	75 – 80	80 – 85
GC - General Commercial	50 – 65	65 – 75	75 – 80	80 – 85
BP - Business Park, O - Office	50 – 65	65 – 75	75 – 80	80 – 85
LI - Light Industrial	50 – 70	70 – 75	75 – 80	80 – 85
GI - General Industrial	50 – 75	75 – 85	NA	NA
P - Public Facility, P - School Facility	50 – 60	60 – 65	65 – 70	70 – 85
OSRC - Open Space - Recreation	50 – 75	NA	75 – 80	80 – 85
OSRS - Open Space - Resources	50 – 75	NA	75 – 80	80 – 85

NA = Not Applicable; dBA = Decibel
Normally Acceptable – Specified land use is satisfactory, assuming buildings are of conventional construction.
Conditionally Acceptable – New development should be undertaken only after detailed analysis of noise reduction requirements are made.
Normally Unacceptable – New development should be discouraged, or a detailed analysis of noise reduction requirements must be made.
Clearly Unacceptable – New development should generally not be undertaken.

Source: City of Rialto. 2024. *Rialto Focused General Plan Update 2024 Chapter 5: Safety and Noise*.

Rialto Airport Specific Plan

The Rialto Municipal Airport ceased operations in 2014 and the former airport property and much of the properties adjacent to the Rialto Municipal Airport that were suited to accommodate development were removed from the Rialto Airport Specific Plan and incorporated into the Renaissance Specific Plan, which was adopted by the City in 2010. Although the Rialto Municipal Airport is no longer operational, the City's Rialto Airport Specific Plan serves as the zoning ordinance for parcels in the Airport Specific Plan area that were not removed from the Airport Specific Plan, primarily located northwest, west, and east of the former Rialto Municipal Airport. The Airport Specific Plan provides a framework to guide future land use and development decisions in the Airport Specific Plan area. For projects within the Airport Specific Plan area, policies and standards in the Airport Specific Plan will take precedence over more general policies and standards applied throughout the rest of the City.

City of Rialto Municipal Code

A noise ordinance is intended to control unnecessary, excessive, and annoying sounds from stationary, non-transportation noise sources. Noise ordinance requirements are not applicable to mobile noise sources such as heavy trucks traveling on public roadways. Federal and State laws preempt control of mobile noise sources on public roads. Noise ordinance standards generally apply to industrial and commercial noise sources, as well as parks and schools affecting residential areas. The Municipal Code prohibits the production of excessive noise and is applied to future development within the City to determine potential noise impacts.

The City also identifies permitted hours for disturbances specifically from construction activity under Municipal Code Section 9.50.070. This code states that no person shall be engaged in any type of work relating to construction, alteration, repair, addition, movement, demolition, or improvement to any building or structure except within the hours provided in **Table 4.12-5: Permitted Hours of Construction Work**. However, Section 9.50.060 of the Municipal Code indicates exclusions from the provisions of this specific chapter of the Municipal Code. As described in Section 9.50.060(L) of the Municipal Code, noise sources associated with construction, repair, or excavation, are exempt so long as there is a valid written agreement with the City or any of its political subdivisions that provides for noise mitigation measures.

Table 4.12-5: Permitted Hours of Construction Work

Days of Week	Time[1,2]
October 1 through April 30	
Monday – Friday	7:00 AM to 5:30 PM
Saturday	8:00 AM to 5:00 PM
Sunday	No Permissible Hours
State Holidays	No Permissible Hours
May 1 through September 30	
Monday – Friday	6:00 AM to 7:00 PM
Saturday	8:00 AM to 5:00 PM
Sunday	No Permissible Hours
State Holidays	No Permissible Hours

Notes:
For purposes of this section, the following exceptions shall apply:
[1] Emergency repair of existing installations, equipment, or appliances; and
[2] Such work that complies with the terms and conditions of a written early work permit issued by the city manager or his or her designee upon a showing of a sufficient need and justification for the permit due to hot or inclement weather, the use of an unusually long process material, or other circumstances of an unusual and compelling nature.

Source: City of Rialto, *Code of Ordinances*, Section 9.50.070.

The Project would be subject to the limitations imposed by the City regarding construction noise as identified in **Table 4.11-5**. The following section of the Municipal Code Noise Ordinance is relevant for operational noise.

9.50.050 Controlled hours of operation

It is unlawful for any person to engage in the following activities other than between the hours of 7:00 AM and 8:00 PM in all zones.

A. Operate or permit the use of powered model vehicles and planes;

B. Load or unload any vehicle, or operate or permit the use of dollies, carts, forklifts, or other wheeled equipment that causes any impulsive sound, raucous or unnecessary noise within one thousand feet of a residence;

C. Operate or permit the use of domestic power tools, or machinery or any other equipment or tool in any garage, workshop, house or any other structure;

D. Operate or permit the use of gasoline or electric powered leaf blowers, such as commonly used by gardeners and other persons for cleaning lawns, yards, driveways, gutters and other property;

E. Operate or permit the use of privately operated street/parking lot sweepers or vacuums, except that emergency work and/or work necessitated by unusual conditions may be performed with the written consent of the city manager;

F. Operate or permit the use of pile driver, steam or gasoline shovel, pneumatic hammer, steam or electric hoist or other similar devices;

G. Operate or permit the use of electrically operated compressor, fan, and other similar devices;

H. Perform ground maintenance on golf course grounds and tennis courts contiguous to golf courses that creates a noise disturbance across a residential or commercial property line;

I. Operate or permit the use of any motor vehicle with a gross vehicle weight rating in excess of ten thousand pounds, or of any auxiliary equipment attached to such a vehicle, including but not limited to refrigerated truck compressors, for a period longer than fifteen minutes in any hour while the vehicle is stationary and on a public right-of-way or public space except when movement of the vehicle is restricted by other traffic;

J. Repair, rebuild, reconstruct or dismantle any motor vehicle or other mechanical equipment or devices in a manner so as to be plainly audible across property lines."

Additionally, Section 9.50.060(O) of the Municipal Code states that sounds generated in commercial and industrial zones that are necessary and incidental to the uses permitted therein are exempt from the Controlled Hours of Operation.

4.12.4 Existing Conditions

Existing Noise Levels

The City is impacted by various noise sources. Mobile sources of noise, especially cars, trucks, and trains are the most common and significant sources of noise. Other noise sources are the various land uses (e.g., residential, commercial, institutional, and recreational and parks activities) throughout the City that generate stationary-source noise. The existing mobile noise sources in the Project area are generated by motor vehicles traveling on North Locust Avenue, West Lowell Street, and Lake Padden Lane. The primary sources of stationary noise in the vicinity are those associated with the industrial uses to the north, south, east, and west. Industrial stationary noise sources may include mechanical equipment (use of heating, ventilation, and air conditioning (HVAC) units, etc.) and parking lot activities (cars parking, open and

closing doors, etc.). The noise associated with these sources may represent a single-event noise occurrence, short-term, or long-term/continuous noise.

Mobile Sources

Existing roadway noise levels were calculated for the roadway segments in the Project area using the Federal Highway Administration (FHWA) Highway Traffic Noise Prediction Model (FHWA-RD-77-108) and existing traffic volumes; refer to **Appendix J**. The noise prediction model calculates the average noise level at specific locations based on traffic volumes, average speeds, roadway geometry, and site environmental conditions. The average vehicle noise rates (also referred to as energy rates) used in the FHWA model have been modified to reflect average vehicle noise rates identified for California by the California Department of Transportation (Caltrans). The Caltrans data indicates that California automobile noise is 0.8 to 1.0 dBA higher than national levels and that medium and heavy truck noise is 0.3 to 3.0 dBA lower than national levels.[14] The average daily noise levels along roadway segments near the project site are identified in **Table 4.12-6: Existing Traffic Noise Levels.** Existing traffic-generated noise level on roadways near the project site range from 63.0 dBA CNEL[15] to 64.5 dBA CNEL 100 feet from the centerline.

Table 4.12-6: Existing Traffic Noise Levels

Roadway Segment	ADT	dBA CNEL 100 Feet from Roadway Centerline
Locust Avenue, between Lowell Street to Persimmon Avenue	9,780	68.9
Casmalia Street, between Locust Avenue to Laurel Avenue	10,393	70.5

Sources: Based on traffic data within **Appendix J**; see **Appendix I** for traffic noise modeling assumptions and results.

Noise Measurements

To quantify ambient noise levels in the area, five short-term noise measurements were taken on July 25, 2024. The noise measurement sites were representative of typical existing noise exposure surrounding the project site. The 10-minute measurements were taken between 9:32 AM and 11:09 PM near potential sensitive receptors. Short-term L_{eq} measurements are considered representative of the noise levels throughout the day. The average noise levels and sources of noise measured at each location are listed in **Table 4.12-7: Existing Noise Measurements**.

Table 4.12-7: Existing Noise Measurements

Site	Location	L_{eq} (dBA)	L_{min} (dBA)	L_{max} (dBA)	Time
1	2279 E. Fairview Drive	49.9	34.3	68.0	9:51 AM
2	1767 W. Carpenter Street	50.2	40.5	62.4	10:10 AM
3	Corner of Buxton Street and N. Maple Avenue	56.2	37.2	73.1	10:25 AM
4	South of the project site on W. Stonehurst Drive	64.5	45.8	85.4	10:59 AM
5	Northwest corner of Summit Avenue and Alder Avenue	65.6	63.7	76.1	9:32 AM

Source: Noise measurements taken by Kimley-Horn, July 25, 2024. See **Appendix J** for noise measurement results.

[14] California Department of Transportation. 1987. *California Vehicle Noise Emission Levels*.

[15] CNEL is 24-hour average noise level with a 5 dBA "weighting" during the hours of 7:00 PM to 10:00 PM and a 10 dBA "weighting" added to noise during the hours of 10:00 PM to 7:00 AM to account for noise sensitivity in the evening and nighttime, respectively.

Sensitive Receptors

Sensitive populations are more susceptible to the effects of air pollution than the general population. Sensitive receptors that are in proximity to localized sources of toxics are of particular concern. Land uses considered sensitive receptors include residences, schools, playgrounds, childcare centers, long-term health care facilities, rehabilitation centers, convalescent centers, and retirement homes. The nearest sensitive receptors to the project site are residential uses to the east and southeast. Sensitive land uses nearest to the project site are shown in **Table 4.12-8: Sensitive Receptors**.

Table 4.12-8: Sensitive Receptors

Receptor Description	Distance and Direction from Project Site[1]	Description
Single-Family Residences	700 feet to the east	Along Carpenter Street
Single-Family Residences	700 feet to the southeast	Along Persimmon Avenue
Wilmer Amina Carter High School	1,745 feet to the southeast	Along Maple Avenue
Alec Ferguson Park	2,240 feet to the northwest	Along Casa Grande Drive
Kucera Middle School	3,340 feet to the north	Along Buena Vista Drive
Single-Family Residences	2,060 feet to the north	Along Casa Grande Drive

4.12.5 Methodology

Construction Noise

Construction noise levels were based on typical noise levels generated by construction equipment published by the FTA and the FHWA. Construction noise is assessed in dBA L_{eq}. This unit is appropriate because L_{eq} can be used to describe noise levels from operation of each piece of equipment separately, and levels can be combined to represent the noise level from all equipment operating during a given period.

Construction noise modeling was conducting using the FHWA Roadway Construction Noise Model (RCNM). When calculating construction noise, the equipment was assumed to operate at staggered locations throughout the project site. This methodology accounts for equipment operating at different locations within the project site and not at a fixed location for extended periods of time.[16] The distance used in the RCNM model are provided in **Appendix I**. The City does not establish quantitative construction noise standards. Therefore, this analysis conservatively uses the FTA's threshold of 80 dBA (8-hour L_{eq}) for residential uses and 90 dBA (8-hour L_{eq}) for non-residential uses to evaluate construction noise impacts.

Operational Noise

The analysis of the Without Project and With Project noise environments is based on noise prediction modeling and empirical observations. Reference noise level data are used to estimate the Project operational noise impacts from stationary sources. Noise levels are collected from field noise measurements and other published sources from similar types of activities are used to estimate noise levels expected with the Project's stationary sources. The reference noise levels are used to represent a

[16] Federal Transit Administration. September 2018. *Transit Noise and Vibration Impact Assessment Manual*.

worst-case noise environment as noise levels from stationary sources can vary throughout the day. Operational noise is evaluated based on the standards within the City's Noise Ordinance and General Plan.

An analysis was conducted of the Project's effect on traffic noise conditions at off-site land uses. Without Project traffic noise levels were compared to With Project traffic noise levels. The environmental baseline is the Without Project condition. The Without Project and With Project traffic noise levels in the vicinity of the project site were calculated using the FHWA Highway Noise Prediction Model (FHWA-RD-77-108). The actual sound level at any receptor location is dependent upon such factors as the source-to-receptor distance and the presence of intervening structures (walls and buildings), barriers, and topography. The noise attenuating effects of changes in elevation, topography, and intervening structures were not included in the model. Therefore, the modeling effort is considered a worst-case representation of the roadway noise. In general, a 3-dBA increase in traffic noise is barely perceptible to people, while a 5-dBA increase is readily noticeable.

Vibration

Ground-borne vibration levels associated with Project construction-related activities were evaluated using typical ground-borne vibration levels associated with construction equipment, obtained from FTA published data for construction equipment. Potential ground-borne vibration impacts related to building/structure damage and interference with sensitive existing operations were evaluated, considering the distance from construction activities to nearby land uses and typically applied criteria.

For a structure built traditionally, without assistance from qualified engineers, the FTA guidelines show that a vibration level of up to 0.20 in/sec is considered safe and would not result in any vibration damage. FTA guidelines show that modern engineered buildings built with reinforced-concrete, steel or timber can withstand vibration levels up to 0.50 in/sec and not experience vibration damage. The Caltrans 2020 Transportation and Construction Vibration Guidance Manual identifies a human annoyance vibration criterion of 0.4 in/sec PPV (which is considered severe by people subjected to continuous vibrations). As the nearest structure to the project site is an industrial building, this analysis uses the 0.50 in/sec structural damage criterion and 0.40 in/sec PPV human annoyance criterion.

Where significant impacts remain despite compliance with the regulatory framework, feasible mitigation measures are recommended, where warranted, to avoid or reduce the Project's potentially significant environmental impacts.

4.12.6 Thresholds of Significance

The following significance criteria for noise impacts were derived from the Environmental Checklist in CEQA Guidelines Appendix G. The proposed Project would result in a significant impact related to noise if it would:

- Generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.
- Generate excessive groundborne vibration or groundborne noise levels.

As addressed in **Section 5.1: Effects Found Not to be Significant**, the City has determined that the Project would not have a significant impact on the following threshold for the reasons stated below and that no further analysis was required in the EIR:

- For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

There are no private airstrips or airports located immediately adjacent to or near the project site. The closest airport is the San Bernardino International Airport, which is located approximately 10 miles southeast of the project site. The project site is not subject to an airport land use plan. Therefore, the Project would not expose people residing or working in the project area to excessive airport or airstrip-related noise levels.

Construction Noise Thresholds

The City does not establish quantitative construction noise standards. Therefore, this analysis uses the following construction noise thresholds:

- The FTA's construction noise threshold[17] of 80 dBA (8-hour L_{eq}) for residential uses and 90 dBA (8-hour L_{eq}) for non-residential uses; or
- Increase in existing ambient exterior noise levels by 5 dBA or more at a noise sensitive use.

Per Caltrans and FHWA, a change in noise levels of at least 5 dBA is required before any noticeable change in community response would be expected.[18] An increase of 5 dBA is typically considered substantial. Existing ambient noise levels are shown in **Table 4.12-7**.

Additionally, the following thresholds of significance are set forth in the Rialto Code of Ordinances, which states that a project would normally have a significant impact on noise levels from construction if construction activities occur outside the following hours:

- October 1 through April 30 - 7:00 AM to 5:30 PM Monday through Friday, 8:00 AM to 5:00 PM on Saturday. Construction activities are not permitted on Sundays and State holidays; and May 1 through September 30 - 6:00 AM to 7:00 PM Monday through Friday, 8:00 AM to 5:00 PM on Saturday. Construction activities are not permitted on Sundays and State holidays.

Operational Noise

Operational noise is evaluated based on the standards set in the City's Municipal Code and General Plan.

Vibration

The City does not have a significance threshold to assess vibration impacts. Therefore, this analysis uses the FTA and Caltrans structural damage criterion of 0.50 in/sec PPV for industrial buildings and the human annoyance criterion of 0.4 in/sec PPV.

4.12.7 Project Impacts and Mitigation

Threshold 4.12-1:	**Would the Project generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?**
	Level of Significance: Less than Significant with incorporation of MM NOI-1.

Construction

On-Site Construction Noise. Construction noise typically occurs intermittently and varies depending on the nature or phase of construction (e.g., land clearing, grading, excavation, paving). Noise generated by construction equipment, including earthmovers, material handlers, and portable generators, can reach high levels. The nearest sensitive receptors are approximately 700 feet to the east and southeast of the project site.

Construction activities would include demolition, site preparation, grading, building construction, paving, and architectural coating, and infrastructure improvement. Such activities would require dozers, excavators, and concrete saws during demolition; graders, dozers, excavators, scrapers and tractors during site preparation and grading; cranes, forklifts, generators, tractors, and welders during building construction; pavers, rollers, and paving equipment during paving; air compressors during architectural coating; and excavators, pavers, dozers, and rollers during infrastructure improvements. Typical operating cycles for these types of construction equipment may involve one or two minutes of full power operation followed by three to four minutes at lower power settings. Other primary sources of acoustical disturbance would be random incidents, which would last less than one minute (such as dropping large pieces of equipment or the hydraulic movement of machinery lifts). Noise generated by construction equipment, including earthmovers, material handlers, and portable generators, can reach high levels. Typical noise levels associated with individual construction equipment are listed in **Table 4.12-9: Typical Construction Equipment Noise Levels**.

As previously mentioned, the Rialto Municipal Code (Municipal Code) does not establish quantitative construction noise standards. Therefore, this analysis uses the FTA's threshold of 80 dBA (8-hour L_{eq}) for residential uses and 90 dBA (8-hour L_{eq}) for non-residential uses to evaluate construction noise impacts, as well as a review of any increase in ambient noise at nearby sensitive uses (i.e., residential use) by applying an ambient noise level increase threshold of 5 dBA.

The noise levels identified in **Table 4.12-10: Project Construction Noise Levels**, show estimated unmitigated and mitigated exterior construction noise without accounting for attenuation from existing physical barriers. The nearest noise-sensitive receptors are the residential uses located 700 feet to the east and 700 feet to the southeast of the project site. Additionally, the nearest non-noise sensitive use (i.e., industrial use) is located adjacent to the project site. As shown in the table, , unmitigated exterior construction noise levels could reach 87.5 dBA at the nearest non-noise sensitive use (i.e., industrial use) to the project site. Therefore, unmitigated exterior construction noise levels at the nearest non-noise sensitive use would not exceed the FTA's 90 dBA L_{eq} threshold.

Table 4.12-10: Project Construction Noise Levels

Construction Phase	Land Use	Direction	Unmitigated Modeled Exterior Noise Level (dBA L_{eq})[1]	Mitigated Modeled Exterior Noise Level (dBA L_{eq})[2]	Ambient Noise Threshold (dBA L_{eq})[3]	FTA Noise Threshold (dBA L_{eq})	Does Mitigated Noise Level Exceed Either Threshold?

NA = Not Applicable

1. Equipment was assumed to operate throughout the project site at staggered distances near the property line. The distances used in the RCNM model can be seen in **Appendix I**.
2. Mitigated noise levels include implementation of Mitigation Measure (MM) NOI-1 to reduce construction noise levels. MM NOI-1 would require the proper maintenance of construction equipment and the installation of noise shielding/muffling devices.
3. The ambient noise threshold represents a 5 dBA increase in existing ambient exterior noise levels at a noise sensitive use. Existing ambient noise levels are show in **Table 4.12-7**. Noise Measurement Site 2 (50.2 dBA L_{eq}) is representative of the residential receptors to the east and Noise Measurement Site 3 (56.2 dBA L_{eq}) is representative of the residential receptors to the southeast. With the 5 dBA increase applied, the ambient noise threshold is 55.2 dBA L_{eq} at the residential receptors to the east and 61.2 dBA L_{eq} at the residential receptors to the southeast. The ambient noise threshold does not apply to non-noise sensitive uses.

Source: Federal Highway Administration Roadway Construction Noise Emissions Model; refer to **Appendix I**, Noise Data.

Additionally, unmitigated exterior construction noise levels would range from 50.8 dBA to 64.6 dBA at the nearest noise sensitive uses (i.e., residential uses) to the project site and the FTA's 80 dBA L_{eq} threshold would not be exceeded (**Table 4.12-10**). However, unmitigated construction noise levels at the nearest sensitive uses would exceed the ambient noise threshold during all phases of construction, with the exception of the architectural coating phase. Therefore, the Project would implement Mitigation Measure (MM) NOI-1 to reduce construction noise levels. MM NOI-1 would require the proper maintenance of construction equipment and the installation of noise shielding/muffling devices. The FHWA states that muffler systems can reduce noise levels by 10 dBA or more.[19] As identified in the table, mitigated exterior construction noise levels at noise sensitive uses would not exceed the ambient noise thresholds.

It should be noted that construction equipment would operate throughout the project site and the associated noise levels would not occur at a fixed location for extended periods of time. Although some sensitive uses may be exposed to elevated noise levels during Project construction, heavy construction equipment would be in motion and construction noise would be acoustically dispersed throughout the project site (i.e., not concentrated in one area near sensitive uses). The City has set restrictions on construction hours to control noise impacts from construction activities. Municipal Code Section 9.50.070 states that construction activities may only take place between the hours of 7:00 AM and 5:30 PM on weekdays and between the hours of 8:00 AM and 5:00 PM on Saturdays from October 1 through April 30 and shall only occur between 6:00 AM and 7:00 PM on weekdays and between the hours of 8:00 AM and 5:00 PM on Saturdays from May 1 through September 30.

The Project would be required to comply with the allowable hours of construction set in the Municipal Code. As discussed above, Project construction noise levels would not exceed the FTA or ambient noise thresholds with implementation of MM NOI-1 and impacts would therefore be less than significant.

Operations

Implementation of the proposed Project would create new sources of noise. The major noise sources associated with the Project that would potentially impact existing and future sensitive receptors include the following:

- Mechanical equipment
- Truck and loading dock noise
- Back-up alarms
- Parking areas
- Off-site traffic noise

As discussed previously, Section 9.50.050 of the Municipal Code identifies activities that are unlawful to engage in between the hours of 8:00 PM and 7:00 AM. This includes the loading or unloading any vehicle, or operate or permit the use of dollies, carts, forklifts, or other wheeled equipment that causes any impulsive sound, raucous or unnecessary noise within one thousand feet of a residence. However, Municipal Code Section 9.50.060 notes that sounds generated in commercial and industrial zones that are necessary and incidental to the uses permitted therein are exempt from the provisions of the Municipal Code Chapter 9.50 (Noise Control) including Section 9.5.050 (Controlled Hours of Operation).

Additionally, all loading and unloading activities, including the operation of dollies, carts, and forklifts, would occur within the warehouse buildings while trucks are docked. Loading dock doors would also be surrounded with protective aprons, gaskets, or similar improvements that, when a trailer is docked, would

[19] Federal Highway Administration. 2017. *Special Report - Measurement, Prediction, and Mitigation*, Chapter 4 Mitigation.

serve as a noise barrier between the interior warehouse activities and the exterior loading area. This would attenuate noise emanating from interior activities, and as such, interior loading and associated activities would be permissible during all hours of the day.

Mechanical Equipment. Potential stationary noise sources related to long-term operations would include mechanical equipment. Mechanical equipment (e.g., heating ventilation and air conditioning [HVAC] equipment) typically generates noise levels of approximately 52 dBA at 50 feet.[20] HVAC units would be installed on the roof of the proposed warehouse building. The nearest residential sensitive receptors (residential uses to the east) would be located as close as 2,125 feet from the HVAC equipment at the project site. At this distance mechanical equipment noise would attenuate to approximately 19.4 dBA, which is well below the City's normally acceptable residential exterior noise standard (60 dBA). Operation of mechanical equipment would not increase ambient noise levels at sensitive receptors.[21] Additionally, industrial uses would be located approximately 115 feet southeast from the warehouse building and the mechanical equipment. At this distance, mechanical equipment noise levels would be approximately 44.8 dBA, which is well below the City's normally acceptable exterior noise standard (75 dBA) for general industrial land uses. Further, intervening structures are located between the proposed warehouse structure and the receptors to the east, which would further attenuate HVAC noise levels. Therefore, noise levels associated with mechanical equipment would not exceed the City's noise standards and noise impacts would be less than significant.

Truck and Loading Dock Noise. During loading and unloading activities, noise would be generated by the trucks' diesel engines, exhaust systems, and brakes during low gear shifting braking activities; backing up toward the docks; dropping down the dock ramps; and maneuvering away from the docks. Loading or unloading activities would occur on the eastern side of the project site next to the warehouse building.

Typically, heavy truck operations generate a noise level of 70 dBA at a distance of 50 feet.[22] The closest sensitive receptors would be the single-family residences located approximately 1,880 feet east of the nearest proposed loading areas. At this distance, heavy truck and loading dock noise levels would be 38.5 dBA, which would not exceed the City's normally acceptable residential exterior noise standard (60 dBA). Heavy truck operations would not increase ambient noise levels at sensitive receptors.[23] Additionally, industrial uses would be located approximately 200 feet southeast from the proposed loading areas. At this distance, heavy truck and loading dock noise levels would be approximately 58.0 dBA, which is well below the City's normally acceptable exterior noise standard (75 dBA) for general industrial land uses. Heavy truck and loading dock noise levels at the nearest sensitive receptors would be further attenuated by intervening structures. Additionally, loading dock doors would also be surrounded with protective aprons, gaskets, or similar improvements that, when a trailer is docked, would serve as a noise barrier between the interior warehouse activities and the exterior loading area. This would attenuate noise emanating from interior activities, and as such, interior loading and associated activities would be permissible during all hours of the day. Therefore, noise levels associated with trucks and loading or

[21] Ambient noise levels at the nearest residential sensitive receptors (residential uses to the east) is 50.2 dBA; refer to Noise Measurement Site 2 in **Table 4.12-7**. See **Appendix I** for calculations showing the Project's operational noise level difference from ambient daytime/nighttime noise levels.

[22] Elliott H. Berger, Rick Neitzel, and Cynthia A. Kladden. 2015. *Noise Navigator Sound Level Database with Over 1700 Measurement Values*.

[23] Ambient noise levels at the nearest residential sensitive receptors (residential uses to the southeast) is 56.2 dBA; refer to Noise Measurement Site 3 in **Table 4.12-7**. See **Appendix I** for calculations showing the Project's operational noise level difference from ambient daytime/nighttime noise levels.

unloading activities would not exceed the City's noise standards and noise impacts would be less than significant.

Back-Up Alarms. Medium and heady-duty trucks reversing into loading docks would produce noise from back-up alarms (also known as back-up beepers). Back-up alarms produce a typical volume of 97 dBA at one meter (3.28 feet) from the source.[24] As mentioned above, the closest sensitive receptors would be the single-family residences located approximately 1,880 feet east of the loading dock areas where trucks could be reversing and maneuvering. At this distance, exterior noise levels from back-up alarms would be approximately 41.8 dBA, which is below the City's normally acceptable residential exterior noise standard (60 dBA). Back-up alarms would not increase ambient noise levels at sensitive receptors.[25] Additionally, industrial uses would be located approximately 200 feet southeast from the proposed loading areas where trucks could be reversing and maneuvering. At this distance, back-up alarm noise levels would be approximately 61.3 dBA, which is well below the City's normally acceptable exterior noise standard (75 dBA) for general industrial land uses. Therefore, noise levels associated with back-up alarms would not exceed the City's noise standards and noise impacts would be less than significant.

Parking Noise. The proposed Project would provide 365 passenger vehicle surface parking spaces and 398 truck trailer parking stalls; see **Figure 3-3: Conceptual Site Plan**. The Project would generate up to 200 trips during the peak hour. For the purpose of providing a conservative, quantitative estimate of the noise levels that would be generated from the vehicles entering and exiting the parking lots, the methodology recommended by FTA for the general assessment of stationary transit noise sources is used. Using the methodology, the Project's peak hourly noise level that would be generated by the on-site parking levels was estimated using the following FTA equation for a parking lot:

$$L_{eq(h)} = SEL_{ref} + 10 \log (NA/1{,}000) - 35.6$$

Where:

$L_{eq(h)}$ = hourly L_{eq} noise level at 50 feet

SEL_{ref} = reference noise level for stationary noise source represented in sound exposure level (SEL) at 50 feet

NA = number of automobiles per hour

35.6 is a constant in the formula, calculated as 10 times the logarithm of the number of seconds in an hour

Using FTA's reference noise level of 92 dBA SEL[26] at 50 feet from the noise source, the Project's highest peak hour vehicle trips would generate noise levels of approximately 49.4 dBA L_{eq} at 50 feet from the parking lot. Parking lot noise would occur within the surface parking lots on the project site. It is also noted that parking lot noise occurs at the surrounding industrial uses under existing conditions. Parking lot noise would be consistent with the existing noise in the vicinity and would be partially masked by background noise from traffic along surrounding roadways. The closest sensitive receptors would be the single-family residences located approximately 710 feet east of the nearest parking area and east of Locust Avenue. At

[24] Environmental Health Perspectives. 2024. *Vehicle Motion Alarms: Necessity, Noise Pollution, or Both?,* Retrieved from: https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3018517/. Accessed August 8, 2024.

[25] Ambient noise levels at the nearest residential sensitive receptors (residential uses to the southeast) is 56.2 dBA; refer to Noise Measurement Site 3 in **Table 4.12-7**. See **Appendix I** for calculations showing the Project's operational noise level difference from ambient daytime/nighttime noise levels.

[26] Federal Transit Administration. 2018. Transit Noise and Vibration Impact Assessment Manual.

this distance, parking lot noise levels would be approximately 26.4 dBA, which is below the City's normally acceptable residential exterior noise standard (60 dBA). Parking lot activities would not increase ambient noise levels at sensitive receptors.[27] Additionally, industrial uses would be located approximately 30 feet southeast from the parking areas. At this distance, parking lot noise levels would be approximately 53.8 dBA, which is well below the City's normally acceptable exterior noise standard (75 dBA) for general industrial land uses. Noise associated with parking lot activities is not anticipated to exceed the City's noise standards during operation. Therefore, noise impacts from parking lots would not exceed the City's noise standards and noise impacts would be less than significant.

Off-Site Traffic Noise. Implementation of the Project would generate increased traffic volumes along nearby roadway segments. The Project would result in approximately 1,138 daily vehicle trips. In general, traffic noise level increases of less than 3-dBA is barely perceptible to people, while a 5-dBA increase is readily noticeable. [28] Generally, traffic volumes on area roadways would have to approximately double for the resulting traffic noise levels to increase by 3 dBA. Therefore, permanent increases in ambient noise levels of less than 3 dBA are considered to be less than significant.

The Opening Year "Opening Year With Project" and "Opening Year Without Project" scenarios are compared in **Table 4.12-11: Opening Year Traffic Noise Levels**. As shown in the table, roadway noise levels would range from 68.5 dBA CNEL to 70.7 dBA CNEL without the Project and between 69.1 dBA CNEL and 71.5 dBA CNEL with the Project. The "With Project" noise levels would result in a maximum increase of 1.2 dBA CNEL along North Locust Avenue (between Lowell Street to Persimmon Avenue). No significant impacts would occur and no mitigation is required.

Table 4.12-11: Opening Year Traffic Noise Levels

Roadway Segment	Opening Year Without Project		Opening Year With Project		Change	Significant Impact[3]
	ADT	dBA CNEL[1]	ADT	dBA CNEL[1]		
Locust Avenue, between Lowell Street and Persimmon Avenue	10,200	69.1	11,694	70.3	1.2	No
Casmalia Street, between Locust Avenue and Laurel Avenue	10,800	70.7	11,878	71.5	0.8	No
Riverside Avenue, between Alder Avenue and Locust Avenue	15,400	68.5	15,680	69.1	0.6	No

ADT = average daily trips; dBA = A-weighted decibels; CNEL = community noise equivalent level.

Notes:
1. Traffic noise levels are 100 feet from the roadway centerline. The actual sound level at any receptor location is dependent upon such factors as the source-to-receptor distance and the presence of intervening structures, barriers, and topography.
2. The lowest Normally Acceptable land use compatibility noise standard for developed uses along each roadway segment is conservatively used to analyze impacts.
3. Potential impacts occur when the Project change exceeds 3 dBA and the Normally Acceptable land use compatibility standard is exceeded (i.e., both must occur).

Source: Based on traffic data from **Appendix I**; see **Appendix I** for traffic noise modeling assumptions and results.

[27] Ambient noise levels at the nearest residential sensitive receptors (residential uses to the east) is 50.2 dBA; refer to Noise Measurement Site 2 in **Table 4.12-7**. See **Appendix I** for calculations showing the Project's operational noise level difference from ambient daytime/nighttime noise levels.

[28] California Department of Transportation. 2013. *Technical Noise Supplemental to the Traffic Noise Analysis Protocol*.

Threshold 4.12-2:	**Would the Project expose persons to or generate excessive ground borne vibration or ground borne noise levels?**
	Level of Significance: Less than Significant Impact

Once operational, the Project would not be a source of groundborne vibration. Increases in groundborne vibration levels attributable to the proposed Project would be primarily associated with short-term construction-related activities. Construction on the project site would have the potential to result in varying degrees of temporary groundborne vibration, depending on the specific construction equipment used and the operations involved.

The types of construction vibration impacts include human annoyance and building damage. Human annoyance occurs when construction vibration rises significantly above the criterion of human perception for extended periods of time. Building damage can be cosmetic or structural. Ordinary buildings that are not particularly fragile would not experience any cosmetic damage (e.g., plaster cracks) at distances beyond 30 feet. This distance can vary substantially depending on the soil composition and underground geological layer between vibration source and receiver. In addition, not all buildings respond similarly to vibration generated by construction equipment. The City does not provide numerical vibration standards for construction activities. As the nearest structure is a warehouse building (i.e., Radial) located approximately 40 feet east from the Project's southeastern property line, this impact discussion uses the FTA and Caltrans structural damage criterion of 0.50 in/sec PPV for industrial buildings and the human annoyance criterion of 0.4 in/sec PPV.

Table 4.12-12: Typical Construction Equipment Vibration Levels lists vibration levels at 25 feet and 40 feet for typical construction equipment. Groundborne vibration generated by construction equipment spreads through the ground and diminishes in magnitude with increases in distance. Based on FTA data, vibration velocities from typical heavy construction equipment operations that would be used during Project construction range from 0.003 to 0.089 in/sec PPV at 25 feet from the source of activity.

Table 4.12-12: Typical Construction Equipment Vibration Levels

Equipment	Peak Particle Velocity at 25 Feet (in/sec)	Peak Particle Velocity at 40 Feet (in/sec)[1]
Large Bulldozer	0.089	0.044
Caisson Drilling	0.089	0.044
Loaded Trucks	0.076	0.038
Jackhammer	0.035	0.017
Small Bulldozer/Tractors	0.003	0.002

Calculated using the following formula: $PPV_{equip} = PPV_{ref} \times (25/D)^{1.5}$

where: PPV_{equip} = the peak particle velocity in in/sec of the equipment adjusted for the distance
PPV_{ref} = the reference vibration level in in/sec from Table 7-4 of the Federal Transit Administration, *Transit Noise and Vibration Impact Assessment Manual*, 2018.
D = the distance from the equipment to the receiver.

Source: Federal Transit Administration. 2018. Transit Noise and Vibration Impact Assessment Manual.

As shown in **Table 4.12-12**, at 40 feet the vibration velocities from construction equipment would range from 0.002 to 0.044 in/sec PPV from the source of activity, which is below the FTA's 0.50 PPV criterion for industrial buildings and the human annoyance criterion of 0.4 in/sec PPV. It can reasonably be assumed that at any further distance, the vibration levels would attenuate further. It is also acknowledged that

construction activities would occur throughout the project site and would not be concentrated at the point closest to the nearest structure. Therefore, vibration impacts would be less than significant and no mitigation is required.

4.12.8 Cumulative Impacts

Construction-related noise is a localized activity and would only affect land uses that are immediately adjacent to the construction areas due to the fact that noise dissipates as it travels away from its source. Noise by definition is a localized phenomenon and drastically reduces as distance from the source increases. Cumulative noise impacts involve development of the proposed Project in combination with ambient growth and other related development projects. As noise levels decrease as distance from the source increases, only projects in the nearby area could combine with the proposed Project to potentially result in cumulative noise impacts.

Cumulative Construction Noise

The Project's construction activities would not result in a substantial temporary increase in ambient noise levels. Construction noise would be periodic and temporary noise impacts that would cease upon completion of construction activities. The Project would contribute to other proximate construction project noise impacts if construction activities were conducted concurrently. However, based on the noise analysis above, the Project's construction-related noise impacts would be less than significant following the City of Rialto Municipal Code.

Construction activities at other planned and approved projects near the project site would be required to comply with applicable City rules related to noise and would take place during daytime hours on the days permitted by the applicable Municipal Code, and projects requiring discretionary City approvals would be required to evaluate construction noise impacts, comply with the City's standard conditions of approval, and implement mitigation, if necessary, to minimize noise impacts. Construction noise impacts are by nature localized. Based on the fact that noise dissipates as it travels away from its source, noise impacts would be limited to the project site and vicinity. Therefore, Project construction would not result in a cumulatively considerable contribution to significant cumulative impacts, assuming such a cumulative impact existed. Impacts would not be cumulatively considerable and no mitigation is required.

Cumulative Operational Noise

Cumulative noise impacts describe how much noise levels are projected to increase over existing conditions with the development of the proposed Project and other foreseeable projects. Cumulative noise impacts would occur primarily as a result of the project-generated traffic on local roadways in combination with cumulative projects in the vicinity. However, noise from generators and other stationary sources could also generate cumulative noise levels.

Cumulative Stationary Noise. As discussed above, impacts from the Project's operational stationary noise would be less than significant. Due to site distance, intervening land uses, and the fact that noise dissipates as it travels away from its source, noise impacts from on-site activities and other stationary sources would be limited to the project site and vicinity. No known past, present, or reasonably foreseeable projects would compound or increase the operational noise levels generated by the Project. Therefore, cumulative operational noise impacts from related projects, in conjunction with Project-specific noise impacts, would not be cumulatively significant.

Cumulative Off-Site Traffic Noise. The cumulative mobile noise analysis is conducted in a two-step process. First, the combined effects from both the Project and other projects are compared. Second, for combined effects that are determined to be cumulatively significant, the Project's incremental effects are then analyzed. A project's contribution to a cumulative traffic noise increase would be considered significant when the combined effect exceeds perception level (i.e., auditory level increase) threshold. The combined effect compares the "Cumulative With Project" condition to "Existing" conditions. This comparison accounts for the traffic noise increase generated by the Project combined with the traffic noise increase generated by cumulative projects.

The following criteria is used to evaluate the combined effect of the cumulative noise increase.

- **Combined Effect**. The cumulative with Project noise level ("Cumulative With Project") would cause a significant cumulative impact if a 3.0 dB increase over "Existing" conditions occurs and the resulting noise level exceeds the applicable exterior standard at a sensitive use.

Although there may be a significant noise increase due to the Project in combination with identified cumulative projects (combined effects), it must also be demonstrated that the Project has an incremental effect. In other words, a significant portion of the noise increase must be due to the Project. The following criteria have been utilized to evaluate the incremental effect of the cumulative noise increase.

- **Incremental Effects**. The "Cumulative With Project" causes a 1.0 dBA increase in noise over the "Cumulative Without Project" noise level.

A significant impact would result only if both the combined and incremental effects criteria have been exceeded. Noise by definition is a localized phenomenon and reduces as distance from the source increases. Consequently, only the proposed Project and growth due to occur in the general area would contribute to cumulative noise impacts. **Table 4.12-13: Cumulative Plus Project Buildout Conditions Traffic Noise Levels** identifies the traffic noise effects along roadway segments in the vicinity of the project site for "Existing," "Cumulative Without Project," and "Cumulative With Project," conditions, and net cumulative impacts.

Table 4.12-13: Cumulative Plus Project Buildout Conditions Traffic Noise Levels

	CNEL @ 100 feet from the Centerline			Combined Effects	Incremental Effects	
Roadway Segment	Existing	Cumulative Without Project	Cumulative With Project	dBA Difference: Existing and Cumulative With Project	dBA Difference: Cumulative Without and With Project	Cumulatively Significant Impact?
Locust Avenue, between Lowell Street and Persimmon Avenue	68.9	69.5	70.7	1.8	1.2	No
Casmalia St, between Locust Avenue and Laurel Avenue	70.5	71.3	72.0	1.5	0.8	No
Riverside Avenue, between Alder Avenue and Locust Avenue	68.3	68.5	69.1	0.8	0.6	No

ADT = average daily trips; dBA = A-weighted decibels; CNEL = Community Noise Equivalent Level;
1. Traffic noise levels are 100 feet from the roadway centerline. The actual sound level at any receptor location is dependent upon such factors as the source-to-receptor distance and the presence of intervening structures, barriers, and topography.

Source: Based on traffic data from **Appendix J**; see **Appendix I** for traffic noise modeling assumptions and results.

First, it must be determined whether the "Cumulative With Project" 3.0 dB increase above existing conditions (*Combined Effects*) is exceeded. Next, under the *Incremental Effects* criteria, cumulative noise impacts are defined by determining if the forecast ambient ("Cumulative Without Project") noise level is increased by 1.0 dB or more. As shown in **Table 4.12-13**, the Incremental Effects criterion (1.0 dB) is exceeded along Locust Avenue (between Lowell Street to Persimmon Avenue); however, the Combined Effects criterion (3.0 dB) is not exceeded. Therefore, the Project would not exceed both the combined and incremental effects criteria along any of the surrounding roadways. Therefore, the Project, in combination with cumulative background traffic noise levels, would result in a less than significant cumulative impact. The Project's contribution to traffic noise would not be cumulatively considerable and no mitigation is required.

4.12.9 Mitigation Program

Standard Conditions

No standard conditions are applicable.

Mitigation Measures

MM NOI-1: **Noise Shielding and Muffling.** Power construction equipment (including combustion engines), fixed or mobile, shall be equipped with noise shielding and muffling devices consistent with manufacturers' standards or the Best Available Control Technology, which achieve a noise reduction of 10 dBA or greater. All equipment shall be properly maintained, and the Applicant or Owner shall require any construction contractor to keep documentation on site during any earthwork or construction activities demonstrating that the equipment has been maintained in accordance with manufacturer's specifications.

4.12.10 Level of Significance After Mitigation

Potential impacts related to noise would be reduced to a level considered less than significant after implementation of the specified mitigation set forth in this section.

4.13 POPULATION AND HOUSING

4.13.1 Introduction

This section of the EIR provides contextual background information on potential impacts on population growth and housing (either directly or indirectly) resulting from Project implementation in the City of Rialto (City). The analysis is based on data in the City's General Plan and data available from the California Department of Finance (DOF) and Southern California Association of Governments (SCAG).

4.13.2 Regulatory Setting

State Regulations

California Housing Element Law

The Housing Element is one of the General Plan elements that are mandated by the State of California (California Government Code §§ 65580 to 65589.8). California State law requires that the Housing Element provides "an identification and analysis of existing and projected housing needs and a statement of goals, policies, quantified objectives, financial resources, and scheduled programs for the preservation, improvement, and development of housing" (Government Code § 65580).

State law requires that each city and county identify and analyze existing and forecasted housing needs within its jurisdiction and prepare goals, policies, and programs to further the development, improvement, and preservation of housing for all economic segments of the community, commensurate with local housing needs.

Regional and Local Regulations

Southern California Association of Governments

SCAG is a Joint Powers Agency established under Sections 6502 et seq. of the California Government Code. SCAG is designated as a Council of Governments (COG), a Regional Transportation Planning Agency (RTPA), and a Metropolitan Planning Organization (MPO) for the six-county region of San Bernardino, Los Angeles, Ventura, Orange, Riverside, and Imperial counties. The region encompasses a population exceeding 19 million persons in an area comprised of more than 38,000 square miles. As the designated MPO, SCAG is the responsible agency for developing and adopting regional housing, population, and employment growth forecasts for local governments. Rialto is a member of the SCAG Regional Council District 8.

SCAG's demographic data is developed to enable the proper planning of infrastructure and facilities to adequately meet the needs of anticipated growth in the region. In April 2024, SCAG adopted Connect SoCal 2024, its 2024 - 2050 *Regional Transportation Plan/Sustainable Communities Strategy* (2024 RTP/SCS). The 2024 RTP/SCS plan base year is 2019 and the horizon year is 2050. Major themes in the 2024 RTP/SCS include integrating strategies for land use and transportation; striving for sustainability; protecting and preserving existing transportation infrastructure; increase capacity through improved systems managements; providing more transportation choices; leveraging technology; responding to demographic and housing market changes; supporting commerce, economic growth and opportunity; promoting the links between public health, environmental protection and economic opportunity; and incorporating the principles of social equity and environmental justice into the plan.

Growth forecasts contained in the 2024 RTP/SCS for the County of San Bernardino County and the City are used as the basis of analysis for housing, population, and employment forecasts.

Regional Housing Needs Assessment

The Regional Housing Needs Assessment (RHNA) is an assessment process performed periodically as part of General Plan Housing Element updates at the local level. The RHNA process begins with the California Department of Housing and Community Development's projection of future statewide housing growth need, and the apportionment of this need to regional COGs throughout the State. SCAG is the COG responsible for developing "fair share" allocation methodology to distribute the region's assigned share of statewide need to cities and counties in the region.[1] California Government Code Section 65583 sets forth the specific content requirements of a jurisdiction's Housing Element. Included in these requirements are obligations on the part of local jurisdictions to provide their "fair share" of regional housing needs (its RHNA allocation) at all income levels. Regional growth needs are defined as the number of units that would have to be added in each jurisdiction to accommodate the forecasted number of households, as well as the number of units that need to be added to compensate for anticipated demolitions and changes to achieve an ideal vacancy rate. SCAG defines a "household" as an occupied dwelling unit.

The RHNA 6th Cycle planning period is 2021-2029. The housing construction need is determined for four broad household income categories: very low (households making less than 50% of area median income), low (50 to 80% of area median income), moderate (80 to 120% of area median income), and above moderate (more than 120% of area median income). The intent of the future needs allocation by income groups is to relieve the undue concentrations of very low-income and low-income households in a single jurisdiction and to help allocate resources in a fair and equitable manner.[1] For the 2021-2029 planning period, the City is required to meet the RHNA number of 8,272 housing units. [2] The Housing Element is required to identify potential candidate housing sites by income category to meet the City's RHNA allocation. The City's 2021-2029 Housing Element was adopted by the City on March 11, 2022.

Rialto General Plan

The City's General Plan is a long-range planning document that puts forward a path for realizing the community's vision through specific goals and policies. The General Plan includes the City's 2021-2029 Housing Element which provides goals and policies specifically associated with housing. The General Plan provides a framework for action and direction for the physical development of the City until 2040. The following housing goals are identified in the 2021-2029 Housing Element.

Goal 1 Maintain and improve the quality of existing housing and neighborhoods in Rialto.

Goal 2 Promote and encourage housing development that adequately meets the needs of all socioeconomic segments of the community and region.

Goal 3 Maximize the use of available financial resources and pursue creative and resourceful methods to reduce the overall cost of housing.

Goal 4 Alleviate potential governmental constraints to housing production and affordability.

Goal 5 Promote equal opportunity for all residents to reside in the housing of their choice.

Rialto Airport Specific Plan

The Rialto Airport Specific Plan was adopted by the City in November 1997. The Rialto Municipal Airport ceased operations in 2014 and the former airport property and many of the properties adjacent to the Rialto Municipal Airport that were suited to accommodate development were removed from the Rialto Airport Specific Plan and incorporated into the Renaissance Specific Plan, which was adopted by the City in 2010. Although the Rialto Municipal Airport is no longer operational, the Rialto Airport Specific Plan serves as the zoning ordinance for parcels that were not removed; these parcels are primarily northwest, west, and east of the former Rialto Municipal Airport. The Rialto Airport Specific Plan also provides a framework to guide future land use and development decisions in this area. The Rialto Airport Specific Plan does not contain specific policies related to population growth or housing.

4.13.3 Existing Conditions

Existing Regional and Local Population

Table 4.13-1: City and County Population Projections identifies the increase of population growth in the County and City for 2019 (i.e., 2024 RTP/SCS base plan year), 2024, and 2050 (i.e., 2024 RTP/SCS horizon year). According to the DOF and SCAG's 2024 RTP/SCS, the County has a population of approximately 2,181,433 residents. The City has a population of approximately 103,097 residents.

Table 4.13-1: County and City Population Projections

Location	2019 Population[1]	2024 Population[2]	2050 Population[1]	Projected population increase (2019 to 2050)	% Change (2019 to 2050)
San Bernardino County	2,175,000	2,181,433	2,623,000	448,000	21%
City of Rialto	103,700	103,097	100,736[3]	-2,964	-3%

Sources:

Accessed September 17, 2024. City projected 2050 population estimate derived using the San Bernardino County-level persons per household ratio (i.e., 2.75 persons per household) and applying it to the City's projected 2050 households (i.e., 36,600 units).
2. State of California, Department of Finance. *E-5 Population and Housing Estimates for Cities, Counties and the State — January 1, 2020-2024*. Retrieved from: Demographics | Department of Finance. Accessed September 17, 2024. City projected 2050 population estimate derived using the San Bernardino County-level persons per household ratio (i.e., 2.75 persons per household) and applying it to the City's projected 2050 households (i.e., 36,600 units).

Existing Regional and Local Housing

Table 4.13-2: County and City Housing Data identifies the total housing units (Total/Occupied) plus vacancy rate and persons per household in the County and City for 2019 (i.e., 2024 RTP/SCS base plan year) and 2024 using DOF estimates. According to the DOF data, both the County and City have seen an increase in total and occupied housing units and a decrease in population household numbers. However, while the County has seen an increase in vacancy rate, the City has seen a decrease from 2019 to 2024.

Table 4.13-2: County and City Housing Data

Location	Total Units		Occupied Units		Vacancy Rate		Persons/ Household	
	2019[1]	2024[2]	2019[1]	2024[2]	2019[1]	2024[2]	2019[1]	2024[2]
San Bernardino County	723,783	753,826	642,806	688,088	9.1%	11.2%	3.31	3.12
City of Rialto	27,553	28,523	25,749	27,863	6.6%	2.3%	3.97	3.68

City of Rialto

SCAG determines total housing needs for each community in Southern California based on three general factors: (1) the number of housing units needed to accommodate future population and employment growth; (2) the number of additional units needed to allow for housing vacancies; and (3) the number of very low, low, moderate, and above moderate-income units needed in the community. Additional factors used to determine the RHNA include tenure, the average rate of units needed to replace housing units demolished, and other factors. Based on DOF data (2024), the City has 28,523 housing units with an average of 3.68 persons per household. The vacancy rate is 2.3 percent (see **Table 4.13-2**). There is no existing residential development on the project site.

Existing Regional and Local Employment

Table 4.13-3: County and City Labor Force Data identifies the total labor force and employment and unemployment rates for the County and City for in the County and City for 2019 (i.e., 2024 RTP/SCS base plan year) and 2023 using DOF estimates. Because COVID-19 resulted in decreased employment for both the County and City, statistical information for 2020 was not used. Additionally, DOF 2024 annual average estimates are not available, therefore DOF 2023 annual average estimates are used in this analysis. According to the State of California Employment Development Department (EDD), between 2019 and 2023, the labor force and the number of employed persons decreased in both the County and City.

Table 4.13-3: County and City Labor Force Data

Location	Labor Force		Employment		Unemployment		Employment Change
	2019[1]	2023[2]	2019[1]	2023[2]	2019[1]	2023[2]	
San Bernardino County	965,400	1,013,700	928,100	966,500	37,400	47,200	-4.1%
City of Rialto	44,700	46,900	42,600	44,500	2,000	2,400	-4.5%

Jobs to Housing Balance

The economic analysis conducted for SCAG's 2024 RTP/SCS shows the following regional employment growth:

- Job growth from building, operating, and maintaining the 2024 RTP infrastructure projects, averaging over 279,000 jobs per year; and
- Increases in economic competitiveness, efficiency, and amenities from the completion of the projects and operations, averaging over 465,000 jobs per year.

In terms of the jobs to housing balance, the SCAG Rialto 2019 Local Profiles Report identified that 7.6 percent of City residents work within the City, while 92.4 percent commute to places of employment outside the City. The 2024 RTP/SCS aims to balance the region's future mobility and housing needs with economic, environmental, and public health goals.

4.13.4 Methodology

The proposed Project is evaluated against the significance criteria below, as the basis for determining the impact's level of significance concerning population and housing. In addition, this analysis considers the existing regulatory framework (i.e., laws and standards) that avoid or reduce the potentially significant environmental impact. Where significant impacts remain despite compliance with the regulatory framework, feasible mitigation measures are recommended, where warranted, to avoid or reduce the Project's potentially significant environmental impacts.

4.13.5 Thresholds of Significance

The following significance criteria for population and housing impacts were derived from the Environmental Checklist in CEQA Guidelines Appendix G. The proposed Project would result in a significant impact related to population and housing if it would:

- Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure).

As addressed in **Section 5.1: Effects Found Not to be Significant,** the City has determined that the proposed Project would not have a significant impact on the following threshold for the reasons stated below, and that no further analysis is required in the EIR:

- Would the Project displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?

The project site is vacant; there is no housing on the site. Therefore, Project implementation would not create an impact that would displace people or housing.

4.13.6 Project Impacts and Mitigation

Threshold 4.13-1:	**Would the Project induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?**
	Level of Significance: Less than Significant Impact

The proposed Project is consistent with the General Industrial General Plan land use designation and the Rialto Airport Specific Plan General Manufacturing land use designation. Project implementation would allow for the construction and operation of a warehouse building, which is a permitted use in the General Manufacturing land use designation.

Employment opportunities would be provided both during the construction of the Project and once the Project is operational. The number of temporary construction jobs that would be created is unknown. With respect to long-term employment opportunities, the proposed Project would employ approximately 557 employees, based on an employment generation factor of one employee per 1,195 sf of warehouse use (664,859 sf/1,195 sf = 556.4, rounded up to 557).[3] As discussed above, approximately 92.4 percent of Rialto residents travel outside of the City for work. Given the high percentage of City residents commuting outside the City for employment and the opportunity to reduce local unemployment rates, the addition of new jobs as a result of the Project would likely be filled by the local labor market. As a result, the increase in new jobs would not induce substantial population growth.

The proposed Project is consistent with the General Plan and Specific Plan designations for the site, meaning that future growth associated with Project implementation has already been accounted for in the General Plan and General Plan EIR. Therefore, the increase in employment opportunities at the project site and potential increase of new workers moving into the City are not considered substantial or unplanned.

The Project proposes three new driveways on Lowell Street, one driveway on Locust Avenue, and one emergency vehicle only driveway on Lake Padden Lane. These improvements would allow for passenger vehicle and truck access to the project site and would not result in the extension of a roadway or infrastructure that would directly or indirectly induce unplanned population growth on or near the project site. Therefore, the Project would not induce substantial unplanned population. Impacts would be less than significant and mitigation is not required.

4.13.7 Cumulative Impacts

Potential cumulative population and housing impacts are assessed relative to the Airport Specific Plan, General Plan, and regional plans, including SCAG's 2024 RTP/SCS population, housing, and employment projections. SCAG's regional growth projections reflect recent and past trends, key demographic and economic assumptions and include local and regional policies. Local jurisdictions participate in the growth forecast development process.

Cumulative impacts would occur if development on the project site, together with other cumulative projects would induce substantial unplanned population growth or displace substantial numbers of existing people or housing. As discussed above, the Project is consistent with the General Industrial

[3] Natelson Company, Inc. 2001. *Employment Density Study Summary Report Prepared for SCAG, Table 8A.*

General Plan land use designation and Rialto Airport Specific Plan's General Manufacturing zoning designation and therefore does not conflict with the City's 2021-2029 Housing Element goals. Further, the proposed Project would not result in significant direct, or indirect permanent or temporary impacts related to population or housing because the Project is consistent with the City's land use and zoning and the off-site improvements that would be implemented as a part of the Project would not extend roadways or infrastructure that would directly or indirectly induce unplanned population growth on or near the project site. Future development projects would also be subject to project-level review and project-specific measures would be required, as needed, to reduce significant impacts. Therefore, the proposed Project would not result in incrementally significant effects to population or housing that could be compounded or increased when considered together with similar effects from other cumulative present and reasonably foreseeable probable future projects. Given the Project's consistency with land use and zoning, as well as the potential for other projects to be generally consistent with the City's population and housing policies, the Project would not result in significant population and housing impacts, and therefore, taken with past, present, and reasonably foreseeable future projects, Project impacts are not considered cumulatively considerable and no mitigation is required.

4.13.8 Mitigation Program

Standard Conditions

No standard conditions are applicable.

Mitigation Measures

No mitigation is required.

4.13.9 Level of Significance After Mitigation

No significant population and housing resource impacts have been identified; no mitigation is required.

4.14 PUBLIC SERVICES

4.14.1 Introduction

This section of the EIR describes existing public services for the project area and identifies and addresses potential Project impacts related to fire and police protection services provided by the City of Rialto (City).

4.14.2 Regulatory Setting

Federal Regulations

Federal Emergency Management Act (FEMA)

In March 2003, FEMA became part of the U.S. Department of Homeland Security. FEMA's continuing mission is to lead the effort to prepare the nation for all hazards and effectively manage federal response and recovery efforts following any national incident. FEMA also initiates proactive mitigation activities, trains first responders, and manages the National Flood Insurance Program and the U.S. Fire Administration.

Federal Fire Safety Act (FFSA)

The 1992 FFSA is different from other laws affecting fire safety as the law applies to federal operations, and there is no requirement for local action unless a private building owner leases space to the federal government. The FFSA requires federal agencies to provide sprinkler protection in any building, whether owned or leased by the federal government, which has at least 25 federal employees during the course of their employment.

Occupational Safety and Health Administration (OSHA)

OSHA's mission is to "assure America's workers have safe and healthful working conditions free from unlawful retaliation. OSHA carries out its mission by setting and enforcing standards; enforcing anti-retaliation provisions of the OSH Act and other federal whistleblower laws; providing and supporting training, outreach, education, and assistance; and working collaboratively with our state OSHA programs as well as ensuring that they are at least as effective as federal OSHA, furthering a national system of worker safety and health protections." The agency is also charged with enforcing a variety of whistleblower statutes and regulations.

OSHA: Emergency Action Plan. Developments are required under OSHA standards to prepare an emergency action plan that is kept in the workplace that provides procedures for reporting a fire or other emergency, emergency evacuation, including type of evacuation and exit route assignments, and to be followed by all employees. Employers are required to have and maintain an employee alarm system, provide training, and review the emergency action plan with each employee covered by the plan.

OSHA: Fire Prevention Plan. Developments are required under OSHA standards to prepare a fire prevention plan that at minimum must include procedures to control accumulations of flammable and combustible waste materials, and for regular maintenance of safeguards installed on heat-producing equipment to prevent the accidental ignition of combustible materials. Furthermore, the fire prevention plan must contain the names and/or job titles of employees responsible for maintaining equipment to prevent or control sources of ignition or fires, and for the control of fuel source hazards.

Disaster Mitigation Act of 2000

The Disaster Mitigation Act (DMA) of 2000 is a federal law that amended the Robert T. Stafford Disaster Relief and Emergency Assistance Act (Stafford Act). The DMA was signed into law on October 30, 2000, after being introduced by Representative Tillie Fowler (R-FL-4) on February 11, 1999. The DMA's goals include reducing injuries, loss of life, and property damage; helping communities understand and reduce their vulnerability to natural hazards; using a more proactive planning process; and developing more effective hazard mitigation plans.

State Regulations

California Public Resources Code 4290 and 4291

These regulations, which implement minimum fire safety standards related to defensible space, apply to the perimeters and access to all commercial, industrial, and residential building construction within a State Responsibility Area approved after January 1, 1991, and within lands classified and designated as a Very High Fire Hazard Severity Zone (VHFHSZ) after July 1, 2021. The person(s) who control, lease, maintain, operate, or own said building in, upon, or adjoining a mountainous area, forest-covered lands, brush-covered lands, grass-covered lands, or land that is covered with flammable materials is required to preserve a defensible space of 100 feet from the perimeter of the building. The regulations include the following:

1. Road standards for fire equipment access.
2. Standards for signs identifying streets, roads, and buildings.
3. Minimum private water supply reserves for emergency fire use.
4. Fuel breaks and greenbelts.

These regulations do not supersede local regulations which equal or exceed minimum regulations adopted by the State.

California Building Code

The State of California provides a minimum standard for building design through the California Building Code (CBC), which is located in Part 2 of Title 24 of the California Code of Regulations (CCR). The CBC is based on the International Building Code but has been modified for California conditions. It is generally adopted on a jurisdiction-by-jurisdiction basis, subject to further modification based on local conditions. Industrial buildings are plan checked by local city and county building officials for compliance with the CBC. Typical fire safety requirements of the CBC include the installation of sprinklers in all industrial buildings; the establishment of fire resistance standards for fire doors, building materials, and particular types of construction; and the clearance of debris and vegetation within a prescribed distance from occupied structures in wildfire hazard areas.

California Fire Code

The California Code of Regulations (CCR) Title 24, Part 9 (California Fire Code) contains regulations for the construction and maintenance of buildings, the use of premises, and the management of Wildland-Urban Interface areas, among other issues. The California Fire Code is updated every three years by the California Building Standards Commission and was last updated in 2022 (effective January 1, 2023). The Fire Code sets forth regulations regarding building standards, fire protection and notification systems, fire protection devices such as fire extinguishers and smoke alarms, high-rise building standards, and fire

suppression training. It contains regulations relating to construction, maintenance, and use of buildings. Topics addressed in the code also include fire department access, fire hydrants, automatic sprinkler systems, fire alarm systems, fire and explosion hazards safety, hazardous materials storage and use, provisions intended to protect and assist fire responders, industrial processes, and many other general and specialized fire safety requirements for new and existing buildings and the surrounding premises.

Emergency Mutual Aid Agreements

The Emergency Mutual Aid Agreements (EMAA) system is a collaborative effort between city and county emergency managers in the Office of Emergency Services in the coastal, southern, and inland regions of the State. EMAA provides service in the emergency response and recovery efforts at the Southern Regional Emergency Operations Center, local Emergency Operations Centers, the Disaster Field Office, and community service centers. The purpose of EMAA is to support disaster operations in affected jurisdictions by providing professional emergency management personnel. In accordance with the EMAA, local and State emergency managers have responded in support of each other under a variety of plans and procedures. San Bernardino County, including the City of Rialto, is in Region VI, which also includes San Diego, Imperial, Inyo, Mono, and Riverside counties.

Mitigation Fee Act (California Government Code (Sections 66000 through 66008))

Enacted as Assembly Bill (AB) 1600, the Mitigation Fee Act requires a local agency, such as the City of Rialto, establishing, increasing, or imposing an impact fee as a condition of development to identify the purpose of the fee and the use to which the fee is to be put. The local agency must also demonstrate a reasonable relationship between the fee and the purpose for which it is charged, and between the fee and the type of development project on which it is to be levied. The Mitigation Fee Act became enforceable on January 1, 1989.

Section 35 of Article XIII of the California Constitution Subdivision (a)(2)

Section 35 of Article XIII of the California Constitution subdivision (a)(2) identifies that the protection of the public safety is the first responsibility of local government and local officials have an obligation to give priority to the provision of adequate public safety services.

Local Regulations

Rialto General Plan

The General Plan Chapter 5, *Safety and Noise Element* identifies goals related to fire and police protection. The following list includes General Plan goals and policies that have been adopted by the City for the purpose of avoiding or mitigating an environmental effect and are applicable to the proposed Project:

Goal 5-1 **Continue to build the City's fire protection and prevention programs and requirements to minimize fire hazards.**

Policy 5-1.3 Require that all site plans, subdivision plans, and building plans be reviewed by the Fire Department to ensure compliance with appropriate fire regulations, such as California Fire Safe Regulations.

Goal 5-8 **Ensure that first responders and the Emergency Operations Center (EOC) have adequate capacity to respond to hazard events.**

Policy 5-8.7 Require that development be phased in relation to the City's ability to provide an adequate level of fire protection, pursuant to the City standard of cover and fire department strategic plan.

Goal 5-10 **Provide effective, timely and comprehensive policing services that meet the safety needs of Rialto.**

Policy 5-10.3 Continue to encourage design concepts that inhibit and discourage criminal behavior such as Crime Prevention Through Environmental Design (CPTED) techniques.

Rialto Airport Specific Plan

The Rialto Airport Specific Plan was adopted by the City in November 1997. The Rialto Municipal Airport ceased operations in 2014 and the former airport property and many of the properties adjacent to the Rialto Municipal Airport that were suited to accommodate development were removed from the Rialto Airport Specific Plan and incorporated into the Renaissance Specific Plan, which was adopted by the City in 2010. Although the Rialto Municipal Airport is no longer operational, the Rialto Airport Specific Plan serves as the zoning ordinance for parcels that were not removed; these parcels are primarily northwest, west, and east of the former Rialto Municipal Airport. The Rialto Airport Specific Plan also provides a framework to guide future land use and development decisions in this area. The Rialto Airport Specific Plan does not contain specific policies related to fire and police protection.

City of Rialto Municipal Code

Title 3: Revenue and Finance. The California Mitigation Fee Act (California Government Code, §§ 66000 et seq.) mandates procedures for administration of impact fee programs, including collection and accounting, reporting, and refunds. A development impact fee is a monetary exaction other than a tax or special assessment that is charged by a local governmental agency to an applicant in connection with approval of a development project for the purpose of defraying all or a portion of the cost of public facilities related to the development project.

The City has adopted development impact fee programs for various public facilities, which are codified under Rialto Municipal Code Chapter 3.33. Rialto Municipal Code Chapter 3.33 – Development Impact Fees establishes every fee that every person or development must comply with (if applicable) regarding utility, community and recreation center impacts, library, animal center impacts, police impacts, park in-lieu/park impacts, and fire protection fees, etc.

Title 18: Zoning. The purpose and intent of Rialto Municipal Code Title 18 -Zoning Code is to set standards and guidelines for the City to lessen congestion in the streets; to secure safety from fire, panic and other dangers; to promote health and the general welfare; to provide adequate light and air; to prevent the overcrowding of land; to avoid undue concentration of population; to facilitate the adequate provision of transportation, water, sewerage, schools, parks and other public requirements.

Title 15, Chapter 15.28: Fire Code. The City of Rialto Fire Code is codified under Rialto Municipal Code Chapter 15.28 – Fire Code. The City has adopted and amended the California Fire Code as permitted by Health and Safety Code Section 17958 and Government Code Section 50022. The City's Fire Code identifies methods for calculating required fire flow, hydrant placement and other requirements considered in building and site design. The Rialto Fire Department reviews plans for proposed development projects to ensure compliance with the City's Fire Code.

Emergency Response

Procedures for mitigating emergency events, such as such wildfires, floods, windstorms, hazardous materials releases, civil disturbance, and earthquakes are outlined in the City's Standard Emergency Management System (SEMS) Multi-Hazard Functional Plan (MHFP). The MHFP incorporates and coordinates all the facilities and personnel of the City into an efficient organization capable of responding to any emergency.

4.14.3 Existing Conditions

Fire Protection

FHSZs are mapped by the California Department of Forestry and Fire Protection (CAL FIRE) as set forth in Public Resources Code Sections 4201-4204 and Government Code Sections 51175-51189. FHSZs are categorized as fire protection within a Federal Responsibility Area under the jurisdiction of a federal agency, a State Responsibility Area under the jurisdiction of CAL FIRE, or within a Local Responsibility Area under the jurisdiction of a local agency. CAL FIRE is responsible for fire protection within State Responsibility Areas, which are found in 56 counties in California, and provides a variety of emergency services in 36 counties.

CAL FIRE defines a State Responsibility Area as land that is not federally owned, not incorporated, does not exceed a housing density of three units per acre, contains wildland vegetation as opposed to agriculture or ornamentals, and has watershed value and/or has range/forage value (this effectively eliminates most desert lands). Where local fire protection agencies, such as the Rialto Fire Department, are responsible for wildfire protection, the land is classified as a Local Responsibility Area. The project site and adjacent areas are classified as a Non-Very High Fire Hazard Severity Zone (Non-VHFHSZ).

The Rialto Fire Department provides fire protection services for the City. Led by a Fire Chief, the Fire Department has a Division Chief, two Battalion Chiefs, an Emergency Medical Services Coordinator, and a Fire Marshall. The Fire Department deploys from five fire stations staffed 24 hours per day by firefighters and non-safety ambulance operators. Daily emergency medical service and fire/rescue staffing consists of one Battalion Chief, four engine companies, one truck company, and four paramedic ambulances. The closest fire station to the project site is Station 204, located at 3288 Alder Avenue, approximately 1.2 miles north of the project site. There is one fire hydrant located at the southeast corner of Locust Avenue at Lowell Street.

Administration. The Rialto Fire Department Administration provides oversight to all department operations including project development, budgeting, development of policy and protocol, personnel development, and strategic planning to ensure highly effective fire and life safety services. Fire Administration is staffed by the Fire Chief with an Executive Assistant, a Division Chief of Operations, Administrative Battalion Chief, and one office specialist.

Rialto Fire Prevention Division. The Rialto Fire Prevention Division engages in community risk reduction services through code compliance, plan review, public education, inspection, emergency preparedness and targeted risk-specific programs.

Ambulance Operator Program. The Rialto Fire Department has provided ambulance transportation services since 1971 using a model of deployment that includes staffing of ambulances with firefighters that are cross-trained as Paramedics and Emergency Medical Technicians. Based on service demand and

cost of deployment, the current ambulance staffing model is being retooled to include single function, paramedic and Ambulance Operators to staff city-owned ambulances.

Rialto Fire Department Emergency Medical Service. The Rialto Emergency Medical Service is responsible for the planning, compliance, review, and oversight for the provisions of clinical medical care provided by the Rialto Fire Department. The Fire Department staffs one paramedic for all fire engines, trucks, and ambulances; all other positions are staffed by Emergency Medical Technicians.

Incident Response

Fire service deployment is about the speed and weight of the response. Speed refers to initial response (first due) of all-risk intervention resources (engines, ladder trucks, and squads) strategically deployed across a jurisdiction for response to emergencies within a time interval to facilitate desired outcomes. Weight refers to multiple-unit Effective Response Force (commonly referred to as a First Alarm) responses to more serious emergencies, such as building fires, multiple-patient medical emergencies, vehicle collisions with extrication required, or technical rescue incidents. In these situations, a sufficient number of firefighters must be assembled within a reasonable time interval to safely control the emergency and prevent it escalating into a more serious event. The Rialto Fire Department responded to a monthly average of 939 incidents in 2023.[1]

Police Protection

The Rialto Police Department provides law enforcement and police protection services throughout the City. The Police Department headquarters is located at 128 North Willow Avenue, approximately 5.8 miles southeast of the project site. With 176 employees, the Police Department is a full-service law enforcement agency that is charged with the enforcement of local, State, and federal laws, and with providing 24-hour protection. Operations within the Rialto Police Department are organized within divisions — Operations, Support Services, and Professional Standards — with bureaus, teams and units, and programs within each division.[2]

The Rialto Police Department participates in the California Law Enforcement Mutual Aid Plan administrated by the Governor's Office of Emergency Services. The law enforcement mutual aid system is an ongoing cooperative effort among law enforcement agencies to ensure an effective and organized response to a wide range of emergencies. Under the Law Enforcement Mutual Aid Plan, the City of Rialto can both provide and request law enforcement resources to and from neighboring jurisdictions. There are seven mutual aid regions in the State and each region is comprised of multiple Operational Areas and has a Regional Law Enforcement Mutual Aid Coordinator. Rialto is located in mutual aid Region VI, which includes the counties of San Bernardino, Mono, Inyo, Riverside, Imperial, and San Diego.

4.14.4 Methodology

The Rialto Fire Department and Rialto Police Department were contacted to determine if the Project would significantly impact the departments' ability to provide fire protection and police protection services. The following analysis considers the existing regulatory framework and available information published by the Rialto Fire Department and Rialto Police Department. Where significant impacts remain

[1] Average was compiled through available monthly report data between May and October 2023. This is the most current published information.

[2] The Rialto Police Department does not have publicly available response time standards or service ratios.

despite compliance with the regulatory framework, feasible mitigation measures are recommended, where warranted, to avoid or reduce the Project's potentially significant environmental impacts.

4.14.5 Thresholds of Significance

The following significance criteria for fire and police impacts were derived from the Environmental Checklist in CEQA Guidelines Appendix G. The proposed Project would result in a significant impact related to fire and police protection if it would:

- Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for fire protection.
- Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which would cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for police protection.

As addressed in **Section 5.1: Effects Found Not to be Significant**, the City has determined that the proposed Project would not have a significant impact on the following threshold for the reasons stated below, and that no further analysis was required:

- Would the Project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services: schools, parks, and other public facilities?

The Project does not propose new or physically altered government facilities, nor would it include residential uses with the potential to create a demand for new or physically altered school, parks, or other public facilities, such as library services. For this reason, no impact would occur and this threshold question is not further addressed in the EIR.

4.14.6 Project Impacts and Mitigation

Threshold 4.14-1:	**Would the Project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for fire protection?**
	Level of Significance: Less than Significant Impact

Fire Protection

The project site is vacant and located in an area currently served by the Rialto Fire Department. Impacts related to fire protection services are assessed by the Rialto Fire Department on a project-by-project basis. In determining the potential impacts to fire protection services that could occur, the Rialto Fire Department considers a project's land use, fire-protection related needs, and a project site's

recommended response distance and time and fire safety requirements, as well as project design features that would reduce the demand for fire protection services.

Construction

During construction, site clearance including vegetation removal would remove potential fuel for fires which could occur during construction. The potential for emergency response incidents related to construction operations would be minimized through compliance with the established regulatory framework, including Cal/OSHA, which ensures that employers provide their workers with a place of employment free from recognized hazards to safety and health, such as exposure to toxic chemicals, excessive noise levels, mechanical dangers, heat or cold stress, or unsanitary conditions.

Project traffic would not result in substantial delays and congestion that would affect the circulation of emergency vehicles in the study area. The Project would not require permanent road closures but would result in temporary partial lane closures during specific construction phases such as connection to utilities in the roadways. SC TRAN-1 in **Section 4.15: Transportation** requires the preparation of a Construction Management Plan to identify planned travel patterns for construction and haul vehicles. These temporary lane closures would not result in the closure of any roadways that would impact the mobility of first responders. The Project would be required to incorporate all applicable design and safety requirements as set forth by the City during construction and operation. Therefore, compliance with the mentioned codes and regulations, and the temporary nature of construction activities would ensure that Project construction would result in less than significant impacts with respect to performance objectives for fire protection services.

Operations

Where local fire protection agencies, such as the Rialto Fire Department, are responsible for wildfire protection, the land is classified as a Local Responsibility Area (LRA). LRAs are incorporated cities, urban regions, agriculture lands, and portions of the desert where the local government is responsible for wildfire protection. The project site and its adjacent areas are classified as a Non-VHFHSZ (non-very high FHSZ).[3]

The proposed Project would conform to the then-current California Building Code and California Fire Code which would require fire suppression systems such as sprinklers and fire curtains. As discussed previously, the City's Fire Code identifies standards for building and site design and fire protection and notification systems. It also contains regulations relating to construction, maintenance, and use of buildings including Fire Department access, automatic sprinkler systems, fire alarm systems, fire and explosion hazards safety, hazardous materials storage and use, provisions intended to protect and assist fire responders, industrial processes, and many other general and specialized fire safety requirements for new and existing buildings and the surrounding premises.

The Project would include 20 fire hydrants located throughout the project site. The fire hydrants would connect to a proposed fire water line loop, which ultimately connects to the water main in Lowell Street. All driveways have been designed to accommodate the required turning radius for fire engines and would not impair emergency fire service access. In accordance with the City's entitlement process, the Rialto Fire Department will review the plot plan to ensure compliance with the City's Fire Code.

[3] CAL FIRE. *Fire Hazard Severity Zones Map*. Retrieved from: https://osfm.fire.ca.gov/what-we-do/community-wildfire-preparedness-and-mitigation/fire-hazard-severity-zones. Accessed April 29, 2025.

Project implementation would incrementally increase the demand for fire protection services. Although the project site is not developed, the project area is already served by the Rialto Fire Department. Therefore, the Project does not include or require construction of any new or physically altered fire station facilities in order to maintain acceptable service ratios, response times or other performance objectives for fire protection. The proposed land use is consistent with the General Plan and zoning assumptions for the site. The Project is not expected to substantially increase service demand such that a new or physically altered facility would need to be constructed in order to maintain acceptable service ratios, response times or other performance objectives for fire protection.

Project plans would be reviewed by applicable City departments to ensure compliance with the Rialto Municipal Code and General Plan as well as all emergency response and fire safety requirements of the Rialto Fire Department and the California Fire Code. Further, the Project would be required to pay all required development impact fees as adopted by City Ordinance No. 1532. Further, development impact fees are paid on a project-by-project basis to ensure a proportionate fair share is contributed toward facilities, equipment, and personnel that would be needed over time to accommodate the additional demand from the Project. Therefore, upon payment of fees, impacts would be considered less than significant. Therefore, compliance with building codes and payment of development impact fees would reduce impact to a less than significant level and no mitigation is required.

Threshold 4.14-2:	**Would the Project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for police protection?** ***Level of Significance:*** Less than Significant Impact

Police Protection

Construction

Impacts to police protection services are assessed based on the ability of police personnel to adequately serve the existing and future population, including residents, workers, and daytime and nighttime visitors and the Police Department's ability to meet the additional demand for protection services with the Project. The project site is in a developed area and is adjacent to existing industrial uses.

During construction, action by the Rialto Police Department could be required in cases of trespassing, theft, or vandalism. Construction would not require road closures but may require temporary lane closures during specific construction phases such as connection to utilities in the roadways. SC TRAN-1 in **Section 4.15: Transportation** requires the preparation of a Construction Management Plan to identify planned travel patterns for construction and haul vehicles. These temporary lane closures would not result in the closure of any roadways that would impact the mobility of first responders. The Project would be required to incorporate all applicable design and safety requirements as set forth by the City during construction and operation. Prior to commencement of construction activities, Project plans would be reviewed by the City to ensure compliance with the City's Municipal Code and General Plan as well as all applicable regulations associated with site signage, lighting, perimeter control, and other crime safety preventative measures. SC PS-1 requires the Applicant to contract with a security service to provide security during construction and may include additional security measures, such as the installation of

temporary fencing. With implementation of these Standard Conditions, impacts to police protection would be less than significant during construction and no mitigation is required.

Operations

Project implementation would result in an increase in employment opportunities, which could incrementally increase the demand for police services. However, since the project site is in a developed area of the City that is already contributing toward the need for police services, the Project is not expected to substantially increase service demand such that a new police station would need to be constructed. SC PS-1 requires that all development plans be evaluated by the Rialto Police Department to ensure that public safety design measures are incorporated into the Project plans. Additionally, the Project is required to pay all required impact fees as adopted by City Ordinance No. 1532. Accordingly, development impact fees are paid on a project-by-project basis to ensure a proportionate fair share is contributed toward facilities, equipment, and personnel that would be needed over time to accommodate the additional demand from the Project. Impacts on service demand and response times for police would be less than significant and no mitigation is required.

4.14.7 Cumulative Impacts

For purposes of public services, cumulative impacts are considered for projects located within the City.

Fire Protection

The Project assumes the provision of fire protection services is based on a combination of existing fire services and the use of mutual aid agreements. Additionally, all present and reasonably foreseeable future projects would be required to pay impact fees as adopted by City Ordinance 1532. As previously addressed, development impact fees are paid on a project-by-project basis to ensure a proportionate fair share is contributed toward facilities, equipment, and personnel that would be needed over time to accommodate the additional demand caused by development. The payment of fees and compliance with applicable regulatory requirements would preclude the Project's cumulative contribution to fire protection impacts and no mitigation is required.

Police Protection

The Police Department's operating budget is primarily generated through tax revenues and fees collected from penalties and requested services, and impact fees as adopted by City Ordinance 1532. Increased property and sales tax from cumulative projects would increase the City's General Fund in rough proportion to population increases, providing funding for any improvements necessary to maintain adequate police protection facilities, equipment, and/or personnel. The payment of fees and compliance with applicable regulatory requirements would preclude the Project's cumulative contribution to police protection impacts. Moreover, should any new or altered facilities be required in the future, these facilities would be subject to separate CEQA review. The Project would not cumulatively contribute to an impact to police protection services and no mitigation is required.

4.14.8 Mitigation Program

Standard Conditions and Requirements

Fire Protection

Please refer to SC TRAN in **Section 4.15: Transportation**.

Police Protection

SC PS-1 Prior to the issuance of the first grading permit and/or action that would permit site disturbance, the Applicant shall provide evidence to the City of Rialto Police Department that a construction security service or equivalent service shall be established at the construction site along with other measures, as identified by the Police Department and the Public Works Department, to be instituted during the grading and construction phase of the Project.

SC PS-2 Prior to issuance of building permits, the City of Rialto Police Department shall review development plans for the incorporation of defensible space concepts to reduce demands on police services. Public safety planning recommendations shall be incorporated into the Project plans. The Applicant shall prepare a list of project features and design components that demonstrate responsiveness to defensible space design concepts. The Police Department shall review and approve all defensible space design features incorporated into the Project prior to initiating the building plan check process.

Mitigation Measures

No mitigation is required for Fire or Police Protection.

4.14.9 Level of Significance After Mitigation

Impacts would be less than significant for Police and Fire Protection services and no mitigation is required.

4.14.10 References

CAL FIRE. 2025. *Fire Hazard Severity Zones Map*. Retrieved from: https://osfm.fire.ca.gov/what-we-do/community-wildfire-preparedness-and-mitigation/fire-hazard-severity-zones. Accessed April 29, 2025.

4.15 TRANSPORTATION

4.15.1 Introduction

This EIR section summarizes the findings of *Locust Gateway Logistics Center Vehicle Miles Traveled Analysis* prepared by Kimley-Horn and Associates, Inc. (Kimley-Horn, 2025) to evaluate the potential transportation impacts associated with the proposed Project. This study has been prepared in accordance with CEQA requirements to evaluate potential transportation impacts based on vehicle miles traveled (VMT). The report is included as **Appendix J** of this EIR.

4.15.2 Regulatory Setting

Federal Regulations

Federal Transportation Improvement Program

The Federal Transportation Improvement Program (FTIP) is a federally mandated four-year program of all surface transportation projects that will receive federal funding or are subject to a federally required action. The FTIP is a comprehensive listing of such transportation projects proposed over a six-year period. As the metropolitan planning organization (MPO) for the region, the Southern California Association of Governments (SCAG) is responsible for developing the FTIP for submittal to the California Department of Transportation (Caltrans) and the federal funding agencies.

The FTIP identifies specific funding sources and fund amounts for each project. It is prioritized to implement the region's overall strategy for providing mobility and improving the efficiency and safety of the transportation system, while supporting efforts to attain federal and State air quality standards for the region by reducing transportation-related air pollution. Projects in the FTIP include highway improvements, transit, rail and bus facilities, high occupancy vehicle (HOV) lanes, high occupancy toll (HOT) lanes, signal synchronization, intersection improvements, freeway ramps, and non-motorized projects - bicycle and pedestrian.

The FTIP must include all federally funded transportation projects in the region, as well as all regionally significant transportation projects for which approval from federal funding agencies is required, regardless of funding source. Projects in the FTIP are consistent with SCAG's approved Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS).

Manual on Uniform Traffic Control Devices

The Federal Highway Administration's (FHWA) Manual on Uniform Traffic Control Devices (MUTCD) is contained in the Code of Federal Regulations (CFR, Title 23, Part 655, Subpart F). The FHWA requires that the most recent MUTCD be adopted by individual states as their legal state standard for traffic-control devices within two years of the update. The MUTCD identifies the standards that should be used to install and maintain traffic-control devices on all public streets, highways, bikeways, and private roads that are open to public traffic. The City of Rialto (City) uses the MUTCD for determining the necessary traffic-control devices (e.g., signs, barricades, gates, warning signs, object markers, guide signs, pavement and curb markings, traffic-control signs, pedestrian control signs, in-roadway lights, and flagger control) on public streets, highways, bikeways, and school areas in the City, including temporary traffic-control devices in and near construction work areas.

State Regulations

Sustainable Communities Strategies: Senate Bill 375 – Land Use Planning

Senate Bill (SB) 375 (2008) provides for a planning process to coordinate land use planning and Regional Transportation Plans (RTPs) and funding priorities in order to help California meet the greenhouse gas (GHG) reduction goals established in Assembly Bill (AB) 32. SB 375 requires that RTPs developed by metropolitan planning organizations (e.g., SCAG) incorporate a "sustainable communities' strategy" in their RTPs that will achieve GHG emission reduction targets set by the California Air Resources Board (CARB). SB 375 also includes provisions for streamlined CEQA review for some infill projects, such as Transit-Oriented Developments (TODs).

Senate Bill 743 – Update to the CEQA Guidelines for Transportation Impacts

The Steinberg Act (SB 743) (also known as the Environmental Act) was enacted in 2013 to shift the focus of transportation analysis from driver delay to reducing GHG emissions, creating multimodal networks, and promoting mixed land uses. SB 743 required the Governor's Office of Planning and Research (OPR) to amend the CEQA Guidelines to provide alternative level of service metrics for transportation impact evaluations. In January 2019, the Natural Resources Agency finalized updates to the CEQA Guidelines including the incorporation of the SB 743 modifications. The CEQA Guidelines shift traffic analysis from delay and operations to vehicle miles traveled (VMT) when evaluating transportation impacts under CEQA. VMT refers to the amount and distance of automobile travel attributable to a project.

Metrics to evaluate transportation impacts may include VMT, VMT per capita, automobile trip generation rates, or automobile trips generated. According to SB 743, projects should aim to reduce VMT and mitigate potential VMT impacts through the implementation of transportation demand management (TDM) strategies. By July 1, 2020, all CEQA lead agencies were required to analyze a project's transportation impacts using VMT. The City adopted their VMT guidelines in 2021.

Regional and Local Regulations

Regional Transportation Plan/Sustainable Communities Strategy

On April 4, 2024, SCAG's Regional Council adopted *2024-2050 Regional Transportation Plan/Sustainable Communities Strategies* (RTP/SCS) or Connect SoCal Plan. On May 10, 2024, the Federal Highway Administration (FHWA) and Federal Transit Administration (FTA) approved Connect SoCal 2024; CARB approved on May 7, 2025. The Connect SoCal Plan is a long-range visioning plan that balances future mobility and housing needs with economic, environmental, and public health goals. It includes a strong commitment to reduce emissions from transportation sources to comply with SB 375, improve public health, and meet the National Ambient Air Quality Standards. This long-range plan, required by the State of California and the federal government, is updated by SCAG every four years as demographic, economic, and policy circumstances change. The RTP/SCS is a living, evolving blueprint for the region's future.

Of the goals presented in Connect SoCal, the following six are applicable to transportation:

- Create human-centered communities in urban, suburban, and rural settings to increase mobility options and reduce travel distances
- Integrate the region's development pattern and transportation network to improve air quality, reduce greenhouse gas emissions and enable more sustainable use of energy and water
- Improve access to jobs and educational resources

- Advance a resilient and efficient goods movement system that supports the economic vitality of the region, attainment of clean air and quality of life for our communities

San Bernardino County Congestion Management Program

The San Bernardino County Transportation Authority (SBCTA) is San Bernardino's congestion management agency. SBCTA prepares, monitors and periodically updates the County Congestion Management Program (CMP) to meet federal Congestion Management Process requirement and the County's Measure I Program. The San Bernardino County CMP defines a network of state highways and arterials, level of service standards and related procedures; the process for mitigation of impacts of new development on the transportation system and technical justification for the approach.

Measure I Strategic Plan

Measure I authorizes a half-cent sales tax in San Bernardino County until March 2040 for use exclusively on transportation improvement and traffic management programs. Measure I includes language mandating development to pay its fair share for transportation improvements in San Bernardino County. The Measure I Strategic Plan is the official guide for the allocation and administration of the combination of local transportation sales tax, State and federal transportation revenues, and private fair-share contributions to regional transportation facilities to fund the Measure I 2010–2040 transportation programs. The Strategic Plan identifies funding categories and allocations and planned transportation improvement projects in the County for freeways, major and local arterials, bus and rail transit, and traffic management systems. The City has adopted a Development Impact Fee (DIF) program that is consistent with Measure I requirements. The DIF program includes a local traffic development fee which is codified under Rialto Municipal Code 3.33.170.

Rialto General Plan

Chapter 2: Managing Our Land Supply

General Plan Chapter 2, *Managing Our Land Supply* (2010, as amended in 2024), provides guidance to promote the City's goals for current and future development related to Land Use, Community Design, Open Space and Conservation. The following list includes relevant General Plan goals and policies that have been adopted by the City for the purpose of avoiding or mitigating an environmental effect and are applicable to the proposed Project.

Goal 2-23	**Promote commercial and/or industrial development that is well designed, people-oriented, environmentally sustainable, sensitive to the needs of the visitor or resident, and functionally efficient for its purpose.**
Policy 2-23.5	Require developments to provide pedestrian and vehicle connections and pathways between parking lots at the rear and front of buildings.
Policy 2-23.6	Require delivery areas to be separated from pedestrian areas.
Goal 2-36	**Reduce air pollution emissions from both mobile and stationary sources in the City.**
Policy 2-36.2	Require that new development projects incorporate design features that encourage ridesharing, transit use, park and ride facilities, and bicycle and pedestrian circulation.

Chapter 3: Making the Connections – The Circulation Chapter

General Plan Chapter 3: *Making the Connections – The Circulation Chapter* (2010, as amended in 2024) addresses the anticipated level and pattern of development that will generate travel throughout the City

and that must be accommodated by the roadway system, public transportation, and non-motorized forms of transportation. It also notes that Rialto's increasing prominence as a logistics hub will create a demand for goods movement throughout the City that must be accommodated by commercial vehicles and railroads. To help meet these demands and achieve balanced growth, the City has adopted specific goals and policies.

Goal 4-1 **Provide transportation improvements to reduce traffic congestion associated with regional and local trip increases.**

Policy 4-1.17 Require new streets and improvements to connect to established streets.

Policy 4-1.20 Design City streets so that signalized intersections operate at Level of Service (LOS) D or better during the morning and evening peak hours, and require new development to mitigate traffic impacts that degrade LOS below that level. The one exception will be Riverside Avenue south of the Metrolink tracks all the way to the City's southern border, which can operate at LOS E. **Note: LOS is not used under CEQA to evaluate traffic impacts.**

Policy 4-1.21 Design City streets so that unsignalized intersections operate with no vehicular movement having an average delay greater than 120 seconds during the morning and evening peak hours, and require new development to mitigate traffic impacts that increase delay above that level.

Goal 4-2 **Protect residential neighborhoods from through traffic impacts.**

Policy 4-2.1 Locate new development and their access points in such a way that traffic is not encouraged to utilize local residential streets for access to the development and its parking.

Policy 4-2.2 Discourage non-local traffic from using neighborhood streets.

Goal 4-8 **Establish and maintain a comprehensive system of pedestrian trails and bicycle routes that provide viable connections throughout the City.**

Policy 4-8.5 Require major developments to include bicycle storage facilities, including bicycle racks and lockers.

Goal 4-9 **Promote Walking.**

Policy 4-9.1 Install sidewalks where they are missing, and make improvements to existing sidewalks for accessibility purposes. Priority should be given to needed sidewalk improvement near schools and activity centers. Provide wider sidewalks in areas with higher pedestrian volumes.

Policy 4-9.2 Require sidewalks and parkways on all streets in new development projects.

Policy 4-9.4 Accommodate pedestrians and bicyclists – in addition to automobiles – when considering new development projects.

Policy 4-9.6 Encourage new development to provide pedestrian paths through projects, with outlets to adjacent collectors, secondaries, and arterial roadways.

Policy 4-9.7 Require ADA compliance on all new or modified handicap ramps.

Goal 4-10 **Provide a circulation system that supports Rialto's position as a logistics hub.**

Policy 4-10.1 Designate and enforce truck routes for use by commercial trucking as part of the project approval process.

Policy 4-10.3 Develop appropriate noise mitigation along truck routes to minimize noise impacts on nearby sensitive land uses.

Policy 4-10.4 Encourage the development of adequate on-site loading areas to minimize interference of truck loading activities with efficient traffic circulation on adjacent roadways.

Rialto Airport Specific Plan

The Rialto Airport Specific Plan was adopted by the City in November 1997. The Rialto Municipal Airport ceased operations in 2014 and the former airport property and many of the properties adjacent to the Rialto Municipal Airport that were suited to accommodate development were removed from the Rialto Airport Specific Plan and incorporated into the Renaissance Specific Plan, which was adopted by the City in 2010. Although the Rialto Municipal Airport is no longer operational, the Rialto Airport Specific Plan serves as the zoning ordinance for parcels that were not removed; these parcels are primarily northwest, west, and east of the former Rialto Municipal Airport. The Rialto Airport Specific Plan also provides a framework to guide future land use and development decisions in this area. The Rialto Airport Specific Plan included a Circulation Plan consistent with the, then current, City Master Plan of Arterial Highways. The Specific Plan Circulation Plan has been superseded by updates to the Rialto General Plan Circulation Element.

4.15.3 Existing Conditions

Existing Transportation System

Roadways and Roadway Characteristics

Regional access to the project site is provided by State Route 210 (SR-210), located approximately one mile to the south of the project site. In addition, Interstate 15 (I-15 is located approximately four miles to the west, the Interstate 215 (I-215) is approximately four miles to the east, and Interstate 10 (I-10) is approximately six miles to the south.

Locust Avenue. Locust Avenue is located east of and adjacent to the project site, and is designated as a Secondary Arterial. The General Plan identifies that Secondary Arterials have two travel lanes in each direction with left-turn lanes. Locust Avenue is an undivided roadway with two travel lanes in each direction which is oriented in a north-south direction through and beyond the boundaries of the City. Locust Avenue is a truck route between Baseline Road and Riverside Avenue. The posted speed limit on Locust Avenue is 45 miles per hour (mph).

Lowell Street. West of Locust Avenue, Lowell Street is an undivided roadway with one travel lane in each direction. On the north side of the street, there are sidewalks along the first property. The remainder of the north side of Lowell Street has curbs and gutters until its terminus to the west adjacent to the project site. There are no road improvements along the south side of Lowell Street.

Casmalia Street. Casmalia Street is designated as a Secondary Arterial, which provides four travel lanes with a bike lane in each direction and a raised median. Casmalia Street extends in an east-west direction through and beyond the boundaries of the City of Rialto. Casmalia Street is a truck route east of Sierra

Avenue to Ayala Drive, with truck access restricted to local deliveries to the west of Alder Avenue. The posted speed limit on Casmalia Street is 55 miles per hour (mph).

Alder Avenue. Alder Avenue is designated as a Major Arterial. Between Riverside Avenue to the north and Casa Grande Drive to the south, Alder Avenue is an undivided roadway with two travel lanes in each direction and a Class II (4-foot-wide) bike lane adjacent to the curb in each direction with a posted speed limit of 40 mph. Between Casa Grande to the north to its terminus at Summit Avenue, Alder Avenue a raised median. South of the intersection of Alder Avenue at Case Grande Drive, Alder Avenue has two southbound travel lanes and one northbound travel lane with a posted speed limit of 35 mph. There is no public or improved roadway between Summit Avenue and Lake Padden Lane. Alder Avenue extends south from Lake Padden Lane to its southern terminus at I-10; it continues south of I-10 beyond the City of Rialto. Alder Avenue is a truck route between Baseline Road and Casa Grande Drive.

Renaissance Parkway. Renaissance Parkway is located approximately 1.2 miles south of the project site and south of I-210, and is designated as a Major Arterial, with four travel lanes, a bike lane in each direction, and a raised center median. Renaissance Parkway extends in an east-west direction through and beyond the boundaries of the City where it changes its name to Highland Avenue to the west and Easton Street to the east. Renaissance Parkway connects with a number of north-south streets that have interchanges with the SR-210 to the north and I-10 to the south. Renaissance Parkway is a truck route between Alder Avenue and Locust Avenue. Truck access is restricted to local deliveries between Locust Avenue and Ayala Drive, and west of Alder Avenue. The posted speed limit on Renaissance Parkway is 50 mph.

Laurel Avenue. Laurel Avenue is located approximately 0.2-mile west of Locust Avenue and north of the project site and is designated as a Secondary Arterial. In the vicinity of the project site, Laurel Avenue terminates at Bohnert Avenue to the north and extends south across I-210. The undivided roadway has two travel lanes; it does not have a roadway designation in the General Plan. The posted speed limit is 30 mph.

Riverside Avenue. Riverside Avenue is a four- to six-lane generally north-south roadway divided by a painted median through the study area. The posted speed limit is 55 mph and on-street parking is prohibited on both sides of the roadway. Riverside Avenue is designated as a Modified Major Arterial II between Sierra Avenue and Locust Avenue. East of Locust Avenue, Riverside Avenue is designated as a Major Arterial to Foothill Boulevard. Between Foothill Boulevard and the BNSF Railway corridor, it is a Modified Arterial II. South of the rail corridor, Riverside Avenue is a Major Arterial to San Bernardino Avenue; it is a Modified Major Arterial II until Slover Avenue. South of Slover Avenue, it is a Modified Arterial to the southern City boundary. North of I-210, Riverside Avenue has Class II bike lanes. Riverside Avenue is a designated truck route east of Sierra Avenue to Locust Avenue.

Casa Grande Drive – Casa Grande Drive is located approximately 0.5 mile north of the project site with two travel lanes in each direction divided by a painted median and bike lane in each direction. Casa Grande is designated as a Secondary Arterial. Casa Grande Drive is an east-west roadway and extends from Locust Avenue to Sierra Avenue in the City. West of Alder, there is one travel lane in each direction with a Class I bike path. Casa Grande Drive is closed to through traffic at Mango Avenue.

Transit Services

OmniTrans provides public transit service to the San Bernardino Valley, inclusive of the City of Rialto. Bus stops in the project vicinity are on Locust Avenue approximately 250 feet from the intersection of Locust

Avenue at Lowell Street and on Casa Grande Drive approximately 200 feet west of Locust Avenue. There are bus stops further south on Bohnert Avenue at Locust Avenue and further to the north on Riverside Avenue at Locust Avenue. OmniTrans Route 22 operates between the Arrowhead Regional Medical Center in the City of Colton to and through the City of Rialto. Route 22 operates on weekdays between approximately 5:00 AM to 9:40 PM; on Saturdays from approximately 7:15 AM to 7:30 PM; and on Sundays from approximately 7:30 AM to 7:30 PM. Route 22 has a transfer point with Route 312 at the intersection of Renaissance Parkway at Linden Avenue south of I-210.

Bicycle And Pedestrian Facilities

The Circulation Chapter of the General Plan identifies Class I Bikeways (Bike Path; exclusive use for bicycles), Class II Bikeways (Bike Lane; shares the right-of-way with roads or walkways; it has a continuous stripe of the pavement or is separated by a curb or low barrier); and Class II Bikeways (Bike Route; shares the right-of-way; no pavement markings only signage). North of I-210, there are no bikeways on Locust Avenue. The General Plan identifies Class II Bikeways on Casa Grande Drive, Alder Avenue north of Casa Grande Drive, and Riverside Avenue.

With the exception of a portion of sidewalk on the north side of Lowell Street along the property at the northwest corner of Lowell Street at Locust Avenue, there are no sidewalks or pedestrian facilities along Lowell Street. There are sidewalks on portions of Locust Avenue north of Lowell Street. There are no sidewalks or road improvements along the project site fronting Locust Avenue south of Lowell Street.

4.15.4 Methodology

A significant impact would result if the proposed Project resulted in a conflict that could result in a transportation impact. This analysis considers the existing regulatory framework (i.e., laws, ordinances, regulations, and standards) that avoid or reduce the potentially significant environmental impact. Where significant impacts remain despite compliance with the regulatory framework, feasible mitigation measures are recommended, where warranted, to avoid or reduce the Project's potentially significant environmental impacts. The analysis of impacts on transportation examines the Project's temporary (i.e., construction) and permanent (i.e., operational) effects. The impact conclusions consider the potential for changes in environmental conditions, as well as compliance with the regulatory framework enacted to protect the environment.

A project-specific VMT analysis was conducted for the Project. Project-generated VMT is an assessment based on trips and trip distances of project-specific trip purposes. The Project effect on VMT is an estimate of how VMT within the County will change once a project is built and new and existing traffic is redistributed.

Production/Attraction (PA) VMT. Consistent with the City's VMT Guidelines, because the Project does not include residential uses, the Production/Attraction (PA) trip matrix was used to determine project-generated VMT, which separates and isolates employee commute VMT. The calculation of Home-Based-Work VMT per employee (Employee-Based VMT) using the PA method has two components – the total number of weekday trips generated and the average trip length of each vehicle. Home-Based-Work VMT per employee is determined by dividing the total Home-Based-Work attraction VMT by total employment derived from the model. The Home-Based-Work VMT per employee is used to measure the efficiency of VMT generated by work-related uses for the project site traffic analysis zone (TAZ), under Baseline and Cumulative year conditions.

Boundary VMT. The Project's effect on VMT was evaluated using the boundary method. The boundary method is the total daily VMT within a specific area calculated by multiplying the daily vehicle traffic volume on all the roadway segments by the length of each of the roadway segments within that specific study area. This approach includes all trips, including those trips that do not begin or end in the designated boundary. This method also captures the effect of cut-through and/or displaced traffic within the specific study area.

The VMT impact is determined by normalizing the boundary VMT by the service population and comparing the results between the No Project and Plus Project conditions. The Project effect on VMT using the boundary method was evaluated for the countywide boundary.

4.15.5 Thresholds of Significance

The following significance criteria for transportation impacts were derived from the Environmental Checklist in CEQA Guidelines Appendix G. The proposed Project would result in a significant impact related to transportation if it would:

- Conflict with a program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities;
- Conflict or be inconsistent with CEQA Guidelines Section 15064.3(b);
- Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment); or
- Result in inadequate emergency access.

VMT Thresholds

Per the *City of Rialto Traffic Impact Analysis (TIA) Guidelines for Vehicle Miles Traveled (VMT) and Level of Service Assessment (LOS)* (October 2021; VMT Guidelines), VMT impacts are evaluated based on "project-generated VMT" and the "project effect on VMT." The "project-generated VMT" is compared to the baseline Countywide VMT efficient metric, whereas the "project-effect" effect on VMT is compared between the with and without project conditions. The following thresholds of significance apply to the VMT analysis:

- A project's effect on VMT would be considered significant if the baseline link-level boundary (County Boundary) VMT per service population (residents + employees) increases under plus project conditions compared to no project conditions for both baseline and cumulative scenarios.
- A project would result in a significant project-generated VMT impact if the project-generated VMT per service population exceeds the San Bernardino County regional average baseline of 32.7 VMT per service population for both baseline and cumulative scenarios.
- The Cumulative "No Project" scenario shall reflect the adopted RTP/SCS; as such, if a project is consistent with the regional RTP/SCS, then the cumulative impacts shall be considered less than significant subject to consideration of other substantial evidence.

4.15.6 Project Impacts and Mitigation

Threshold 4.15-1:	**Would the Project conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?**
	Level of Significance: Less than Significant Impact

Please refer to **Section 4.7: Greenhouse Gas Emissions** and **Section 4.10: Land Use and Planning**, which includes an evaluation of the Project's consistency with SCAG's Connect SoCal: 2024-2050 RTP/SCS and the City's General Plan, respectively. The project site is within the SCAG region. The Connect SoCal 2024-2050 RTP/SCS forecasts the number of people, households and jobs (at the jurisdictional level) expected throughout SCAG's 191 cities and in unincorporated areas by 2050. This information is typically a component of the City's General Plan, and if available, the City's traffic analysis model.

Growth assumed in the City of Rialto General Plan and its corresponding traffic modeling information and assumptions are supplied to SCAG. The proposed Project is consistent with the General Plan and zoning assumptions. Therefore, because the proposed Project was accounted for in the City's growth forecast, the Project would be consistent with the RTP/SCS. The analysis finds that the Project is consistent with the applicable goal and policies of the 2024-2050 RTP/SCS and the General Plan. The Project's circulation plan would be consistent with the General Plan pertaining to transit, bicycle and pedestrian facilities. The Project would provide pedestrian sidewalks along the project site frontage of Lowell Street and Locust Avenue, which would improve pedestrian circulation in the surrounding area. Public transit routes would continue to operate during Project construction and operations and would not be impacted by Project implementation.

Transit Facilities. OmniTrans bus stops are located on Locust Avenue, Casa Grande Drive, Riverside Avenue, and Bohnert Avenue in the area. The nearest bus stop is just north of the intersection of Locust Avenue at Lowell Street. Project construction and operation would not impact surrounding roadways and thus would not impact transit facilities through closure of roadways that would impede public transit mobility.

Roadways. There is currently no vehicular access to the project site. The Project proposes three new driveways on Lowell Street, one driveway on Locust Avenue, and one emergency vehicle only driveway on Lake Padden Lane. The driveway shown on the site plan on Lake Padden Lane would be provided exclusively for emergency access purposes with no truck or passenger vehicle access. All driveway improvements would be constructed pursuant to the City's requirements. At the Locust Avenue and Lowell Street intersection, the eastbound approach on Lowell Street would be restriped with a dedicated left-turn lane and dedicated right-turn lane; the northbound approach on Locust Avenue would be restriped with a northbound left-turn lane. Improvements to the west side of Locust Avenue along the project site frontage include curb and gutter and pavement replacement extending 14 feet onto the east side of the roadway. Improvements to the south side of Lowell Street include curb and gutter and full width pavement replacement. The Project would not conflict with a plan, ordinance, or policy concerning the existing circulation system or roadway facilities.

Bicycle Facilities. There are currently no bike lanes on Lowell Street or Locust Avenue. On-site bike storage facilities would be provided.

Pedestrian Facilities. There are currently no sidewalks or pedestrian facilities along the project site frontage. Project implementation includes the addition of a pedestrian sidewalk along the project site frontages of Lowell Street and Locust Avenue.

With respect to Threshold 4.15-1, impacts would be less than significant and no mitigation is required.

Threshold 4.15-2:	**Would the Project conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b)?**
	Level of Significance: Less than Significant Impact

The City's VMT Guidelines provide details on appropriate screening thresholds that can be used to identify when a proposed land use project is anticipated to result in a less than significant impact without conducting a more detailed level analysis. According to the City's VMT Guidelines, if a project meets the transit priority area (TPA), low VMT, or project type screening thresholds, the project is presumed to result in a less than significant VMT impact. The proposed Project does not meet the screening thresholds associated with Transit Priority Areas, Low VMT Areas, or Project Type.

The VMT analysis was completed using the current version of San Bernardino County's Travel Demand Model, SBTAM version 3.1 (referred to as the SBTAM Model). The model is trip-based and considers the interactions between different land uses based on socio-economic data, such as population, households, and employment. Adjustments in socio-economic data (population and employment) were made to the appropriate Traffic Analysis Zones (TAZ) in the SBTAM Model to reflect the Project's proposed land uses.

The current version of the SBTAM Model maintains a base year condition of 2019, which was interpolated to 2024 to be representative of baseline conditions. The Cumulative Year for the SBTAM Model is 2050.

The project's VMT analysis was conducted for the following scenarios:

- **Baseline Conditions** – Based on 2019 SBTAM Model version 3.1 conditions and interpolated to 2024 conditions using Cumulative No Project Conditions.
- **Baseline Plus Project Conditions** – Based on the 2019 SBTAM Model with the Project and interpolated to 2024 conditions using Cumulative Plus Project Conditions.
- **Cumulative No Project Conditions** – Based on the updated 2050 SBTAM Model conditions without the Project.
- **Cumulative Plus Project Conditions** – Based on the updated 2050 SBTAM Model conditions with the Project. For this scenario, the TAZ that includes the geographic boundaries of the project site was updated to reflect the Project's land uses. In addition, other TAZs in the City had their future land use growth totals reduced on a weighted basis by employment type to maintain regional control totals. Based on the City guidelines, it is important to maintain appropriate control totals for regional jobs to housing ratio such that the model reflects appropriate future demographic and market conditions. Simply put, the total number of jobs and housing units in the City remained the same as the Cumulative No Project conditions even with the addition of the Project.

Project-generated VMT is an assessment based on trips and trip distances of project-specific trip purposes. The Project effect on VMT is an estimate of how VMT within the County would change once a project is built and new and existing traffic is redistributed.

Table 4.15-1: Baseline Year (2024) Project-Generated VMT identifies the Project's VMT for the Baseline Year (2024) conditions. As shown in the table, the home-based work VMT per employee for the Project is 23.23, which is approximately 22 percent lower than the County average of 29.74.

Table 4.15-1: Baseline Year (2024) Project-Generated VMT

VMT Metric	San Bernardino County	Project
HBW VMT	26,937,842	15,741
Employment	905,832	678
HBW VMT/Employee	29.74	23.23
Exceed Threshold?	**-**	**No**

VMT = vehicle miles traveled; HBW = Home-Based Work
Note: The current version of the SBTAM Model maintains a base year condition of 2019, which was interpolated to 2024 to be representative of existing conditions. The Cumulative Year for the SBTAM Model is 2050.

Table 4.15-2: Cumulative Year (2050) Project-Generated VMT shows the project-generated home-based and home-based work VMT for Cumulative Year (2050) conditions. As shown in the table, the Project's home-based work VMT per employee is 23.42, which is approximately 21 percent lower than the County average of 29.53.

Table 4.15-2: Cumulative Year (2050) Project-Generated VMT

VMT Metric	San Bernardino County	Project
HBW VMT	33,810,918	23,025
Employment	1,144,814	983
HBW VMT/Employee	29.53	23.42
Exceed Threshold?	**-**	**No**

VMT = vehicle miles traveled; HBW = Home-Based Work

Therefore, because the Project's Baseline (2024) and Cumulative Year (2050) Home-Based Work (HBW) VMT per employee are both less than the countywide average, according to the City's VMT Guidelines, the Project would result in a less than significant impact concerning project-generated VMT.

As shown in **Table 4.15-3: Baseline Year (2024) Project Effect on VMT**, the County Boundary VMT per service population decreases under the With Project Condition (22.47) when compared to the Without Project Conditions (22.48).

Table 4.15-3: Baseline Year (2024) Project Effect on VMT

VMT Metric	Without Project	With Project
County Boundary VMT	71,731,963	71,729,970
County Service Population	3,191,574	3,191,780
County Boundary VMT/Service Population	22.48	22.47
Exceed Threshold?	**-**	**No**

VMT = vehicle miles traveled; HBW = Home-Based Work
Note: 2024 VMT results were determined by interpolating model Base Year 2019 and Future Year 2050 results.

Table 4.15-4: Cumulative Year (2050) Project-Generated VMT shows the Cumulative Year (2050) Project effect on VMT for the County. As shown in the table, the County Boundary VMT per service population of 24.59 remains the same under both the With and Without Project Conditions.

Table 4.15-4: Cumulative Year (2050) Project Effect on VMT

VMT Metric	Without Project	With Project
County Boundary VMT	92,487,700	92,482,797
County Service Population	3,761,254	3,761,254
County Boundary VMT/Service Population	24.59	24.59
Exceed Threshold?	**-**	**No**

VMT = vehicle miles traveled; HBW = Home-Based Work

Therefore, because the Project's Baseline Year (2024) and Cumulative Year (2050) Countywide Boundary VMT per service-population does not increase under the With Project conditions, according to the City's VMT Guidelines, the proposed Project would have a less than significant impact based on the VMT impact thresholds and no mitigation is required.

Threshold 4.15-3: **Would the Project substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?**

Level of Significance: Less than Significant Impact

The roadways serving the project site are generally straight and flat. There is currently no vehicular access to the project site. The Project proposes three new driveways on Lowell Street, one driveway on Locust Avenue, and one emergency vehicle only driveway on Lake Padden Lane. The driveway shown on the site plan along Lake Padden Lane would be provided exclusively for emergency access purposes with no truck or passenger vehicle access. All driveway improvements would be constructed pursuant to the City's requirements. At the Locust Avenue and Lowell Street intersection, the eastbound approach on Lowell Street would be restriped with a dedicated left-turn lane and dedicated right-turn lane; the northbound approach on Locust Avenue would be restriped with a northbound left-turn lane. All drive aisles would accommodate standard fire lane turning radiuses and hammerhead turnaround maneuvers for emergency vehicles and fire services. Project operations would not include sharp curves nor would it introduce incompatible uses to area roadways. The two public access roadways adjacent to the project site are Lowell Street and Locust Avenue; Locust Avenue is a truck route. The Project does not include the use of incompatible vehicles on the project site. Further, the project site has a Rialto Airport Specific Plan land use designation of General Manufacturing (I-GM), which permits wholesaling and warehousing uses. The proposed Project is a permitted use under the I-GM land use designation and is considered a compatible use.

The line of sight – a straight line between the driver's eye and oncoming vehicles on the adjacent roadway – defines the "limited use area." The limited-use area for each driveway would be kept clear of visual obstructions, including signage, structures, and obstructive landscaping, in order to maintain adequate sight distance. The Project would be designed in compliance with all applicable State building codes and would meet City standards for design, including sight distance at intersections. Therefore, impacts are considered less than significant and no mitigation is required.

Threshold 4.15-4:	**Would the Project result in inadequate emergency access?**
	Level of Significance: Less than Significant Impact

Internal drive aisles would be up to 40 feet to allow for truck turning movements. In addition, all drive aisles would accommodate standard fire lane turning radiuses and hammerhead turnaround maneuvers to allow access for emergency vehicles. Emergency vehicle access could occur from any of the driveways. All entry gates on the project site would be equipped with Knox Boxes for access by the Rialto Fire Department and Rialto Police Department for emergencies.

Lowell Street is not considered an evacuation route according to the City's Safety Element. Project traffic would not result in substantial delays and congestion that would affect the circulation of emergency vehicles in the study area. While lane closures during construction may be required, construction would not result in the closure of any roadways that would impact the mobility of first responders or increase traffic. SC TRAN-1 requires the preparation of a Construction Management Plan to identify planned travel patterns for haul vehicles. Construction management requirements may include peak hour restrictions, using flag men for short-term obstructions, and a formal traffic control plan should any currently unforeseen extended lane and street closures be required. The Project would be required to incorporate all applicable design and safety requirements as set forth by the City during construction and operation. Therefore, the Project would not result in inadequate emergency access to the City. A less than significant impact would occur and no mitigation is required.

4.15.7 Cumulative Impacts

Circulation System. The proposed Project would connect to the existing circulation system and implement the City's traffic engineering design standards. In addition, the proposed Project would provide new facilities, such as sidewalks, to improve pedestrian mobility; and would not conflict with a plan, ordinance, or policy addressing circulation. In addition, cumulative development in the City and surrounding jurisdictions would be subject to site-specific reviews that would not allow potential cumulatively considerable impacts related to inconsistencies with plans, programs, policies, and ordinances addressing circulation. Therefore, the proposed Project would not combine with other cumulative projects to result in significant cumulative impacts and no mitigation is required.

Vehicle Miles Traveled. For cumulative conditions, a project that is below the VMT impact thresholds and does not have a VMT impact under baseline conditions would also not have a cumulative impact as long as it is aligned with long-term State environmental goals, such as reducing GHG emissions, and relevant plans, such as the SCAG RTP/SCS. The geographic context for the analysis of cumulative traffic impacts includes traffic volumes resulting from buildout of the City of Rialto. In addition, cumulative impacts are based on the future traffic volumes estimated by SCAG, which includes population and socioeconomic projections. The Project is consistent with the General Plan and is accounted for in the growth allocated by the General Plan and analyzed in the General Plan EIR. Based on VMT thresholds of significance, the Project's contribution would not be cumulatively considerable and no mitigation is required.

Design and Incompatible Use Hazards and Emergency Access Adequacy. The evaluation of the proposed Project concluded that it would not result in impacts related to incompatible uses, hazards due to roadway design, or inadequate emergency access. The proposed circulation layout would be required to be installed in conformance with City design standards that would be ensured through the City's development permitting process to provide that no potentially hazardous design features or inadequate

emergency access would be introduced by the Project that could combine with potential hazards from other nearby projects. In addition, cumulative development in the City and surrounding jurisdictions would be subject to site-specific reviews, including reviews by building and fire authorities that would require compliance with existing building and fire code standards that limit the potential of other projects to create design hazards or interference with emergency access. The project site's intended use is compatible with the zoning provided by the Rialto Airport Specific Plan. Therefore, the Project with cumulative projects would not result in a significant cumulative impact related to circulation design features, incompatible uses, and emergency access and no mitigation is required.

4.15.8 Mitigation Program

Standard Conditions

The Project is subject to the City's citywide traffic impact fee program. To the extent that a recommended improvement is included in an existing fee program, a project's payment of impact fees can be used to offset the costs of implementing the measures. In addition, a project may be required to construct a needed improvement in advance of the City's receipt of full funding, in which case the improvement may be subject to a reimbursement agreement, to allow a project to recoup costs from future development.

SC TRAN-1 Prior to issuance of any grading or building permit, the Applicant shall submit for City of Rialto Community Development Director and Traffic Engineer review and approval a Construction Management Plan for the Project. The Plan shall identify construction phasing and address traffic control for any temporary street closures, detours, or other disruptions to traffic circulation and public transit routes. The Plan shall identify the routes that construction vehicles shall use to access the site, the hours of construction traffic, traffic controls and detours, construction materials and vehicle staging areas, and temporary parking arrangements for the construction workers.

Mitigation Measures

No mitigation is required.

4.15.9 Level of Significance After Mitigation

No significant impacts concerning transportation have been identified and no mitigation is required.

Kimley-Horn and Associates, Inc. 2025. *Vehicles Miles Traveled Analysis for Locust Gateway Logistics Center*, included as **Appendix J** of this EIR.

4.16 TRIBAL CULTURAL RESOURCES

4.16.1 Introduction

This section of the EIR provides contextual background information on tribal cultural resources on or near the project site. The extent to which implementation of the proposed Project could impact existing tribal cultural resources is evaluated. This section also provides the results of Assembly Bill 52 (AB 52) tribal consultation.

Tribal cultural resources are defined in Public Resources Code Section 21074 as a site, feature, place, cultural landscape, sacred place or object which is of cultural value to a California Native American tribe and is either [1] on or eligible for the California Historic Register or a local historic register; or [2] the lead agency at its discretion, chooses to treat the resource as a tribal cultural resource.

The analysis in this section was conducted in compliance with Public Resources Code Section 5024.1 and Section 21074 to identify tribal, archaeological and historic resources in the project area and evaluate potential impacts that could result from implementation of the Project. Baseline conditions and impact analyses are based on the Cultural Resources Assessment which is included in **Appendix E** of this EIR. The analysis also includes information obtained during consultations with Native American tribal representatives. Native American tribal resources correspondence is provided in **Appendix K**. Historic and archaeological resources are addressed in **Section 4.4: Cultural Resources**.

4.16.2 Regulatory Setting

State Regulations

Senate Bill 18

Senate Bill (SB) 18 (California Government Code § 65352.3) requires local governments to consult with Native American tribes prior to making certain planning decisions and to provide notice to tribes at certain key points in the planning process. These consultation and notice requirements apply to the adoption and amendment of general plans and specific plans. The consultation process requires (1) that local governments send the State Native American Heritage Commission (NAHC) information on a proposed project and request contact information for local Native American tribes; (2) that local governments then send information on the project to the tribes that the NAHC has identified and notify them of the opportunity to consult; (3) that the tribes have 90 days to respond on whether they want to consult or not, and (4) that consultation begins if requested by a tribe and there is no statutory limit on the duration of the consultation. If issues arise and consensus on mitigation cannot be reached, SB 18 allows a finding to be made that the suggested mitigation is infeasible. SB 18 is not applicable to the Project.

California Assembly Bill 52

On July 1, 2015, California AB 52 of 2014 was enacted and expanded CEQA by defining a new resource category, "tribal cultural resources." AB 52 establishes that "A project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment" (Public Resources Code § 21084.2).

AB 52 also establishes a formal consultation process for California tribes regarding those resources. The consultation process must be completed before an EIR can be released. AB 52 requires that lead agencies "begin consultation with a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project if: (1) the California Native American tribe requested to

the Lead Agency, in writing, to be informed by the Lead Agency through formal notification of proposed projects in the geographic area that is traditionally and culturally affiliated with the tribe, and (2) the California Native American tribe responds, in writing, within 30 days of receipt of the formal notification, and requests the consultation." Native American tribes to be included in the process are those that have requested notice of projects proposed within the jurisdiction of the Lead Agency. Consultation may include discussing the type of environmental review necessary, the significance of tribal cultural resources, the significance of a project's impacts on the tribal cultural resources, and alternatives and mitigation measures recommended by the tribe.

The parties must consult in good faith, and consultation is deemed concluded when either the parties agree on measures to mitigate or avoid a significant effect on a tribal cultural resource (if such a significant effect exists) or when a party concludes that mutual agreement cannot be reached.

Health and Safety Code Sections 7050.5 and 7052

State Health and Safety Code (HSC) Section 7050.5, declares that, in the event of the discovery of human remains outside of a dedicated cemetery, all ground disturbance must cease, and the San Bernardino County Coroner must be notified. HSC Section 7052 establishes a felony penalty for mutilating, disintering, or otherwise disturbing human remains, except by relatives.

More precisely, if human remains are encountered, Section 7050.5 states that:

a) Every person who knowingly mutilates or disinters, wantonly disturbs, or willfully removes any human remains in or from any location other than a dedicated cemetery without authority of law is guilty of a misdemeanor, except as provided in Section 5097.99 of the Public Resources Code. The provisions of this subdivision shall not apply to any person carrying out an agreement developed pursuant to subdivision (l) of Section 5097.94 of the Public Resources Code or to any person authorized to implement Section 5097.98 of the Public Resources Code.

b) In the event of discovery or recognition of any human remains in any location other than a dedicated cemetery, there shall be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent remains until the Coroner of the county in which the human remains are discovered has determined, in accordance with Chapter 10 (commencing with Section 27460) of Part 3 of Division 2 of Title 3 of the Government Code, that the remains are not subject to the provisions of Section 27491 of the Government Code or any other related provisions of law concerning investigation of the circumstances, manner and cause of any death, and the recommendations concerning the treatment and disposition of the human remains have been made to the person responsible for the excavation, or to his or her authorized representative, in the manner provided in Section 5097.98 of the Public Resources Code. The Coroner shall make his or her determination within two working days from the time the person responsible for the excavation, or his or her authorized representative, notifies the Coroner of the discovery or recognition of the human remains.

c) If the Coroner determines that the remains are not subject to his or her authority and if the Coroner recognizes the human remains to be those of a Native American, or has reason to believe that they are those of a Native American, he or she shall contact, by telephone within 24 hours, the Native American Heritage Commission."

Regional and Local Regulations

Rialto General Plan

General Plan Chapter 7, *Our Roots: Cultural and Historic Resources Element,* recognizes that the "future of Rialto is linked strongly to its past." The following list includes General Plan goals and policies that have been adopted by the City for the purpose of avoiding or mitigating an environmental effect and are applicable to the proposed Project.

Goal 7-1 **Preserve Rialto's significant historical resources as a source of community identity, stability, aesthetic character, and social value.**

Policy 7-1.1 Protect the architectural, historical, agricultural, open space, environmental, and archaeological resources in Rialto.

Goal 7-3 **Identify, document, and protect significant archaeological resources in Rialto.**

Policy 7-3.1 Require archaeological surveys during the development review process for all projects in archaeologically sensitive areas where no previous surveys are recorded.

Policy 7-3.3 Avoid impacts to potentially significant prehistoric and historical archaeological resources and sites containing Native American human remains consistent with State law.

Policy 7-3.4 Reduce adverse impacts to significant archaeological resources that cannot be protected in place through data recovery excavations.

Rialto Airport Specific Plan

The Rialto Airport Specific Plan was adopted by the City in November 1997. The Rialto Municipal Airport ceased operations in 2014 and the former airport property and many of the properties adjacent to the Rialto Municipal Airport that were suited to accommodate development were removed from the Rialto Airport Specific Plan and incorporated into the Renaissance Specific Plan, which was adopted by the City in 2010. Although the Rialto Municipal Airport is no longer operational, the Rialto Airport Specific Plan serves as the zoning ordinance for parcels that were not removed; these parcels are primarily northwest, west, and east of the former Rialto Municipal Airport. The Rialto Airport Specific Plan also provides a framework to guide future land use and development decisions in this area. The Rialto Airport Specific Plan does not contain specific policies related to tribal cultural resources.

City of Rialto Municipal Code

Municipal Code Chapter 2.20[1] establishes the Historical Preservation Commission. The commission is authorized to make recommendations, decisions and determinations concerning the designation, preservation, protection, enhancement, and perpetuation of these historical and cultural resources which contribute to the culture and aesthetic values of the City. Government Code Section 37361 empowers cities to adopt regulations and incentives for the protection, enhancement, perpetuation and use of such places, buildings, structures and other objects. The adoption of reasonable and fair regulations is necessary as a means of recognition, documentation, preservation and maintenance of resources of cultural, aesthetic, or historical significance. Such regulation serves to integrate the preservation of resources and the extraction of relevant data from such resources into public and private land management and development processes, and to identify as early as possible and resolve conflicts

[1] City of Rialto Municipal Code. Retrieved from: https://library.municode.com/ca/rialto/codes/code_of_ordinances.Accessed July 2024.

between the preservation of cultural resources and alternative land uses. Chapter 2.20 is intended to carry out the goals and policies of the General Plan.

4.16.3 Existing Conditions

Natural Setting

The project site is situated to the southwest of the Cajon Pass, 2.5 miles southeast of the San Bernardino National Forest in the northwestern portion of the City of Rialto. On-site elevations range from approximately 1,612 to 1,649 feet above mean sea level and generally slope from northwest to southeast at an approximately 2 to 9 percent grade. The City is largely urbanized and bordered by other developed areas; the setting surrounding the project site is primarily light and heavy industrial. Residential land uses are located east of Locust Avenue. Previous on-site land uses include a historic ammunition complex, and stockpiling and storage activities. The project site has been heavily disturbed and currently vacant and contains vegetation noted as a mix of chaparral and non-native grasslands.

Prehistoric Setting

Maara'yam/Serrano

The project site is within the ancestral territory of the Maara'yam, often referred to as "Serrano", which was the term adopted by the Spanish and later communities. The Maara'yam occupied a territory of over 7.4 million acres, which was sparsely populated and used in a seasonal manner with clans occupying valley floors in cool seasons and higher elevations in the warm seasons. Evidence of long-term settlement in the immediate area is indicated by the presence of villages to the north and northeast in the mountains and Cajon Pass, as well as west toward Rancho Cucamonga. The Maara'yam also interacted with other cultural groups, such as the Cahuilla, Luiseno, Mojave, and Gabrieleño for the purpose of trade and cultural practice. Across the region, Maara'yam were organized into clans affiliated with one of two exogamous moieties, Coyote or Wildcat.

Villages were typically clan-based and the Maara'yam typically engaged in specific practices between clans/villages, such as marriage outside their clan. Subsistence strategies focused on hunting and gathering which were supplemented by fishing. Food preparation varied, ranging from baking in earth ovens to parching. Food processing tools included scrapers, bowls, baskets, mortars, and metates. Dwellings were usually circular domes that used willow and reeds. They also used ramadas, which consisted of a thatched roof supported by vertical poles in the ground that provided shade. Other structures in villages were used for community and ceremonial reason. A lineage leader, or *kika'*, administered laws and ceremonies from a large ceremonial house centrally located in most villages.

Gabrieleño/Tongva

The project site is also within the ancestral territory of the Gabrieleño/Tongva. It is generally understood that their ancestral territory included the watersheds of the San Gabriel, Santa Ana, and Los Angeles Rivers, portions of the Santa Monica and Santa Ana Mountains, the Los Angeles Basin, the coast from Aliso Creek to Topanga Creek, and San Clemente, San Nicolas, and Santa Catalina Islands. The Gabrieleño/Tongva have a rich and diverse material culture, traditionally including shell set in asphaltum, carvings, painting, baskets, an extensive steatite industry, and a wide range of stone, shell, and bone materials. At the time of European colonization, they inhabited numerous permanent villages in fertile lowlands along waterways in sheltered areas along the coast, each of which held a population in the low hundreds. Smaller villages were also located at varying distances from these permanent villages, all of

which were highly connected via economic, religious, and social ties. Villages contained circular and domed homes made of tule mats, fern, or carrizo, as well as small, circular earth-covered sweathouses. Their hunting and gathering subsistence strategy included land and offshore efforts that resulted in the intake of both small and large land animals, sea mammals, river and ocean fish, and a variety of plant resources. The population sometimes migrated between villages on a temporary basis throughout the year, returning to their permanent villages for ceremonies or when resources needed to be replenished.

Records show that the long history of European colonization and displacement of Native Americans initially began in 1542 as a result of Juan Rodríguez Cabrillo visiting the Los Angeles area during exploration. The Missions San Gabriel and San Fernando were established in 1771 and 1797, respectively. According to mission records, many Gabrieleño/Tongva were forced into the system because of the location of the missions within their ancestral lands. The Serrano faced similar displacement with many of the clans in the adjacent San Bernardino Valley, mountains, and Antelope Valley being removed to the San Gabriel Mission or forced to support Mission lands doing agricultural labor. Due in part to the introduction of new diseases, as well as the harsh conditions of mission life, the indigenous population quickly declined and cultural practices were lost.

Following the secularization of the missions, most surviving Gabrieleño/Tongva and Serrano became wage laborers on the ranchos of Mexican California and were later nearly completely wiped out as a result of a smallpox outbreak in the 1860s. The combination of removal, murder, disease, forced labor, and poor diet contributed to the dispersion of the Gabrieleño/Tongva and Serrano from established villages to scattered areas for survival. During the 1800s, groups of remaining Serrano in San Bernardino County were removed to the San Manuel Reservation and Morongo Reservation, where they were granted federal recognition as domestic dependent sovereign nations. The displacement of the Gabrieleño/Tongva, whose lands ancestral lands were coveted by government and private landowners, has led to difficulty in attaining federal recognition. However, during the 20th century, there was a revitalization of the Serrano and Gabrieleño/Tongva people and cultures, and these communities remain active within their ancestral territories in the modern day.

Historic Setting

Please refer to **Section 4.4: Cultural Resources**, of this EIR.

4.16.4 Methodology

NAHC Sacred Lands File Search

A Sacred Lands File (SLF) search was requested from NAHC on February 20, 2024, to determine if there was any information relating to the potential presence of Native American cultural resources on the project site. A response was received on February 26, 2024, indicating that the SLF check was positive and noted that the Gabrieleño Band of Mission Indians – Kizh Nation should be contacted for additional information. A list of tribal contacts who may have also had an interest in the project site was provided with the NAHC response (refer to **Appendix K**).

AB 52 Tribal Consultation

In compliance with Public Resources Code Section 21080.3.1(b), the City of Rialto sent formal notification on March 12, 2024, to tribal representatives which may have interest in projects within the geographic area traditionally and culturally affiliated with the tribe(s) and have requested notifications of applicable

development projects from the City. Formal notification letters were sent to representatives of the following California Native American tribes based on the list of tribal contacts provided by the NAHC:

- Yuhaaviatam of San Manuel Nation (formerly known as San Manuel Band of Mission Indians)
- Morongo Band of Mission Indians
- Gabrieleño-Tongva San Gabriel Band of Mission Indians
- Gabrieleño/Tongva Nation
- Agua Caliente Band of Cahuilla Indians
- Gabrieleño Band of Mission Indians – Kizh Nation
- Gabrieleño Tongva Indians of California Tribal Council
- Gabrieleño-Tongva Tribe
- Quechan Tribe of the Fort Yuma Reservation
- Soboba Band of Luiseno Indians

The Yuhaaviatam of San Manuel Nation and the Kizh Nation responded on March 18, 2024 and March 21, 2024, respectively, requesting consultation to discuss the Project in further detail. The Yuhaaviatam of San Manuel Nation requested receipt of the Cultural Resources Report (**Appendix E** of this EIR), the Geotechnical Investigation Report (**Appendix F1**), and the Project plans and anticipated depth of disturbance. Upon review of the information provided by the City, the Yuhaaviatam of Manuel Nation contacted the City on August 15, 2024, noting that they did not have concerns regarding the Project and provided mitigation language for incorporation into the Cultural Resources and Tribal Cultural Resources sections of the EIR. The City responded to the Kizh Nation's request for consultation, and as a result provided their requested mitigation language to the City on August 22, 2024. The Morongo Band of Mission Indians provided comments to the City on December 12, 2024, including recommended mitigation measures.

4.16.5 Thresholds of Significance

The following significance criteria for tribal cultural resources were derived from the Environmental Checklist in State CEQA Guidelines Appendix G. An impact would be considered significant and would require mitigation if it would:

- Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

  a) Listed or eligible for listing in the California Register of Historical Resources (CRHR), or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k), or

  b) A resource determined by the Lead Agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resources Code Section 5024.1, the Lead Agency shall consider the significance of the resource to a California Native American tribe.

4.16.6 Project Impacts and Mitigation

This analysis of impacts on cultural resources examines the Project's construction and operational effects based on application of the significance criteria outlined above. The impact conclusions consider the potential for changes in environmental conditions, as well as compliance with the regulatory framework enacted to protect the environment.

Threshold 4.16-1:	**Would the Project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:** **(a) Listed or eligible for listing in the CRHR, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k)?** **(b) A resource determined by the Lead Agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resources Code Section 5024.1, the Lead Agency shall consider the significance of the resource to a California Native American tribe.** ***Level of Significance:*** Less than Significant with incorporation of MM CUL-2, MM CUL-3, MM CUL-5, and MM TCR-1 through MM TCR-3.

Chapter 532 Statutes of 2014 (i.e., AB 52) requires that lead agencies evaluate a project's potential impact on "tribal cultural resources." Such resources include "sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that are eligible for inclusion in the California Register of Historical Resources or included in a local register of historical resources." AB 52 also gives lead agencies the discretion to determine, based on substantial evidence, whether a resource qualifies as a "tribal cultural resource."

In compliance with Public Resources Code Section 21080.3.1(b), the City provided formal notification to California Native American tribal representatives identified by the California Native American Heritage Commission. Native American groups may have knowledge about cultural resources in the area and may have concerns about the adverse effects of development on tribal cultural resources as defined in Public Resources Code Section 21074. The City contacted the tribal representatives as noted above.

It is unlikely that tribal cultural resources are present on the project site, given the pedestrian survey results, record search results, Native American tribal consultations, review of archival and environmental data, and existing site disturbance. While low, there is the potential for tribal cultural resources to be inadvertently unearthed during excavation and grading activities. Therefore, Project construction activities could result in potential impacts to previously unidentified tribal cultural resources or human remains. The Project would be subject to compliance with MM CUL-2, MM CUL-3, and MM CUL-5, which requires the preparation of a Cultural Resources Management plan to be approved by the consulting tribes, a cultural resource sensitivity training, and in the event a cultural resources is discovered, work shall cease within a 60 foot buffer and if the resources is Native American in origin, the consulting tribes shall be contacted regarding potential significance and treatment of the resource outlined in MM TCR-3. The Project would also be subject to compliance with MM TCR-1 which requires the retention on a Native

American Monitor from or approved by the Gabrieleño Band of Mission Indians – Kizh Nation, MM TCR-2 which requires a Tribal Monitoring Services Agreement with the Morongo Band of Mission Indians, and MM TCR-3 which outlines protocol in the event of discovery of a tribal cultural resource, including compliance with the Cultural Resource Management plan outlined in MM CUL-2 and coordination with the Consulting Tribes. Additionally, the Project would comply with California State Health and Safety Code Section 7050.5 and Public Resources Code Section 5097.98, as outlined in SC CUL-1, which outlines procedures and treatment in the event human remains are discovered during excavation and disturbance activities. Therefore, compliance with the established regulatory framework and the mitigation measures outlined above would reduce potential impacts to tribal cultural resources to a less than significant level.

4.16.7 Cumulative Impacts

For purposes of cumulative impact analysis to cultural and tribal resources, the geographic context for cumulative analysis is regional and considers both direct and indirect impacts over a wide area. However, the discussion is focused on a project's potential for resulting in site-specific impact that could contribute to a cumulative loss. Accordingly, impacts are site-specific and not generally subject to cumulative impacts unless multiple projects impact a common resource, or an affected resource extends off the site. With this consideration, the cumulative analyses for tribal cultural resources considers whether the Project, in combination with the past, present, and reasonably foreseeable projects, could cumulatively affect any common resource.

As discussed above, the project site does not contain any known tribal cultural resources. However, the potential exists for undiscovered tribal cultural resources to be adversely impacted during groundbreaking activities. In the event that a potential tribal cultural resource is found, the Project would implement measures to mitigate further damage to the found tribal resource. Therefore, Project impacts would be reduced to a less than significant level.

In addition, future cumulative development projects have the potential to encounter/adversely affect tribal cultural resources. Potential tribal cultural resource impacts associated with other project development would be site-specific and would undergo environmental and development plan review in order to evaluate potential impacts. The combination of the proposed Project as well as past, present, and reasonably foreseeable projects would be required to comply with all applicable State, federal, and local regulations concerning preservation, salvage, or handling of cultural and tribal cultural resources, including compliance with required mitigation. This also includes project-by-project consultation with the appropriate tribal representatives to discuss mitigation measures that would be included to mitigate impacts to tribal cultural resources. Therefore, the Project's contribution to cumulative impacts would be less than cumulatively considerable.

4.16.8 Mitigation Program

Standard Conditions

Please refer to Standard Condition (SC) CUL-1 in **Section 4.4: Cultural Resources**.

Mitigation Measures

MM CUL-2, MM CUL-3, and MM CUL-5 are applicable, please refer to Section 4.4: Cultural Resources.

MM TCR-1 **Native American Monitoring for Gabrieleño Band of Mission Indians – Kizh Nation.** The Project Applicant shall retain a Native American Monitor from or approved by the

Gabrieleño Band of Mission Indians – Kizh Nation. The monitor shall be retained prior to the commencement of the first permit that would result in a "ground-disturbing activity" for the subject project at all project locations (i.e., both on-site and any off-site locations that are included in the project description/definition and/or required in connection with the project, such as public improvement work). "Ground-disturbing activity" shall include, but is not limited to, demolition, pavement removal, potholing, auguring, grubbing, tree removal, boring, grading, excavation, drilling, and trenching.

A copy of the executed monitoring agreement shall be submitted to the City of Rialto prior to the commencement of any ground-disturbing activity, or the issuance of any permit necessary to commence a ground-disturbing activity. The agreement would also address the consideration of rotating monitoring with the Morongo Band of Mission Indians.

The monitor shall complete monitoring logs that provide descriptions of the relevant ground-disturbing activities, the type of construction activities performed, locations of ground-disturbing activities, soil types, cultural-related materials, and any other facts, conditions, materials, or discoveries of significance to the Tribe. Monitor logs shall identify and describe any discovered TCRs, including but not limited to, Native American cultural and historical artifacts, remains, places of significance, etc., (collectively, tribal cultural resources, or "TCR"), as well as any discovered Native American (ancestral) human remains and burial goods. Copies of monitor logs shall be provided to the Project Applicant/City of Rialto upon written request to the Tribe.

On-site tribal monitoring shall conclude upon one of the following (1) written confirmation to the Kizh from a designated point of contact for the Project Applicant or City of Rialto that all ground-disturbing activities and phases that may involve ground-disturbing activities on the project site or in connection with the Project are complete; or (2) a determination and written notification by the Kizh to the Project Applicant or City of Rialto that no future, planned construction activity and/or development/construction phase at the project site possesses the potential to impact Kizh TCRs.

MM TCR-2: **Native American Monitoring for Morongo Band of Mission Indians.** Prior to the issuance of the first permit that would result in a "ground-disturbing activity," the Applicant shall enter into a Tribal Monitoring Services Agreement with the Morongo Band of Mission Indians for the Project. The agreement would also address the consideration of rotating monitoring with the Gabrieleño Band of Mission Indians – Kizh Nation. The Tribal Monitor shall be on-site during all (or as deemed necessary) ground-disturbing activities (including, but not limited to, clearing, grubbing, tree and bush removal, grading, trenching, fence post placement and removal, construction excavation, excavation for all utility and irrigation lines, and landscaping phases of any kind). The Tribal Monitor shall have the authority to temporarily divert, redirect, or halt the ground-disturbing activities to allow identification, evaluation, and potential recovery of cultural resources. The Tribal Monitor can establish a buffer around the discovery.

MM TCR-3: **Inadvertent Discovery of a Tribal Cultural Resource.** The Consulting Tribes shall be contacted and informed of any pre-contact cultural resources discovered during Project implementation, and be provided information regarding the nature of the find, so as to provide Tribal input with regards to significance and treatment (pursuant to Mitigation

Measure [MM] CUL-5). Should the find be deemed significant, as defined by CEQA, the find shall be addressed to the protocols outlined in the Cultural Resources Management Plan from MM CUL-2. Any and all archaeological/cultural documents created as a part of the Project (isolate records, site records, survey reports, testing reports, etc.) shall be supplied to the Project Applicant and the City of Rialto for dissemination to the Consulting Tribes.

4.16.9 Level of Significance After Mitigation

With implementation of the Mitigation Program set forth in this EIR, potential impacts to tribal cultural resources would be reduced to a level considered less than significant.

4.16.10 References

Kimley-Horn and Associates, Inc. May 2024. *Cultural Resources Assessment for the Locust Gateway Logistics Project*. Included as **Appendix E** to this EIR.

4.17 UTILITIES AND SERVICE SYSTEMS

4.17.1 Introduction

This section of the EIR examines the utilities and service systems that would be used by the proposed Project and describes the potential impacts on those systems due to the implementation of the Project. Specifically, this section addresses water supply, wastewater, dry utilities, and solid waste. A Water Supply Assessment (WSA) was prepared by Water Systems Consulting, Inc. (January 2025) on behalf of the West Valley Water District (WVWD). The WSA is summarized in this section and is provided as **Appendix L** to this EIR. Storm drain facilities are addressed in **Section 4.8: Hydrology and Water Quality**.

4.17.2 Regulatory Setting

Federal Regulations

Please refer to **Section 4.5: Energy** regarding federal and State energy regulations.

Clean Water Act

The Clean Water Act (33 United States Code §§ 1251 et seq.) is the primary federal law that protects the nation's waters, including lakes, rivers, aquifers, and coastal areas. The statute employs a variety of regulatory and non-regulatory tools to sharply reduce direct pollutants discharges into waterways, finance municipal wastewater treatment facilities, and manage polluted runoff. These tools are employed to achieve the broader goal of restoring and maintaining the chemical, physical, and biological integrity of the nation's waters so that they can support "the protection and propagation of fish, shellfish, and wildlife and recreation in and on the water."

Section 401 of the Clean Water Act requires that any applicant for a federal permit to conduct any activity, including the construction or operation of a facility that may result in the discharge of any pollutant, obtain State certification. Section 303 of the Clean Water Act requires states to identify surface waters that have been impaired. Under Section 303(d), states, territories, and authorized tribes are required to develop a list of water quality segments that do not meet water quality standards, even after point sources of pollution have installed the minimum required levels of pollution control technology.

Safe Drinking Water Act

The Safe Drinking Water Act (Health and Safety Code §§ 116350–116405) is intended to protect public health by regulating the nation's public drinking water supply. The federal Safe Water Drinking Act authorizes the U.S. Environmental Protection Agency (U.S. EPA) to set national standards for drinking water to protect against both naturally occurring and man-made contaminants.

State Regulations

State Water Resources Control Board

The State Water Resources Control Board (SWRCB) is the California agency focused on providing and ensuring clean sustainable water for all California residents. The SWRCB works alongside federal programs like the Clean Water Act to regulate water sources and uses. The agency regulates water consumption for irrigation and drinking, as well as water discharges from construction, municipal uses, storm water, and other sources.

The SWRCB preserves, enhances, and restores the quality of California's water resources and ensures proper allocation and efficient use for the benefit of present and future generations. Wastewater

generators must obtain a permit to discharge their wastewater. Pursuant to the federal Clean Water Act and California's Porter-Cologne Water Quality Control Act, the SWRCB regulates wastewater discharges to surface waters through the National Pollution Discharge Elimination System (NPDES) program. Some wastewater discharges are exempt from federal NPDES requirements, but California law may still apply. Under California law, the SWRCB requires waste discharge requirements for some discharges, in addition to those subject to NPDES permits. Permits contain specific requirements that limit the pollutants in discharges. They also require dischargers to monitor their wastewater to ensure that it meets all requirements. Wastewater dischargers must maintain their treatment facilities, and treatment plant operators must be certified. The SWRCB routinely inspects treatment facilities and strictly enforces permit requirements.

California Safe Drinking Water Act

California enacted its own Safe Drinking Water Act, with the California Department of Health Services (DHS) granted primary enforcement responsibility. Title 22 of the California Code of Regulations (CCR) (Division 4, Chapter 15, "Domestic Water Quality and Monitoring Regulations") established DHS authority and provides drinking water quality and monitoring requirements, which are equal to or more stringent than federal standards.

Urban Water Management Plan Act

In 1983, the Urban Water Management Planning Act (UWMP Act) was established by Assembly Bill (AB) 797, and passage of this law recognized that water is a limited resource and that efficient water use and conservation would be actively pursued throughout the State of California. The UWMP Act requires that water suppliers providing water for municipal purposes either directly or indirectly to more than 3,000 customers, or supplying more than 3,000 acre-feet of water annually, prepare and submit an Urban Water Management Plan (UWMP) to the California Department of Water Resources (DWR) every five years.

Senate Bill 610 and Senate Bill 221

Senate Bill (SB) 610 (Public Resources Code § 21151.9 and Water Code § 10910 et seq.) requires the preparation of "water supply assessments" for large developments.[1] These are defined as:

- A proposed residential development of more than 500 dwelling units
- A proposed shopping center or business establishment employing more than 1,000 persons or having more than 500,000 square feet (sf) of floor space.
- A proposed commercial office building employing more than 1,000 persons or having more than 250,000 sf of floor space.
- A proposed hotel or motel, or both, having more than 500 rooms.
- A proposed industrial, manufacturing, or processing plant, or industrial park planned to house more than 1,000 persons, occupying more than 40 acres of land, or having more than 650,000 sf of floor area.
- A mixed-use project that includes one or more of the projects specified above.

[1] California Department of Water Resources (DWR). 2003. *Guidebook for Implementation of Senate Bill 1610 and Senate Bill 221 of 2001.* Page iii. Accessed August 12, 2024.

- A project that would demand an amount of water equivalent to, or greater than, the amount of water required by a 500 dwelling unit project.

These water supply assessments, prepared by public water systems responsible for service, address whether adequate existing or projected water supplies are available to serve proposed projects, in addition to urban and agricultural demands and other anticipated development in the service area in which the project is located.

A water supply assessment is included in any environmental document prepared for a project. Where a water supply assessment concludes that insufficient supplies are available, it must describe steps that would be required to obtain the necessary supply. The content requirements for the assessment include identification of the existing and future water suppliers and quantification of water demand and supply by source in five-year increments over a 20-year projection. This information must be provided for average normal, single-dry, and multiple-dry years. The absence of an adequate current water supply does not preclude project approval but does require a lead agency to address a water supply shortfall in its project approval findings.

Additionally, SB 610 requires new information to be included as part of an UWMP if groundwater is identified as a source of water available to the supplier. Information must include a description of all water supply projects and programs that may be undertaken to meet total projected water use. SB 610 prohibits eligibility for funds from specified bond acts until the plan is submitted to the State. SB 221 requires written verification that there is sufficient water supply available for applicable new residential subdivisions. The verification must be provided before commencement of construction.

California Recycled Water Regulations

The regulation of recycled water is vested by State law in the SWRCB and the California Department of Public Health Services (DPH). DPH is responsible for the regulations concerning the use of recycled water. Title 17 (California Water Code, §§ 13500–13556) regulates the protection of the potable water supply through the control of cross-connections with potential contaminants, including recycled water. The established water quality standards and treatment reliability criteria for recycled water are codified in Title 22 of the California Water Code. The requirements of Title 22, as revised in 1978, 1990 and 2001, establish the quality and/or treatment processes required for a recycled effluent to be used for a non-potable application. In addition to recycled water uses and treatment requirements, Title 22 addresses sampling and analysis requirements at the treatment plant, preparation of an engineering report prior to production or use of recycled water, general treatment design requirements, reliability requirements, and alternative methods of treatment.

Assembly Bill 1668 and Senate Bill 606

Assembly Bill (AB) 1668 and SB 606 establish guidelines for efficient water use and a framework for implementation and oversight of the new standards, which were required to be in place by 2022. The two bills strengthen the State's water resiliency in the face of future droughts with provisions that include:

- Establishing water use objectives and long-term standards for efficient water use that apply to urban retail water suppliers; and indoor residential water use, outdoor residential water use, commercial, industrial and institutional irrigation with dedicated meters, water loss, and other unique local uses.
- Providing incentives for water suppliers to recycle water.

- Identifying small water suppliers and rural communities that may be at risk of drought and water shortage vulnerability and provide recommendations for drought planning. Requiring both urban and agricultural water suppliers to set annual water budgets and prepare for drought.
- Requiring both urban and agricultural water suppliers to set annual water budgets and prepare for drought.[2]

California Code, Government Code Section 66013

Pursuant to the Government Code, water and sewer connections for new development to existing infrastructure may be associated with fees from the corresponding local agency. These fees or charges shall not exceed the estimated reasonable cost of providing the service for which the fee is charged or imposed unless taken to a vote regarding if the amount imposed is in excess of the estimated reasonable cost of providing the service.

Sanitary Sewer Management Plan

The SWRCB adopted Wastewater Discharge Requirements Order 2006-0003-Division of Water Quality (DWQ) on May 2, 2006. This order mandates all federal and State agencies, municipalities, counties, districts, and other public entities ("enrollees") that own or operate sanitary sewer systems greater than one mile in length that collect and/or convey untreated or partially treated sewer to a publicly owned treatment works facility in California to comply with the terms of the order. Order 2006-0003-DWQ also requires each enrollee to develop and implement a system-specific sewer management plan to facilitate proper funding and management of sanitary sewer systems. Sewer system management plans must include provisions to provide proper and efficient management, operation, and maintenance of sanitary sewer systems, while taking into consideration risk management and cost/benefit analysis. Additionally, a sewer system management plan must contain a spill response plan that establishes standard procedures for immediate response to a sewer system overflow in a manner designed to minimize water quality impacts and potential nuisance conditions.

Wastewater Discharge Requirements Order 2006-0003-DWQ

On May 2, 2006, the SWRCB adopted Wastewater Discharge Requirements Order 2006-0003-DWQ. This order mandated all federal and State agencies, municipalities, counties, districts, and other public entities ("enrollees") that own or operate sanitary sewer systems greater than one mile in length that collect and/or convey untreated or partially treated sewage to a publicly owned treatment works facility in California to comply with the terms of the order. Order 2006-0003-DWQ also stated that, to facilitate proper funding and management of sanitary sewer systems, each enrollee must develop and implement a system-specific sewer management plan. To be effective, sewer system management plans must include provisions to provide proper and efficient management, operation, and maintenance of sanitary sewer systems, while taking into consideration risk management and cost/benefit analysis. Additionally, a sewer system management plan must contain a spill response plan that establishes standard procedures for immediate response to a sewer system overflow in a manner designed to minimize water quality impacts and potential nuisance conditions.

[2] State of California. *California Statutes Making Conservation a California Way of Life*. Retrieved from: https://www.waterboards.ca.gov/water_issues/programs/conservation_portal/california_statutes.html. Accessed August 12, 2024.

Sewer System Management Plan

The SWRCB requires wastewater collection providers to report sanitary sewer overflows and to prepare and implement Sewer System Management Plans (SSMP). The SSMP policy requires dischargers to provide adequate capacity in the sewer collection system, take feasible steps to stop sewer overflows, identify and prioritize system deficiencies, and develop a plan for disposal of grease, among other requirements. In addition, wastewater providers must report sanitary sewer overflows to the Santa Ana Regional Water Quality Control Board (RWQCB), keep internal records of these overflows, and produce an annual report on overflows. Newport Beach's Utilities Department prepared a SSMP in September 2019, in compliance with the SWRCB.

Assembly Bill 341

AB 341, approved in October 2011, is intended to reduce greenhouse gas emissions by diverting commercial solid waste to recycling efforts and to expand the opportunity for additional recycling services and recycling manufacturing facilities in the state. It is the policy goal of the State that not less than 75 percent of solid waste generated be source reduced, recycled, or composted by 2020. This law requires California commercial businesses and public entities that generate four or more cubic yards of commercial solid waste per week, or a multi-family residential dwelling with five or more units, to arrange for recycling services.

Each local jurisdiction is required to inform businesses about the recycling requirement and to keep track of the level of recycling within the business community. In addition, each jurisdiction is required to report to California's Department of Resources Recycling and Recovery (CalRecycle), the State agency that oversees recycling and solid waste, on progress in the business community.[3]

Assembly Bill 939

Assembly Bill 939, the California Integrated Waste Management Act of 1989, requires each city or county to prepare a Source Reduction and Recycling Element (SRRE) to its Solid Waste Management Plan, that identifies how each jurisdiction will meet the mandatory state waste diversion goal of 50 percent by and after the year 2000. Subsequent legislation changed the reporting requirements and threshold, but restated source reduction as a priority.

California Solid Waste Reuse and Recycling Access Act of 1991

The California Solid Waste Reuse and Recycling Access Act requires areas in development projects to be set aside for collecting and loading recyclable materials. The Act required CalRecycle (formerly the California Integrated Waste Management Board) to develop a model ordinance for adoption by any local agency relating to adequate areas for collection and loading of recyclable materials as part of development projects. Local agencies are required to adopt the model, or an ordinance of their own, to provide adequate areas in development projects for the collection and loading of recyclable materials.

Solid Waste Disposal Measurement Act of 2008

The purpose of the Solid Waste Disposal Measurement Act of 2008 (SB 1016) is to make the process of goal measurement (as established by AB 939) simpler, timelier, and more accurate. SB 1016 builds on AB 939 compliance requirements by implementing a simplified measure of jurisdictions' performance. SB 1016 accomplishes this by changing to a disposal-based indicator—the per capita disposal rate—which

[3] California Legislative Information (CLI). 2011. *Assembly Bill No. 341*. Retrieved from: https://leginfo.legislature.ca.gov/faces/billNavClient.xhtml?bill_id=201120120AB341 Accessed October 8, 2024.

uses only two factors: (1) a jurisdiction's population (or in some cases employment) and (2) its disposal, as reported by disposal facilities. Each year, CalRecycle calculates each jurisdiction's per capita (per resident or per employee) disposal rates. If business is the dominant source of a jurisdiction's waste generation, CalRecycle may use the per employee disposal rate. Each year's disposal rate will be compared to that jurisdiction's 50 percent per capita disposal target. As such, jurisdictions will not be compared to other jurisdictions or the statewide average, but they will only be compared to their own 50 percent per capita disposal target. Among other benefits, per capita disposal is an indicator that allows for jurisdiction growth because, as residents or employees increase, report-year disposal tons can increase and still be consistent with the 50 percent per capita disposal target. A comparison of the reported annual per capita disposal rate to the 50 percent per capita disposal target will be useful for indicating progress or other changes over time.

Assembly Bill 1826

Assembly Bill 1826, also known as the Mandatory Commercial Organics Recycling (MORe) law of 2014, requires most businesses and multi-family complexes to recycle their organic waste dependent on weekly waste generation. Local jurisdictions across the state are required to implement an organic waste recycling program to divert organic waste generated by businesses, including multifamily residential dwellings that consist of five or more units.[4]

Senate Bill 1383

SB 1383 establishes targets for reductions in organic waste disposal in landfills and rescue of currently wasted surplus food. The goal was to reduce emissions of short-lived climate pollutants in various sectors of California's economy and find a sustainable alternative to disposing of organics in landfills. All businesses must comply with the law and enroll in an organic recycling program and utilize an organics cart for residential and commercial customers.[5]

CalGreen Code Section 4.408

The California Green Building Standards Code mandates that construction waste management must be recycled or salvaged for reuse at a minimum of 65 percent for nonhazardous construction and demolition waste and comply with local construction standards for demolition waste management when applicable. Exceptions to this include excavated soil and land-clearing debris, if recycling facilities capable of compliance with this item do not exist or are not located reasonably close to the jobsite, or if the enforcing agency makes exceptions when project sites are located in areas beyond the haul boundaries of the diversion facility.[6]

Local and Regional Regulations

Rialto General Plan

The General Plan Chapter 2, *Managing Our Land Supply Element* and Chapter 3, *Investing in Our Future: Economic Development, Redevelopment, and Infrastructure* provides guidance to promote the City's goals for current and future development related to solid waste, recycling, and infrastructure, including water

and wastewater systems. The following list includes General Plan goals and policies that have been adopted by the City for the purpose of avoiding or mitigating an environmental effect on the supply of water and are applicable to the proposed Project.[7]

Goal 2-29 **Protect and enhance Rialto's surface waters and groundwater basins.**

Policy 2-29.3 Design sidewalks, roads, and driveways to minimize impervious surfaces; provide flood control channels with permeable bottoms to help restore groundwater aquifers.

Policy 2-29.5 Apply methodologies and assign responsibility to protect the quality of groundwater from pollution by landfills and industrial uses.

Goal 2-30 **Conserve water resources.**

Policy 2-30.1 Require new development to use features, equipment, technology, landscaping, and other methods to reduce water consumption.

Goal 2-31 **Incorporate green building and other sustainable building practices into development projects.**

Policy 2-31.1 Explore and adopt the use of green building standards and Leadership in Energy and Environmental Design (LEED) or similar in both private and public projects.

Policy 2-31.2 Promote sustainable building practices that go beyond the requirements of Title 24 of the California Administrative Code, and encourage energy-efficient design elements, as appropriate.

Policy 2-31.3 Support sustainable building practices that integrate building materials and methods that promote environmental quality, economic vitality, and social benefit through the design, construction, and operation of the built environment.

Goal 2-35 **Achieve waste recycling levels that meet or exceed State mandates. Achieve maximum waste recycling in all sectors of the community: residential, commercial, industrial, institutional, and construction.**

Policy 2-35.2 Utilize source reduction, recycling, and other appropriate measures to reduce the amount of solid waste generated in Rialto that is disposed of in landfills.

Policy 2-35.3 Encourage the maximum diversion from landfills of construction and demolition materials through recycling and reuse programs.

Goal 3-8 **Promote affordable and quality water service capable of adequately meeting normal and emergency water demands to all areas in Rialto.**

Policy 3-8.1 Require that all new development or expansion of existing facilities bear the cost of expanding the water system to handle the increased demands which they are expected to generate.

Policy 3-8.10 Support water conservation through requirements for landscaping with drought-tolerant plants and efficient irrigation for all new development and City projects.

[7] City of Rialto. *The City of Rialto Focused General Plan Update 2024*. Retrieved from: https://www.rialtoca.gov/773/2023-City-of-Rialto-Focused-General-Plan. Accessed October 8, 2024.

Goal 3-9	**Upgrade and maintain an improved wastewater system with adequate plant efficiency and capacity to protect the health and safety of all Rialto residents, businesses, and institutions.**
Policy 3-9.1	Require that all new development or expansion of existing facilities bear the cost of expanding the wastewater disposal system to handle the increased loads which they are expected to generate.
Goal 3-10:	**Minimize the volume of solid waste that enters local and regional landfills.**
Policy 3-10.2:	Encourage the recycling of construction and demolition materials in an effort to divert these items from entering landfills.

Rialto Airport Specific Plan

The Rialto Airport Specific Plan was adopted by the City in November 1997. The Rialto Municipal Airport ceased operations in 2014 and the former airport property and many of the properties adjacent to the Rialto Municipal Airport that were suited to accommodate development were removed from the Rialto Airport Specific Plan and incorporated into the Renaissance Specific Plan, which was adopted by the City in 2010. Although the Rialto Municipal Airport is no longer operational, the Rialto Airport Specific Plan serves as the zoning ordinance for parcels that were not removed; these parcels are primarily northwest, west, and east of the former Rialto Municipal Airport. The Rialto Airport Specific Plan also provides a framework to guide future land use and development decisions in this area. The Rialto Airport Specific Plan does not contain specific policies related to utilities.

City of Rialto Municipal Code

Chapter 12.08 Sewer System. Connections to the City's sewer system are generally regulated by Title 12 (Public Utilities) of the Municipal Code. Chapter 12.08 establishes rules and requirements for connection to the sewer system and fees for waste deposit. The Chapter further regulates private sewer connections when connections to the public system are not feasible as well operation of private sewer systems.

Chapter 18.111 Wireless Telecommunications Facilities. This chapter provides the installation, modification, operation, and maintenance of wireless telecommunication facilities on public and private property consistent with State and federal law. Telecommunication facilities must ensure public safety, minimize the visual effects of telecom facilities on public streetscapes, protect public views, and otherwise avoid and mitigate the visual impacts of telecom facilities on the community.

Chapter 18.108, Regulation of Recycling Facilities. The requirements of Chapter 18.108 – Regulation of Recycling Facilities established guidelines and operating standards and procedures for the permitting of recycling facilities in the City. Recycling facilities may be located and operated in commercial and industrial zoning districts in conformance with Section 18.108.040.

2020 Upper Santa Ana River Watershed Integrated Regional Urban Water Management Plan

Pursuant to the UWMP Act, the City adopts the San Bernardino Valley Regional Urban Water Management Plan every five years. The current adopted plan is the 2020 Upper Santa Ana River Watershed Integrated Regional Urban Water Management Plan (IRUWMP).[8]

[8] San Bernardino Valley Municipal Water District, *2020 Upper Santa Ana River Watershed Integrated Regional Urban Water Management Plan.* Retrieved from: https://www.rialtoca.gov/DocumentCenter/View/1601/2020-Upper-Santa-Ana-River-Watershed-Integrated-Regional-Urban-Water-Management-Plan. Accessed July 11, 2024.

4.17.3 Existing Conditions

Water

The WVWD is located in the southwest region of San Bernardino County and serves the cities of Rialto, Fontana, Colton, and Jurupa Valley, and unincorporated areas of San Bernardino County. WVWD's total water service area encompasses approximately 31 square miles. Its service area is generally bordered by the City of Fontana to the west, the City of San Bernardino to the east, the U.S. Forest Service boundary to the north, and the County of Riverside to the south. The project site is located entirely within WVWD's northern service area section. WVWD's distribution system is divided into 8 pressure zones and uses 25 reservoirs for a total storage capacity of 72.6 million gallons (mg). WVWD also operates a 14.4 million gallons per day (mgd) water filtration facility.

There is existing domestic water infrastructure proximate to the project site. WVWD has an existing municipal water main that varies from 8 inches to 10 inches in Lowell Street and an existing 12-inch water main in Locust Avenue.

Purchased or Imported Water. WVWD purchases State Water Project (SWP) water from the San Bernardino Valley Municipal Water District. This water is put into the distribution system based on metered flows at the Lytle Turnout off the San Gabriel Pipeline Feeder. Metering and transmission facilities are sized to enable WVWD to purchase and treat up to 20 mgd (approximately 23,000 acre-feet per year (afy)). SWP water is treated at WVWD's Oliver P. Roemer Water Filtration Facility (Water Filtration Facility) and used for potable supply. WVWD is investigating the use of SWP water for groundwater recharge in the Lytle Creek Basin. In 2006, the Water Filtration Facility was expanded to increase production capacity to 14.4 mgd. In 2020, WVWD began the design of a 7.2 mgd expansion of the Water Filtration Facility to increase capacity to 21.6 mgd.

Groundwater. WVWD draws the majority of its supply from its wells from five regional groundwater basins: Bunker Hill and Lytle Creek (which are both part of the San Bernardino Basin), Rialto-Colton, Riverside North, and Chino Basins. These groundwater supply sources enter WVWD's distribution system based on metered flows at each well. All five basins have been adjudicated and are managed for long-term sustainability.

Surface Water. WVWD uses local surface water from the east side of the San Gabriel Mountains, including North Fork Lytle Creek, Middle Fork Lytle Creek, and South Fork Lytle Creek. WVWD has the right to divert and export out of the Lytle Creek Region at 2,290 gallons per minute (gpm) when it is available. WVWD can also purchase an additional 1,350 gpm of Lytle Creek flows through an agreement with the City of San Bernardino, which is treated at the Water Filtration Facility. WVWD also uses Lytle Creek surface water flows for groundwater recharge in the Lytle Creek Basin. When flows at the mouth of Lytle Creek Canyon drop below 7,182 gpm, all diversion rights holders must reduce their diversions to a prorated schedule set in the 1897 McKinley Decree entered in Los Angeles Superior Court Case No. 20,790. If WVWD is not receiving its full Lytle Creek surface water allotment, WVWD is permitted to make up the difference through additional pumping in the Lytle Creek Region.

Transfer Opportunities. WVWD has interconnections with the Fontana Water Company, Marygold Mutual Water Company, San Bernardino Valley Municipal Water District, and the cities of Rialto, Colton and San Bernardino, which can be used as needed for short-term supply needs.

Future Water Projects. To meet future demands within the system, WVWD plans to rehabilitate existing wells, drill new wells, and equip wells with wellhead treatment if required. These wells are planned for various groundwater basins and pressure zones within the distribution system. WVWD is expanding the Water Filtration Facility by 7.2 mgd for a total capacity of 21.6 mgd to allow additional treatment of SWP water, when available. When planning future water supply sources, WVWD selects projects that provide sufficient supply to meet peak day demands. When possible, these sources are planned by pressure zone, thereby reducing the need to lift water to a higher zone. As development progresses and increased demands are placed on the system, WVWD will determine which projects to implement. Although WVWD may not need to use each source to its full potential, construction of these water supply projects gives WVWD this option should one or more sources be offline due to maintenance. WVWD plans to collaborate with the other parties to implement groundwater recharge in the Rialto Basin to increase water levels. Increased water levels will result in an increase in WVWD's allowable pumping from the Rialto Basin, thereby increasing supply. The potential supply increase has not yet been quantified.

Recycled Water. Wastewater collected within WVWD's service area is treated by the cities of Rialto and Colton, San Bernardino County, and the Inland Empire Utilities Agency. In 2012, WVWD prepared a master plan to evaluate potential uses of recycled water within its service area. WVWD does not currently have a recycled water distribution system and is not pursuing recycled water use at this time because it is not cost effective to extend facilities from the wastewater treatment plants to the locations of potential use.

Service Area

The current and projected population for WVWD's water service area is shown in **Table 4.17 1: WVWD Water Service Area Projected Population**. The population projections were prepared as part of the IRUWMP. The 2020 population was determined using the DWR Geographic Information Systems (GIS) based tool (DWR Tool) to estimate the population within WVWD's service area using census data and the number of service connections. Future population was projected based on the 2020 WVWD Water Facilities Master Plan. Based on various growth rates identified in the Water Facilities Master Plan, it was estimated that population between 2020 and 2025 would grow at 2.84 percent, then reduce to an annual growth rate of 1.5 percent from 2025 through 2045.

Table 4.17-1: WVWD Water Service Area Projected Population Growth

	2020	2025	2030	2035	2040	2045
Service Area Population	89,101	102,490	110,410	118,943	128,136	138,039

Source: Locust Gateway Water Supply Assessment, 2025.

WVWD's available supplies for future years are summarized in **Table 4.17 2: Current and Projected Water Supplies**. These quantities are established in the IRUWMP.

Table 4.17-2: Current and Projected Water Supplies

Water Supply	Detail on Water Supply	2025	2030	2035	2040	2045
Groundwater	Bunker Hill (part of the San Bernardino Basin)	2,052	2,353	3,554	4,754	6,455
	Bunker Hill (part of the San Bernardino Basin, via Baseline Feeder)	5,000	5,000	5,000	5,000	5,000
	Lytle Creek (part of the San Bernardino Basin)	2,900	2,900	2,900	2,900	2,900
	Rialto-Colton	4,426	4,538	4,650	4,761	4,873
	Riverside-Arlington	2,500	3,000	3,500	4,000	4,000
	Chino	-	900	900	900	900
Purchased or Imported Water	SWP – Rialto Colton Groundwater Supplemental Supply	-	-	-	-	-
	SWP - Direct Delivery	7,000	7,000	7,000	7,000	7,000

	Total	**26,978**	**28,791**	**30,603**	**32,415**	**34,229**

Source: Locust Gateway Water Supply Assessment, 2025.

Wastewater

The City owns, operates, and maintains the local public sanitary sewer system, which includes a wastewater collection system and treatment plant. Wastewater is treated at the Rialto Wastewater Treatment Plant located at 501. E. Santa Ana Avenue in Rialto. The Rialto Wastewater Treatment Plant treats domestic and commercial/industrial wastewater generated in the City of Rialto and portions of the City of Fontana. The combined total treatment design capacity of the plant is 11.7 million gallons per day (mgd).[9] The City processes over 2 billion gallons of wastewater per year at the Wastewater Treatment Plant. Processing of sewage can be accomplished in numerous ways through mechanical, biological, and chemical treatment methods. Primary, secondary, and tertiary treatment standards reflect the degree by which the sewage has been treated. Primary treatment includes the removal of relatively large objects such as trash, rags, cans, and gravel. Secondary treatment involves the removal of biological solids such as fat, grease, human waste, soaps, and other organic materials. Tertiary treatment further clarifies wastewater utilizing chemical washes, biological decomposition, and disinfection. Tertiary treatment involves the removal of nitrates, phosphorus, pathogens, and other microorganisms.[10]

Tertiary treated water can be used as reclaimed water for irrigation and other uses that can rely on non-potable water. Reclaimed water is produced at the Wastewater Treatment Plant. However, there is no infrastructure for citywide use of recycled water for irrigation or other non-potable uses and there are no plans to install such infrastructure. The City's Utilities Division is responsible for maintaining over 150 miles of sewer mains. The collection method uses gravity flow through vitrified clay pipes that flow from

northwest to southeast. There is an existing 12-inch sewer line in Locust Avenue and an 8-inch sewer line in Lowell Street.

Dry Utilities– Electricity, Natural Gas, Telecommunications

Electricity

Southern California Edison Company (SCE) is the primary distribution provider for electricity in the City.[11] SCE services approximately 15 million people in a 50,000-square-mile service territory. SCE is a regulated electrical utility and maintains electrical facilities and infrastructure within the City and surrounding areas. SCE facilities and infrastructure are used to provide service to the City under the applicable rules and tariffs approved by the California Public Utilities Commission (CPUC), which is responsible for ensuring that California utilities' customers have safe and reliable utility service. SCE provides service in accordance with Tariff Rule 2 as authorized by the CPUC. In addition to the specific rule requirements, each service request is individually designed taking into consideration factors that include but are not limited to: the customer's projected electrical load, location of the customer's metering point, requested service voltage, reliability needs, proximity and delivery capacity of SCE's near-by facilities, potential for load expansions and future development of the SCE system.[12] There is an 11-foot-wide SCE easement on Locust Avenue parallel to the right-of-way. The SCE easement and the 5-foot-wide public utility easement on Lowell Street are shown on **Figure 11: Tentative Parcel Map** in **Section 3.0: Project Description**.

Natural Gas

The City is served by Southern California Gas Company (SoCalGas). SoCalGas serves approximately 21.1 million people in a 24,000-square mile service territory.[13] According to the California Energy Commission (CEC), natural gas demand in the SoCalGas service area was 5026 million therms in 2022 (most recent data).[14]

SoCalGas projects that total demand for natural gas will decline at an annual average rate of 2.0 percent per year through 2040.[15] The decline in demand is due to modest economic growth, the CPUC mandated energy efficiency standards and programs, tighter standards created by revised Title 24 Codes and Standards, renewable electricity goals, the decline in commercial and industrial demand, and conservation savings linked to Advanced Metering Infrastructure.

Telecommunications

Telecommunications are provided by multiple telecommunications companies that operate and maintain transmission and distribution infrastructure which currently serves the City.

Solid Waste

Burrtec Waste Industries provides trash collection and recycling services including hazardous waste disposal and recycling services to the City of Rialto. Burrtec transports solid waste to the San Bernardino County Department of Public Works Mid-Valley Sanitary Landfill located approximately one mile southwest of the project site at 2390 Alder Avenue. The Mid-Valley Sanitary Landfill has a maximum permitted throughput of 7,500 tons per day and the remaining capacity is 54,219,377 cubic yards. There is currently no solid waste generation at the project site since the site is vacant.

4.17.4 Methodology

Water

A Water Supply Assessment (WSA) was prepared by Water Systems Consulting, Inc. (January 2025) on behalf of the West Valley Water District (WVWD). The WSA is summarized in this section and is provided as **Appendix L** to this EIR. As required by Senate Bill 610 (SB 610), the WVWD is responsible for assessing whether the total projected water supplies available during average, single dry, and multiple dry water years during a 20-year projection will meet the projected water demand for the proposed Project, in addition to WVWD's existing and planned future uses. A water supplier's UWMP serves as a foundational document for a WSA. The water demands of the proposed Project were not accounted for in WVWD's IRUWMP (Water Systems Consulting, Inc. and Woodard & Curran, June 2021), as submitted to the DWR in June 2021. Updated projections were incorporated into the WSA to reflect the most recent supply and demand information. Additional information from other sources were also incorporated into this WSA to document supplies from all sources, including groundwater and purchased water. Documentation includes identifying and quantifying water rights, contracts, and/or entitlements to the supply. The WSA includes the following:

- Overview of WVWD's water system;
- Description of the Project and proposed water demand;
- Information on WVWD's current and projected water supplies;
- Comparison of WVWD's service area water supplies and water demands for average, single dry, and multiple dry years; and,
- Determination of the WVWD water service area water supply sufficiency.

Where significant impacts remain despite compliance with the regulatory framework, feasible mitigation measures are recommended, where warranted, to avoid or reduce the Project's potentially significant environmental impacts.

Wastewater

The Project is evaluated against the significance criteria/thresholds and information concerning current service levels and the ability of the service providers to accommodate the increased demand created by the proposed Project. The wastewater analysis identifies the types of wastewater that is anticipated to be generated by Project implementation and wastewater treatment requirements related to wastewater. Impacts would be considered significant if the proposed Project would not comply or would conflict with existing applicable wastewater regulations resulting in a significant environmental impact. Where significant impacts remain despite compliance with the regulatory framework, feasible mitigation measures are recommended, where warranted, to avoid or reduce the Project's potentially significant

environmental impacts. Refer to **Section 4.9: Hydrology and Water Quality** for information regarding the Project's impacts on drainage.

Dry Utilities – Electricity, Natural Gas, Telecommunications

The Project is evaluated against the significance criteria/thresholds and information concerning current service levels and the ability of the service providers to accommodate the increased demand created by the Project. This analysis addresses the Project's potential impacts on dry utility infrastructure, including electrical, natural gas, and telecommunications facilities. Where significant impacts remain despite compliance with the regulatory framework, feasible mitigation measures are recommended, where warranted, to avoid or reduce the Project's potentially significant environmental impacts. Energy consumption that would occur during both construction and operation of the Project and specific analysis methodologies was assessed in **Section 4.5: Energy**. Energy calculations are provided in **Appendix B** of this EIR and are based on the same assumptions used in **Section 4.2: Air Quality**, and **Section 4.7: Greenhouse Gas Emissions**.

Solid Waste

The Project is evaluated against the significance criteria/thresholds and information concerning current service levels and the ability of the service providers to accommodate the increased demand created by the proposed Project. Where significant impacts remain despite compliance with the regulatory framework, feasible mitigation measures are recommended, where warranted, to avoid or reduce the Project's potentially significant environmental impacts.

Landfill Capacity: The analysis of the proposed Project's impact on landfill facilities is based on the anticipated generation of solid waste that would occur during construction and operation of the Project. The analysis identifies the projected amount of non-hazardous construction debris and operational solid waste that would be generated from implementation of the Project and the amount that would be disposed of in landfills after compliance with recycling/diversion requirements. The proposed Project's impact regarding solid waste would be significant if the Project's anticipated solid waste generation would substantially affect landfill capacity, such that additional or expanded landfill facilities would be required to accommodate the Project.

Solid Waste Regulations: The analysis of the proposed Project consists of the Project's conformance of applicable solid waste regulations related to the generation or disposal of solid waste. Impacts would be considered significant if the proposed Project would not comply with all applicable federal, State, or local statutes or regulations related to solid waste.

4.17.5 Thresholds of Significance

The following significance criteria for utilities and service system impacts were derived from the Environmental Checklist in CEQA Guidelines Appendix G. The proposed Project would result in a significant impact if it would:

- Require or result in the relocation or construction of new or expanded water facilities, the construction or relocation of which could cause significant environmental effects.
- Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years.

- Require or result in the relocation or construction of new or expanded wastewater treatment facilities, the construction or relocation of which could cause significant environmental effects.
- Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments.
- Require or result in the relocation or construction of new or expanded electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects.
- Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals.
- Comply with federal, State, and local management and reduction statutes and regulations related to solid waste.

4.17.6 Project Impacts and Mitigation

Water

Threshold 4.17-1:	**Would the Project require or result in the relocation or construction of new or expanded water facilities, the construction of which could cause significant environmental effects?**
	Level of Significance: Less than Significant Impact

Water infrastructure for domestic water, fire protection, and landscape irrigation would be extended to the site from Lowell Street, and water infrastructure for fire protection would be extended to the site from Locust Avenue. The proposed Project would receive water supplies from WVWD through the existing 12-inch water main in Locust Avenue and the existing 8-inch to 10-inch water main in Lowell Street. For the Project's proposed 12-inch water connection to the water main in Lowell Street, either the Project would connect to the existing 10-inch portion of the existing water main or the existing 10-inch main would be replaced with a 12-inch water main. WVWD would be responsible for the review of water infrastructure design plans and would determine if the existing water line in Lowell Street requires replacement during final engineering. The City would provide an encroachment permit for the construction/installation of required infrastructure in the public right-of-way.

Construction activities related to the new on-site and off-site water infrastructure would occur within areas that would be disturbed for other aspects of the proposed Project. The water infrastructure would be installed as part of grading, building construction, and installation of other utilities. The proposed off-site connections to water mains would occur within roadway rights-of-way that would be provided as part of the implementation of the proposed Project. Reconstruction or replacement of the water line would occur within the same location both horizontally and vertically in Lowell Street. The installation of off-site water infrastructure is assumed as part of the impact analysis for the proposed Project. Therefore, impacts related to water infrastructure would be less than significant and no additional mitigation is required.

Threshold 4.17-2:	**Would the Project have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?** ***Level of Significance:*** Less than Significant Impact

The Locust Gateway WSA was prepared for the proposed Project to satisfy the requirements of SB 610. As required by SB 610, the WVWD is responsible for assessing whether the total projected water supplies available during average, single dry, and multiple dry water years during a 20-year projection will meet the projected water demand for the Project, in addition to WVWD's existing and planned future uses. The findings of the WSA are summarized below and the WSA is provided as **Appendix L** to this EIR.

Project Water Demand

The City designates the project site's land use as industrial which corresponds to the 2020 WVWD Water Facilities Master Plan's industrial water demand factor category. The Rialto Airport Specific Plan designates the property as General Manufacturing. To provide consistency with previous WVWD WSAs prepared for warehouse uses, the heavy industrial demand factor was used to provide a conservative estimate. The estimated heavy industrial water demand factor applied is provided in **Table 4.17-3: Project Water Demand**. The WSA identified that the Project's water demand would be approximately 68 afy.

Table 4.17-3: Project Water Demand

Use	Area (Acres)	Demand Factor (gpd/ac)	Demand (afy)
Heavy Industrial	39.91	1,530	68
gpd/ac; gallons per day per acres; ac = acre; afy = acre-feet per year			
Source: Locust Gateway Water Supply Assessment, 2025.			

Table 4.17-4: Historic and Projected Water Demand identifies the IRUWMP historical and projected demands by customer class, which includes cumulative projects. The Project's water demand was compared to the demands projected within the IRUWMP starting in 2025; the net Project demand is included in the table. The IRUWMP reports projections every five years (2025, 2030, 2035, 2040, and 2045). The IRUWMP projected a 94 AFY increase of industrial demands from 2020 to 2025, which is more than the Project's water demand.

Table 4.17-4: Historic and Projected Water Demand

Customer Class	Demand, AFY[1, 2]					
	2020	2025	2030	2035	2040	2045
Single-Family[3]	12,049	13,715	14,647	15,578	16,509	17,440
Multi-Family	481	553	591	628	665	702
Commercial	1,689	1,943	2,073	2,204	2,334	2,465
Industrial[4]	623	1,115	1,282	1,330	1,378	1,426
Institutional[5]	860	972	1,039	1,105	1,172	1,238
Landscape Irrigation	2,161	2,485	2,652	2,819	2,986	3,153
Hydrant	272	313	334	355	376	397
Golf Course	-	-	-	-	-	-

Table 4.17-4: Historic and Projected Water Demand						
Fire Service	5	5	6	6	7	7
Agricultural Irrigation	70	81	86	92	97	103
Water Losses	1,889	2,513	2,682	2,851	3,020	3,189
Total[6]	**20,099**	**23,694**	**25,391**	**26,967**	**28,543**	**30,119**

1. Demand for 2020 provided in Table 10-3 of the IRUWMP
2. Demand for 2025 – 2045 provided in Table 10-5 of the IRUWMP.
3. Single-family demands here differ from the IRUWMP because they exclude the existing 144 AFY single-family use of the Bloomington Business Park site to be redeveloped.
4. Industrial demands here differ from the IRUWMP because they include the demands from the Pepper Commerce Center (119 AFY) and Bloomington Business Park (236 AFY), WSAs prepared after the IRUWMP.
5. Institutional demands here differ from the IRUWMP because they exclude the existing institutional use of 17 AFY from the Bloomington Business Park WSA site to be redeveloped.
6. Demand totals updated to reflect the changes to the IRUWMP projections.

Source: Locust Gateway Water Supply Assessment, 2025.

Water Supply and Demand

As a part of the IRUWMP, the WVWD estimated that water demands could increase by 10 percent during a single dry year. During a multiple dry year period and to provide for the most conservative estimate, the IRUWMP assumed that demand could continue to exhibit a 10 percent increase although it is expected that conservation messaging and restrictions would help reduce overall consumption.

Table 4.17-5: Normal Year Supply and Demand Comparison provides a comparison of supply and demand projections for a normal year including the IRUWMP, proposed Project demand, and other WSA demands. **Table 4.17-6: Single Year Supply and Demand Comparison** identifies the supply and demand projections for a single dry year.

Table 4.17-5: Normal Year Supply and Demand Comparison					
Totals	**2025**	**2030**	**2035**	**2040**	**2045**
Supply Totals	26,978	28,791	30,603	32,415	34,229
Demand Totals	23,764	25,459	27,035	28,612	30,188
Difference	3,214	3,332	3,568	3,803	4,041

Notes: Supply information provided in the IRUWMP Table 10-12. Demand totals updated to reflect addition of net Project demand and additional demands identified in WSAs developed subsequent to the IRUWMP including the Bloomington Business Park (236 AFY) and Pepper Commerce Center (119 AFY).

Source: Locust Gateway Water Supply Assessment, 2025.

Table 4.17-6: Single Year Supply and Demand Comparison					
Totals	**2025**	**2030**	**2035**	**2040**	**2045**
Supply Totals	29,676	31,670	33,663	35,657	37,651
Demand Totals	26,110	27,963	29,697	31,430	33,164
Difference	3,566	3,707	3,966	4,227	4,487

Notes: Supply information provided in the IRUWMP Table 10-12. Demand totals updated to reflect addition of net Project demand and additional demands identified in WSAs developed subsequent to the IRUWMP including the Bloomington Business Park (236 AFY) and Pepper Commerce Center (119 AFY). WVWD's demands in single dry years are assumed to increase by 10% above normal year demands.

Source: Locust Gateway Water Supply Assessment, 2025.

Table 4.17-7: Multiple Dry Year Supply and Demand Comparison identifies the supply and demand for multiple dry years. The water demands presented in these tables differ from the IRUWMP in order to show the demand required to serve the Project (68 afy) and the additional demands identified in WSAs prepared subsequent to the IRUWMP.

According to the IRUWMP, WVWD has adequate supplies to meet its customer demands and replacement water needs during average, single dry, and multiple dry years throughout the planning period. Even with the addition of the Project demands and the water demands of the cumulative projects noted in the tables, to the projected demands established in the IRUWMP, WVWD anticipates sufficient supply to serve the Project with additional surplus supply for as-needed use. The WVWD has adequate supplies to meet demands during average, single dry, and multiple dry years throughout the planning period. Impacts would be less than significant and no mitigation is required.

Table 4.17-7: Multiple Dry Year Supply and Demand Comparison

Year	Totals	2025	2030	2035	2040	2045
First Year	Supply Totals	29,676	31,670	33,663	35,657	37,651
	Demand Totals	25,873	27,963	29,697	31,430	33,164
	Difference	**3,803**	**3,707**	**3,966**	**4,227**	**4,487**
Second Year	Supply Totals	29,676	31,670	33,663	35,657	37,651
	Demand Totals	25,873	27,963	29,697	31,430	33,164
	Difference	**3,803**	**3,707**	**3,966**	**4,227**	**4,487**
Third Year	Supply Totals	29,676	31,670	33,663	35,657	37,651
	Demand Totals	25,873	27,963	29,697	31,430	33,164
	Difference	**3,803**	**3,707**	**3,966**	**4,227**	**4,487**
Fourth Year	Supply Totals	29,676	31,670	33,663	35,657	37,651
	Demand Totals	25,873	27,963	29,697	31,430	33,164
	Difference	**3,803**	**3,707**	**3,966**	**4,227**	**4,487**
Fifth Year	Supply Totals	29,676	31,670	33,663	35,657	37,651
	Demand Totals	25,873	27,963	29,697	31,430	33,164
	Difference	**3,803**	**3,707**	**3,966**	**4,227**	**4,487**

Notes: Supply information provided in the IRUWMP Table 10-12. Demand totals updated to reflect addition of net Project demand and additional demands identified in WSAs developed subsequent to the IRUWMP including the Bloomington Business Park (236 AFY) and Pepper Commerce Center (119 AFY). WVWD's demands in dry years are assumed to increase by 10% above normal year demands.

Source: Locust Gateway Water Supply Assessment, 2025.

Wastewater

Threshold 4.17-3: **Would the Project require or result in the relocation or construction of new or expanded wastewater treatment facilities, the construction of which could cause significant environmental effects?**

Threshold 4.17-4: **Would the Project result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?**

***Level of Significance*:** Less than Significant Impact

The Project would construct an 8-inch sewer PVC pipe along the eastern portion of the project site that would flow to an on-site private sewer lift station. The flows would then be pumped to a gravity manhole that would discharge to an existing 8-inch sewer in Lowell Street. The City would be responsible for the review of wastewater infrastructure design plans and would provide an encroachment permit for the construction/installation of required infrastructure in the public right-of-way. Wastewater from the Project would be conveyed to and treated at the Rialto Wastewater Treatment Plant. The design capacity of the Rialto Wastewater Treatment Plant is permitted for 11.7 mgd of treatment capacity and treats an average of 7 to 8 mgd with 4 to 5 mgd remaining capacity. Based on wastewater generation rates from the Rialto Master Sewer Study, the Project would generate 60,000 gpd of wastewater or 67.2 acre feet per year (1,500 gpd/acre × 40 acres = 60,000 gpd). Projected wastewater demand for the Project would account for less than one percent of the daily treatment volume at the Wastewater Treatment Plant. This increase is nominal compared to the combined residual capacity of the treatment plant. Therefore, existing wastewater treatment facilities would accommodate the project-generated wastewater and continue to maintain a substantial amount of remaining capacity for future wastewater treatment. Further, the City's General Plan EIR evaluated wastewater demand based on the proposed land use and zoning identified for the project site. The Project is consistent with the land use designation and zoning for the project site. Lastly, the City of Rialto has provided a Will Serve letter dated September 19, 2024, stating that the City can provide sewer service to the proposed Project.

Therefore, the Project would not require expansion or relocation of a wastewater facility as there is sufficient capacity at the Wastewater Treatment Plant to serve the Project. Further, the City collects development impact fees, specifically Sewer Frontage fees and Sewer Treatment fees, from new development under Ordinance No. 1532. Collection of fees would also fund future expansion of wastewater infrastructure facilities as needed. Therefore, impacts would be less than significant and no mitigation is required.

Dry Utilities– Electricity, Natural Gas, Telecommunications

Threshold 4.17-6:	**Would the Project require or result in the relocation or construction of new or expanded electric power, natural gas, or telecommunication facilities, the construction of which could cause significant environmental effects?**
	***Level of Significance*:** Less than Significant Impact

SoCalGas and SCE provide natural gas and electric power services to the area. These service providers install and maintain mainline systems throughout the City. Several companies provide telecommunications. Project construction would use approximately 0.0080 gigawatt-hours (GWh) of electricity, 35,998 gallons of gasoline, and 97,770 gallons of diesel. Project operations would annually use approximately 0.958 GWh of electricity, 0 therms of natural gas, 180,492 gallons of gasoline, and 728,982 gallons of diesel upon implementation of MM AQ-2 through MM AQ-5, MM GHG-1, MM GHG-2, and MM GHG-4; see **Section 4.5: Energy**.

Electricity

SCE currently operates electric power in the City through electricity distribution lines in both aboveground and buried lines. The Project would connect to existing SCE lines which would enable services to the site. Although some new utility infrastructure may be required on the site, extension of services is not

anticipated to require the construction of any new off-site electric power facilities in order to serve the project site. The Project Applicant would be required to coordinate with SCE to prevent disruption of service while electrical infrastructure is extended to the project site. Impacts would be than significant and mitigation is not required.

Natural Gas

As identified in **Section 4.2: Air Quality**, Mitigation Measure (MM) AQ-2 requires the Project to use all-electric appliances and end uses instead of natural gas. MM AQ-2 also requires that the Project not include natural gas utility lines or connections. Although there are natural gas lines in the area, natural gas infrastructure would not be extended to the project site. Therefore, no impact would occur related to natural gas and no mitigation is required.

Telecommunications

The project site would require telecommunication services, which are provided by private purveyors. There are existing telecommunication lines located within existing adjacent rights-of-way that serve the existing surrounding development. Service to the project site would require tying into these lines but these improvements would occur within existing areas of disturbance such as those adjacent to existing roadways. Any upgrades to existing telecommunication facilities and the construction of new facilities to meet the demand of users would be determined by the service provider. However, the construction of substantial new telecommunication infrastructure is not assumed to be required. These impacts would be less than significant and no mitigation is required.

Solid Waste

Threshold 4.17-5:	**Would the Project generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?**
Threshold 4.17-6:	**Would the Project comply with federal, State, and local management and reduction statutes and regulations related to solid waste.**
	***Level of Significance*:** Less than Significant Impact

Construction

Site preparation (vegetation removal and grading activities) and construction activities would generate typical construction debris, including wood, paper, glass, metals, cardboard, and green waste. Non-salvaged construction and demolition waste would result in an incremental and intermittent increase in solid waste disposal at the Mid-Valley Sanitary Landfill.

Mid-Valley Sanitary Landfill has a maximum daily intake capacity of 7,500 tons per day.[16] Therefore, the landfill would support a temporary increase in solid waste during construction of the Project. Recycling of construction debris would reduce the potential amount of waste disposed of at the Mid-Valley Sanitary Landfill and would contribute to the recycling goals set forth by the City, the CBC, and AB 939. Construction activities would be required to comply with all federal, State, and local statutes and regulations related to

[16] CalRecycle. 2024. SWIS Facility/Site Activity Details. Retrieved from: https://www2.calrecycle.ca.gov/SolidWaste/SiteActivity/Details/1880?siteID=2662. Accessed August 12, 2024.

solid waste. As a result, impacts associated with short-term solid waste would be less than significant and no mitigation is required.

Operations

As of August 2024, the Mid-Valley Sanitary Landfill has a remaining capacity of approximately 54,219,377 cubic yards. Based on a generation rate of 41.64 pounds per employee per day for industrial uses, the Project would generate approximately 11.6 tons per day.[17] This accounts for less than one percent of the maximum daily capacity of the Mid-Valley Sanitary Landfill. The existing landfill would have sufficient capacity to serve the proposed Project and solid waste generated during construction and operations would represent a nominal increase compared to the daily permitted tonnage at the landfill. Compliance with all applicable regulations and laws regarding solid waste would further reduce impacts. Therefore, impacts are less than significant and no mitigation is required.

The Project would comply with applicable local, State and federal regulations regarding solid waste, including those of the City of Rialto. Regulations specifically applicable to the proposed Project include the California Integrated Waste Management Act of 1989 (AB 939), AB 1826, SB 2022, SB 1383, SB 1019, CalGreen Code Section 4.408, AB 341, and the City's Municipal Code Section 8.08. The regulatory framework is described above in the regulatory setting and details what requirements the Project must follow to be compliant. The City's Municipal Code Section 8.08 outlines policies and regulations regarding solid waste handling and recycling for both customers and collectors in the City. In accordance with Municipal Code Section 8.08, the Project would maintain a sufficient number of containers to hold all solid waste; deposit all solid waste, including gray container waste, non-organic recyclables, and organic waste generated or accumulated on the premises into the proper containers; and cleanup of any and all solid waste generated, accumulated, or spilled on the premises prior to collection. Compliance with the above-mentioned policies and programs would ensure that the Project would not conflict with federal, State and local statutes and regulations related to solid waste. Further, the General Plan contains a goals and policies related to solid waste and recycling. Following adherence to these federal, State and local statutes and regulations related to solid waste, impacts would be less than significant and no mitigation is required.

4.17.7 Cumulative Impacts

For purposes of public utilities and service systems, cumulative impacts are considered for projects on a system-wide basis and are associated with the capacity of existing and planned infrastructure from local responsible agencies. As addressed in this section of the EIR, the Project would not result in significant impacts to utilities and service systems in consideration of compliance with existing laws, ordinances, regulations and standards.

With respect to water, as previously addressed, the WSA evaluated the water demand of the proposed Project as well as the projected demands as set forth in the IRUWMP and WSAs prepared subsequent to the preparation of the IRUWMP. The WVWD has determined that it will be able to provide adequate water supplies to meet the potable water demand for this Project in addition to existing and future uses during average, single dry, and multiple dry years. Impacts related to a cumulatively considerable increase in water supply demands would be less than significant and no mitigation is required.

[17] CalRecycle, *Estimated Solid Waste Generation Rates.* Retrieved from: https://www2.calrecycle.ca.gov/WasteCharacterization/General/Rates. Accessed August 12, 2024. Note: [41.64(lb/employee/day) x 557(employee)] ÷ 2000(lb/ton) = 11.59(ton/employee/day)

With respect to wastewater, given the existing available capacity at the Rialto Wastewater Treatment Plant, the wastewater treatment needs of the Project, when combined with past, presents, and reasonably foreseeable future projects within the vicinity of the project site, would not result in the need for new or expanded wastewater treatment facilities that could result in significant environmental impacts or exceed the capacity of the wastewater treatment facilities. Furthermore, the Project would have adequate wastewater capacity to serve the Project and reasonably foreseeable future development. All projects within the vicinity of the Project would be required to comply with applicable federal, State, and local regulations that would minimize environmental impact and prevent a cumulatively considerable significant impact from occurring. No significant impact is anticipated with respect to wastewater capacity, and the Project's contribution is not cumulatively considerable. Therefore, the cumulative impact relating to wastewater treatment would be less than significant and no mitigation is required.

With respect to dry utilities, the Project would result in a less than significant impact related to dry utilities. Regarding cumulative impacts, the electric power and telecommunication needs of the Project, when combined with past, present, and reasonably foreseeable future projects within the vicinity of the project site, would not result in the relocation or construction of new or expanded electric power or telecommunication facilities that could result in significant environmental impacts or exceed the capacity of the electricity, natural gas, and telecommunication providers. All projects within the vicinity of the Project would be required to comply with applicable federal, State, and local regulations that would minimize environmental impacts and prevent a cumulatively considerable significant impact from occurring. Based on the foregoing, no significant cumulative impact is anticipated with respect to dry utilities, and the Project's contribution is not cumulatively considerable. Therefore, the cumulative impact relating to electric power and telecommunication facilities would be less than significant and no mitigation is required.

With respect to landfills and solid waste, potential future projects in the City would increase solid waste generation and decrease available capacity at the Mid-Valley Sanitary Landfill and other landfills within the County. However, as with the proposed Project, these projects would be subject to environmental review prior to construction and comply with federal, State and local regulations to minimize water, wastewater and solid waste impacts. Additionally, the Mid-Valley Sanitary Landfill is projected to have sufficient capacity to serve current and future needs until its scheduled closure in 2045. The Project would not result in a significant impact and combined with other projects within the vicinity would not result in cumulatively considerable significant impacts to solid waste standards, infrastructure, or reduction goals. Furthermore, the Project would comply and it is expected that projects within the vicinity of the project site would also comply with federal, State, and local management and reduction statutes and regulations related to solid waste. Therefore, a cumulatively considerable significant impact is not expected with respect to solid waste and no mitigation is required.

Therefore, there are no significant cumulative impacts anticipated relative to utility and service systems, and the Project's contribution toward potential future utility and service system impacts is not cumulatively considerable.

4.17.8 Mitigation Program

Standard Conditions

No standard conditions are applicable.

Mitigation Measures

No mitigation measures are required.

4.17.9 Level of Significance After Mitigation

No significant impact would occur and no mitigation is required.

5.0 OTHER CEQA CONSIDERATIONS

5.1 EFFECTS FOUND NOT TO BE SIGNIFICANT

CEQA provides that an EIR focus on the significant effects on the environment, discussing the effects with emphasis in proportion to their severity and probability of occurrence. The City of Rialto, as the lead agency for the Locust Gateway Development Project (proposed Project), is subject to specific environmental review under CEQA. CEQA Guidelines Section 15063 provides that if a lead agency determines that an EIR will clearly be required for a project, an Initial Study is not required. In this case, the City determined that an EIR will need to be prepared based on the Project's potential to create short-term, long-term, and cumulative impacts. California Public Resources Code (PRC) §21100 (c) states that an EIR shall contain a statement briefly indicating the reasons that a project's various possible significant effects were determined not to be significant and were, therefore, not discussed in detail in the Draft EIR (PRC §21000 et. seq.). The Draft EIR further evaluates all of the Project's possible significant effects in accordance with the CEQA Guidelines. Where it was determined that the Project would have "less than significant impact" or "no impact," these threshold issues have not been addressed in the EIR, except to be identified in this section. The following identifies the threshold and a discussion of why the "less than significant" or "no impact" determination was reached.

5.1.1 Aesthetics and Visual Resources

The CEQA Guidelines ask for an evaluation of the following:

- Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State Scenic Highway?

There are no officially designated State scenic highways in or proximate to the City.[1] The nearest officially designated scenic highway is State Route 38 (Rim of the World Scenic Byway), located approximately 33 miles east of the project site.[2] Therefore, since the project site is not within the vicinity of any designated or eligible State scenic highways, the Project would not substantially damage scenic resources within a State scenic highway. No impact would occur and this threshold question is not addressed further in the EIR.

5.1.2 Agriculture and Forestry Resources

The CEQA Guidelines ask for an evaluation of the following:

- Would the project convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?
- Would the project conflict with existing zoning for agricultural use, or a Williamson Act contract?
- Would the project conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?

[1] California Department of Transportation. *List of eligible and officially designated State Scenic Highways*. Retrieved from: https://dot.ca.gov/programs/design/lap-landscape-architecture-and-community-livability/lap-liv-i-scenic-highways. Accessed October 20, 2024.

[2] Ibid.

- Would the project result in the loss of forest land or conversion of forest land to non-forest use?
- Would the project involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?

The project site does not contain Prime Farmland, Unique Farmland, or Farmland of Statewide Importance.[3] No portion of the project site is covered by a Williamson Act Contract.[4] Additionally, the area does not include forest resources, including timberlands, and is not zoned for agriculture use.[5] Therefore, the Project would result in no impact concerning mapped farmlands, Williamson Act Contracts, agricultural, forest, or timberland zoning, or the conversion or loss of Farmland, forest land, or timberland. For this reason, no impact would occur and this topic is not addressed further in the EIR.

5.1.3 Biological Resources

The CEQA Guidelines ask for an evaluation of the following:

- Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State habitat conservation plan?

The project site is not located with an active Habitat Conservation Plan (HCP) or Natural Community Conservation Plan (NCCP) area[6]. For this reason, no impact would occur and this threshold question is not further addressed in the EIR.

5.1.4 Geology and Soils

The CEQA Guidelines ask for an evaluation of the following:

- Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving the rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

There are no known active or potentially active faults at the project site, and the site is not within an Alquist-Priolo Earthquake Fault Zone as designated by the California Department of Conservation, California Geological Survey (CGS). The closest known fault to the site is the San Jacinto fault, which is mapped about 1.4 miles to the northeast[7]. Therefore, the Project would not directly, or indirectly, cause potential substantial adverse effects involving rupture of a known earthquake fault. For this reason, no impact would occur and this threshold question is not addressed further in the EIR.

- Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving landslides?

---

5 City of Rialto. 2013. *City of Rialto Zoning Map*. Retrieved from: https://www.rialtoca.gov/DocumentCenter/View/1513/Zoning-Map---July-2013. Accessed October 22, 2024.

6 Rocks Biological Consulting. 2025. *Biological Technical Report*. Included as **Appendix D** to this EIR.

7 California Department of Conservation, California Geological Survey. November 2024. *California Earthquake Hazards Zone Application.* Retrieved from: https://maps.conservation.ca.gov/cgs/informationwarehouse/eqzapp/. Accessed October 22, 2024.

The project site has an average elevation of approximately 1,620 feet above mean sea level. Due to the area's relatively flat topography, landslides are not anticipated. The project site is not located in a zone identified as being susceptible to landslides by the County of San Bernardino.[8] Therefore, given landslides are not anticipated due to the project site's location and topography, Project implementation would not expose people or structures to potential substantial adverse effects involving landslides, and no loss, injury, or death involving landslides would occur. For this reason, no impact would occur and this threshold question is not addressed further in the EIR.

- Would the project have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?

The Project would connect to the City's existing sewer system and would not include the use of septic tanks or alternative wastewater disposal systems. Therefore, the Project would have no impact concerning soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater. For this reason, no impact would occur and this threshold question is not further addressed in the EIR. **Section 4.17: Utilities** of this EIR addresses wastewater service and facilities.

5.1.5 Hazards and Hazardous Materials

The CEQA Guidelines ask for an evaluation of the following:

- For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?

There are no public airports or public use airports located within two miles of the project site. The closest airport is the San Bernardino International Airport, which is approximately 10 miles southeast of the project site. The Rialto Municipal Airport Final Comprehensive Plan (January 1991) is no longer applicable as the airport closed in 2014. The project site is not located within an area subject to an airport land use plan. Therefore, the Project would not result in an airport-related safety hazard or excessive noise for people residing or working in the project area. For this reason, no impact would occur and this threshold question is not further addressed in the EIR.

- Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires.

Fire Hazard Severity Zones (FHSZs) are mapped by the California Department of Forestry and Fire Protection (CAL FIRE) as set forth in Public Resources Code Sections 4201-4204 and Government Code Sections 51175-51189. FHSZs are categorized fire protection within a Federal Responsibility Area under the jurisdiction of a federal agency, a State Responsibility Area (SRA) under the jurisdiction of CAL FIRE, or within a Local Responsibility Area under the jurisdiction of a local agency. CAL FIRE is responsible for fire protection within SRAs. CAL FIRE defines an SRA as land that is not federally owned, not incorporated, does not exceed a housing density of three units per acre, contains wildland vegetation as opposed to agriculture or ornamentals, and has watershed value and/or has range/forage value (this effectively eliminates most desert lands). Where local fire protection agencies, such as the Rialto Fire Department,

[8] County of San Bernardino. 2020. *HZ-2 Liquefaction & Landslides*. Retrieved from: https://www.arcgis.com/apps/webappviewer/index.html?id=5864a434814c4e53adc74101b34b1905. Accessed July 14, 2024.

are responsible for wildfire protection, the land is classified as a Local Responsibility Area (LRA). The project site and its adjacent areas are classified as a Non-VHFHSZ (non-very high FHSZ). Therefore, the Project would not result in exposing people or structures to a significant risk of loss, injury or death involving wildland fires. For this reason, no impacts would occur and this threshold questions is not further addressed in the EIR.

5.1.6 Land Use and Planning

The CEQA Guidelines ask for an evaluation of the following:

- Would the project physically divide an established community?

The Project could have a significant environmental impact if it were sufficiently large or otherwise configured in such a way as to create a physical barrier or other physical division within an established community. For example, the construction of a highway through an existing community could constrain travel from one side of the community to another, as well as the cohesiveness of that community.

The proposed Project would develop a speculative warehouse building with three new driveways on Lowell Street, one driveway on Locust Avenue, and one emergency vehicle only driveway on Lake Padden Lane. As described above, the project site would be located in an area with predominantly planned and developed industrial, warehouse, manufacturing, and office uses. The project site is bordered by Lowell Street and industrial, office, and warehouse uses to the north; industrial uses, Locust Avenue, and an undeveloped parcel and single-family residences to the east; industrial, warehouse, and manufacturing uses to the south; and Lake Padden Lane, industrial and manufacturing uses, and Mid-Valley Landfill to the west. The residential neighborhood is approximately 700 feet east of Locust Avenue. The site does not currently provide any connection to the residential neighborhood nor does it provide connectivity or accessibility to other surrounding uses. The Project would include roadway and utility improvements along Lowell Street and Locust Avenue adjacent to the project site, including sidewalks, curb and gutter, restriping, pavement replacement, and utility connections. Project improvements would not include features such as a highway, new roadway, or above-ground infrastructure that would preclude or impede movement through the project site such that a permanent disruption in the physical arrangement of the surrounding community or isolation of that community would occur. The Project is consistent with the existing General Plan designation and zoning and would be compatible with the existing industrial uses adjacent to the site. As such, neither the residential neighborhood nor other existing or planned communities proximate to the project site would be physically divided by the proposed Project. Therefore, the proposed Project would not physically divide an established community and no impact would occur. For this reason, this threshold question is not further addressed in the EIR.

5.1.7 Noise

The CEQA Guidelines ask for an evaluation of the following:

- For a Project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

There are no private airstrips or airports located immediately adjacent to or near the project site. The closest airport is the San Bernardino International Airport, which is located approximately 10 miles southeast of the project site. The project site is not subject to an airport land use plan. Therefore, the Project would not expose people residing or working in the project area to excessive airport or airstrip-

related noise levels. No impact would occur. For this reason, this threshold question is not further addressed in the EIR.

5.1.8 Population and Housing

The CEQA Guidelines ask for an evaluation of the following:

- Would the Project displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?

The project site is vacant; there is no housing on the site. Therefore, Project implementation would not create an impact that would displace people or housing. For this reason, no impact would occur and this threshold question is not further addressed in the EIR.

5.1.9 Public Services

The CEQA Guidelines ask for an evaluation of the following:

- Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services: schools, parks, and other public facilities including libraries?

Implementation of the Project would not create a direct demand for public school services; no residential uses are proposed. The addition of employment-generating uses on the project site would assist the City in achieving its goal to provide a better jobs/housing balance within the City (allowing more City residents to work in the City rather than commuting elsewhere). The Project is not expected to draw a substantial number of new residents to the region and would therefore not indirectly generate a substantial number of new school-aged students in the City requiring public education. Because the Project would not directly generate students and is not expected to indirectly draw students to the area, the Project would not cause or contribute to a need to construct new or physically altered public school facilities. Although the Project would not create a demand for additional public school services, the Project Applicant would be required to contribute development impact fees to the Rialto Unified School District in compliance with Senate Bill 50, which allows school districts to collect fees from new developments to offset the costs associated with increasing school capacity needs. Mandatory payment of school fees would be required prior to the issuance of a building permit. For this reason, impacts to public schools would be less than significant, this threshold question is not further addressed in the EIR.

The proposed Project does not include any residential uses and would not directly create a demand for public park facilities and would not result in the need to modify existing or construct new park facilities. For this reason, no impact would occur and this threshold question is not further addressed in the EIR.

5.1.10 Recreation

The CEQA Guidelines ask for an evaluation of the following:

- Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

- Would the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

The proposed Project does not include the development of any residences or recreational facilities, which would directly increase population and result in increased demand for parks and recreational facilities resulting in the need for new or expanded existing off-site recreational facilities. The collection of taxes and payment of development impact fees as outlined in Rialto Municipal Code Title 3 contributes to the funding of recreational facilities. For this reason, no impact would occur and this topic is not further addressed in the EIR.

5.1.11 Wildfire

The CEQA Guidelines ask for an evaluation of the following:

- If located in or near State Responsibility Areas or lands classified as Very High Fire Hazard Severity Zones, would the project:
  - a) Substantially impair an adopted emergency response plan or emergency evacuation plan.
  - b) Due to slope, prevailing winds, and other factors, exacerbate wildlife risks, and thereby expose Project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire.
  - c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment.
  - d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides as a result of runoff, post-fire slope instability, or drainage changes.

Fire Hazard Severity Zones (FHSZs) are mapped by the California Department of Forestry and Fire Protection (CAL FIRE) as set forth in Public Resources Code Sections 4201-4204 and Government Code Sections 51175-89. FHSZs are categorized fire protection within a Federal Responsibility Area under the jurisdiction of a federal agency, a State Responsibility Area (SRA) under the jurisdiction of CAL FIRE, or within a Local Responsibility Area (LRA) under the jurisdiction of a local agency. CAL FIRE is responsible for fire protection within SRAs. CAL FIRE defines an SRA as land that is not federally owned, not incorporated, does not exceed a housing density of three units per acre, contains wildland vegetation as opposed to agriculture or ornamentals, and has watershed value and/or has range/forage value (this effectively eliminates most desert lands). Where local fire protection agencies, such as the Rialto Fire Department, are responsible for wildfire protection, the land is classified as a Local Responsibility Area (LRA). LRAs are incorporated cities, urban regions, agricultural lands, and portions of the desert where the local government is responsible for wildfire protection. The project site and its adjacent areas are classified as a Non-VHFHSZ (non-very high FHSZ).[9] For this reason, no impact would occur and this topic is not further addressed in the EIR.

5.2 SIGNIFICANT AND UNAVOIDABLE IMPACTS

Section 15126.2(b) of the CEQA Guidelines requires that the EIR describe any significant impacts, including those that can be mitigated but not reduced to less than significant levels. The environmental effects of

[9] CAL FIRE. 2025. *Fire Hazard Severity Zones Map*. Retrieved from: https://osfm.fire.ca.gov/what-we-do/community-wildfire-preparedness-and-mitigation/fire-hazard-severity-zones. Accessed April 29, 2025.

the proposed Project are addressed in Sections 4.1 through 4.17 of this EIR. Implementation of the proposed Project would result in potentially significant impacts for the following topical issues:

- Air Quality
- Biological Resources
- Cultural Resources
- Geology and Soils
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Noise
- Tribal Cultural Resources

CEQA Guidelines Section 15126.2(c) requires EIRs to describe any significant impacts, including those that can be mitigated but not reduced to less than significant levels. The environmental effects of the proposed Project are addressed in Sections 4.1 through 4.17 of this EIR. Project implementation would result in potentially significant impacts for the following topical issues: air quality, biological resources, cultural resources, geology and soils, greenhouse gas (GHG) emissions, hazards and hazardous materials, noise, and tribal cultural resources. Project standard conditions (SCs) and mitigation measures (MMs) provided in Sections 4.1 through 4.17 would reduce these impacts to levels considered less than significant, except construction and operations-related greenhouse gas emissions impacts, which would remain significant and unavoidable as discussed below.

Greenhouse Gas Emissions. As discussed in **Section 4.7: Greenhouse Gas Emissions**, the Project is located within South Coast Air Quality Management District's (SCAQMD) jurisdiction. While SCAQMD has not adopted its proposed 3,000 metric tons of CO_2e ($MTCO_2e$) threshold, this EIR's analysis conservatively uses the proposed 3,000 $MTCO_2e$ screening threshold rather than the higher 10,000 $MTCO_2e$ industrial threshold. Project construction and operation would generate approximately 10,180 $MTCO_2e$ per year, and therefore exceed the 3,000 $MTCO_2e$ per year threshold despite implementing MM GHG-1 through MM GHG-4. As such, the Project would generate GHG emissions, either directly or indirectly, that would exceed SCAQMD thresholds despite all feasible mitigation measures, resulting in a significant and unavoidable impact.

5.3 SIGNIFICANT AND IRREVERSIBLE ENVIRONMENTAL CHANGES

CEQA Guidelines Section 15126.2(d) requires a discussion of any significant irreversible environmental changes that would be caused by a proposed project should it be implemented. Generally, the section notes that a project would result in significant irreversible environmental changes if the following occurs:

- The project would involve large amounts of nonrenewable resources during initial and continued phases in a way that would make their nonuse or removal unlikely;
- The primary and secondary impacts from the Project would generally commit future generations to similar uses;
- The project would involve uses in which irreversible damage could result from a potential environmental accident; and
- The proposed consumption of resources is not justified (e.g., the project involves the wasteful use of energy).

Project implementation would require long-term commitment of natural resources and land. Project development would result in committing land resources associated with warehouse uses. The Project includes infrastructure to support the proposed land use. Project construction and long-term operation would require committing and reducing available nonrenewable and slowly renewable resources,

including petroleum fuels and natural gas (for vehicle use, construction, lighting, heating, and cooling of structures) and lumber, sand/gravel, steel, copper, lead, and other metals (for use in building construction, piping, and roadway infrastructure). Other resources that are slow to renew and/or recover from environmental stressors would also be impacted by Project implementation; examples include air quality, through the combustion of fossil fuels and production of greenhouse gases and water supply, through the increased potable water demands for drinking, cleaning, landscaping, and general maintenance needs. The project does not propose land uses that are associated with such effects and would not include the use, storage, or disposal of materials that could damage the environment in the event of a release (i.e., refer to **Section 4.8: Hazards and Hazardous Materials**). With regard to the consumption of resources, as analyzed in **Section 4.5: Energy**, the project would not result in wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation.

5.4 GROWTH-INDUCING EFFECTS

CEQA Guidelines Section 15126.2(d) requires EIRs to include a discussion of ways in which a project could induce growth. The CEQA Guidelines identify a project as "growth-inducing" if it fosters economic or population growth or if it encourages the construction of additional housing either directly or indirectly in the surrounding environment. New employees from commercial or industrial development and new population from residential development represent direct forms of growth. These direct forms of growth have a secondary effect of expanding the size of local markets and inducing additional economic activity in the area. The proposed Project would therefore have a growth-inducing impact if it would:

- Directly or indirectly foster economic or population growth, or the construction of additional housing;
- Remove obstacles to population growth;
- Require the construction of new or expanded facilities that could cause significant environmental effects; or
- Encourage and facilitate other activities that could significantly affect the environment, either individually or cumulatively.

A project's potential to induce growth does not automatically result in growth. Growth can only happen through capital investment in new economic opportunities by the private or public sectors. Under CEQA, the potential for growth inducement is not considered necessarily detrimental nor necessarily beneficial, and neither is it automatically considered to be of little significance to the environment. The following analyzes the Project's potential growth-inducing impacts for the criteria outlined above, in accordance with CEQA Guidelines Section 15126.2(d). Potential growth-inducing effects are examined through analysis of the following questions.

5.4.1 Would the Project directly or Indirectly foster economic or population growth, or the construction of additional housing?

Population and Employment

According to the California Department of Finance (DOF), the City's estimated population in 2024 is 103,097 persons.[10] The California Employment Development Department (EDD) calculated the City's workforce in 2023 to be approximately 46,900 persons with 44,500 persons employed and 2,400 unemployed.[11] As discussed in **Section 4.13: Population and Housing**, the Project could generate approximately up to 557 employees, based on an employment generation factor of one employee per 1,195 sf of warehouse use.[12] The Project's estimated employment generation would be anticipated to draw from the local workforce. Further, a high percentage of City residents commute outside the City for employment.[13] Given the City's existing available local workforce, the Project would likely only have an indirect effect on the City's population through the expansion of economic activity within the City.

Housing

The project site is undeveloped, and the Project does not propose residential uses. Further, the Project is consistent with both the City's General Plan land use designation and zoning, and the impacts from future development have already been accounted for in the City's General Plan EIR. Therefore, given the City has already accounted for the Project's general economic and population effects, the Project would not directly affect housing availability within the City.

5.4.2 Would the Project remove obstacles to population growth or require the construction of new or expanded facilities that could cause significant environmental effects?

The Project would not remove obstacles to growth through the construction or extension of major infrastructure facilities. Although the project site is undeveloped, it is bordered by existing uses and is planned for development in the City's General Plan and the Rialto Airport Specific Plan.

As discussed in **Section 4.17: Utilities and Service Systems**, existing utilities and service systems (i.e., water, wastewater, solid waste, and electricity) are available to serve the Project. While upgrades to the existing utilities may be necessary, major infrastructure is already present in the area. Project improvements are distribution lines that would serve the project site via existing infrastructure such as the existing water and sewer mains in Lowell Street. The Project does not propose improvements that would extend services to areas that currently are not served or provide additional capacity in these infrastructure improvements, thereby facilitating new off-site development. There are no properties adjacent to the project site that would benefit by having the utilities extended. Therefore, the Project is

not considered growth inducing with respect to removal of obstacles to growth or through the provision of infrastructure.

5.4.3 Would the Project encourage and facilitate other activities that could significantly affect the environment, either individually or cumulatively?

The potential impacts associated with the Project have been analyzed in this EIR in Sections 4.1 through 4.17. Project mitigation measures and standard conditions would reduce identified potential significant environmental effects to less than significant except for greenhouse gas emissions. The Project's long-term operational unmitigated GHG emissions would exceed the 3,000 $MTCO_2e$ threshold. To reduce impacts associated with GHG emissions, the Project would implement Laws, Ordinances, and Regulations (LORs) GHG-1 through LOR GHG-7, MM AQ-2 through MM AQ-5, MM GHG-1 through MM GHG-4. However, Project GHG emissions would remain above the 3,000 $MTCO_2e$ threshold with the implementation of feasible mitigation. Project GHG impacts would remain significant and unavoidable. Project implementation is anticipated to have a beneficial economic effect. Project construction would create design, engineering, and construction-related jobs. These jobs would span from Project planning to construction, lasting until Project completion. This would be a direct but temporary growth-inducing Project impact.

5.5 MANDATORY FINDINGS OF SIGNIFICANCE

CEQA Guidelines Section 15065(a)(1)-(4) requires preparation of an EIR when certain specified impacts may result from construction or implementation of a project. An EIR determines a finding of significance if a project has the potential to: substantially degrade the quality of the environment; substantially reduce the habitat of a fish or wildlife species; cause a fish or wildlife population to drop below self-sustaining levels; threaten to eliminate a plant or animal community; substantially reduce the number or restrict the range of an endangered, rare or threatened species; or eliminate important examples of the major periods of California history or prehistory. In practice, this is the same standard as a significant effect on the environment, which is defined in Section 15382 of the CEQA Guidelines as "a substantial or potentially adverse change in any of the physical conditions within the area affected by the project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance."

An EIR has been prepared for the Project, which fully addresses all of the Mandatory Findings of Significance. This EIR in its entirety addresses and discloses all known potential environmental effects associated with the development of the Project including direct, indirect, and cumulative impacts in the following resource areas:

- Aesthetics
- Air Quality
- Biological Resources
- Cultural Resources
- Energy
- Geology and Soils
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Hydrology and Water Quality
- Land Use and Planning
- Mineral Resources
- Noise
- Population and Housing
- Public Services
- Transportation
- Tribal Cultural Resources
- Utilities and Services Systems

A summary of all potential environmental impacts, level of significance before and after the implementation of standard conditions and mitigation measures is provided in **Section 1.0: Executive Summary**. Endemic and endangered animals within California and the Project's potential effect on those species are discussed in **Section 4.3: Biological Resources**, of this EIR. The section found that although the project site has potential habitat to support burrowing owl, California horned lark, loggerhead shrike, prairie falcon, merlin, coastal whiptail, coast horned lizard, and Southern California legless lizard, Cooper's hawk, Costa's hummingbird, and Lawrence's goldfinch existing habitat on site has been disturbed by previous grading and is no longer suitable habitat for the species. Project implementation would have the potential to impact the above-mentioned species during construction activities. As such, the Project has included mitigation, as further discussed in the section. Crotch's bumble bee which is a candidate species for listing under the California Endangered Species Act (CESA) was observed on the project site. As described further in **Section 4.3: Biological Resource**, mitigation would be implemented which requires that an Incidental Take Permit (ITP) from the California Fish and Wildlife Service for the Crotch's bumble bee be obtained. One special-status plant species, Parry's spineflower was observed on the site. Parry's spineflower is a CRPR rank 1B.1 species, meaning it is rare, threatened, or endangered in California and elsewhere and eligible for state-listing under CEQA. Parry's spineflower is also a State Rank S2, meaning it is imperiled because of rarity making it very vulnerable to extirpation. Compensatory mitigation would be required to conserve, enhance, or restore Parry's spineflower habitat. Therefore, biological impacts can be mitigated to a less than significant level.

Section 4.4: Cultural Resources, of the EIR analyzed the potential historic and cultural resource impacts that could occur due to the implementation of the Project and found no recorded historic or prehistoric resources located within the project site. Mitigation proposed within the section would include the retainment of a professional archaeologist to further minimize potential effects to cultural resources. The mitigation presented in the section further lowered the significance of the potential impacts to less than significant levels.

6.0 ALTERNATIVES TO THE PROPOSED PROJECT

6.1 CEQA REQUIREMENTS FOR ALTERNATIVES IDENTIFICATION AND ANALYSIS

Under CEQA, the identification and analysis of alternatives to a project is a fundamental part of the environmental review process. Public Resources Code Section 21002.1(a) establishes the need to address alternatives in an EIR by stating that in addition to determining a project's significant environmental impacts and indicating potential means of mitigating or avoiding those impacts, "the purpose of an environmental impact report is ... to identify alternatives to the project."

Direction regarding the definition of project alternatives is provided in CEQA Guidelines Section 15126.6(a):

> *An EIR shall describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives.*

The CEQA Guidelines emphasize that the selection of project alternatives be based primarily on the ability to reduce impacts relative to a proposed project, "…even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly."[1] The CEQA Guidelines further direct that the range of alternatives be guided by a "rule of reason," such that only those alternatives necessary to permit a reasoned choice are addressed.[2]

> *Among the factors that may be taken into account when addressing the feasibility of alternatives are site suitability, economic viability, availability of infrastructure, general plan consistency, other plans or regulatory limitations, jurisdictional boundaries, and whether the proponent can reasonably acquire, control, or otherwise have access to the alternative site.*

Beyond these factors, the CEQA Guidelines require the analysis of a "no project" alternative and an evaluation of alternative location(s) for a project, if feasible. Based on the alternatives analysis, the City of Rialto (City) must identify an environmentally superior alternative. If the environmentally superior alternative is the no project alternative, then the EIR must identify an environmentally superior alternative among the other alternatives.[3] In addition, CEQA Guidelines Section 15126.6(c) requires that an EIR identify any alternatives that were considered for analysis but rejected as infeasible and discuss the reasons for their rejection.

6.2 PROJECT SUMMARY

As proposed, the Project would develop the approximately 40-acre site with a 664,859 square feet (sf) warehouse, inclusive of 7,713 sf of ancillary office space, 365 vehicle parking stalls, 398 trailer parking stalls, and a fence-secured dock area with 82 dock doors. The Project proposes three new driveways on Lowell Street, one driveway on Locust Avenue, and one emergency vehicle only driveway on Lake Padden Lane. The Project would be constructed using concrete tilt-up panels with architectural treatments for

[1] CEQA Guidelines § 15126.6(b).

[2] CEQA Guidelines § 15126.6(f).

[3] CEQA Guidelines § 15126.6(e)(2).

visual relief along the building facades. The warehouse would be white and grey with blue accents and blue window glazing. Views of the warehouse building would be shielded with a screen wall. The proposed Project is described in further detail in **Section 3.0: Project Description**.

The project site has a General Plan land use designation of General Industrial. The General Industrial designation allows for a broad range of heavy industrial activities requiring large areas of land with convenient access for trucks and rail.[4] The General Industrial designation permits manufacturing and distribution, as well as similar uses. The designation allows for a maximum Floor to Area Ratio (FAR) of 1.0. The proposed Project would have an approximate 0.38 FAR. The Project is consistent with the General Plan designation for the site.

The project site is within the Rialto Airport Specific Plan and has a Specific Plan land use designation of General Manufacturing (I-GM), which permits wholesale and warehousing operations. A Conditional Development Permit would be required for the development of a warehouse, which is a conditionally permitted use in industrial zones in the City.[5]

6.3 CRITERIA FOR SELECTING ALTERNATIVES

The range of feasible alternatives must be selected and discussed in a manner to foster meaningful public participation and informed decision making. Several criteria were used to select alternatives to the proposed Project. These criteria are described below.

Ability To Achieve Project Objectives

Section 15126.6(f) of the CEQA Guidelines states:

> *The range of alternatives required in an EIR is governed by a 'rule of reason' that requires the EIR to set forth only those alternatives necessary to permit a reasoned choice. The alternatives shall be limited to ones that would avoid or substantially lessen any of the significant effects of the project. Of those alternatives, the EIR need examine in detail only the ones that the lead agency determines could feasibly attain most of the basic objectives of the project.*

The CEQA Guidelines do not require an EIR to consider every plausible alternative to a project, but rather must examine in detail only the ones which the lead agency determines could feasibly attain most of the basic project objectives. For purposes of the alternative analysis, each alternative assessed in this EIR was evaluated to determine the extent to which it could attain the following objectives identified for the proposed Project:

Objective 1: Develop and operate a warehouse that is in close proximity to three major freeways (State Route 210, Interstate 215, and Interstate 15) to support the distribution of goods throughout the region and that also limits traffic truck disruption to residential areas within the City and neighboring jurisdictions.

Objective 2: Develop and operate a warehouse that maximizes the efficient use of a vacant and underutilized and environmentally constrained site near available infrastructure, to allow

[4] City of Rialto. 2010. *General Plan*. Page 2-10.

[5] City of Rialto. 1997. *Rialto Airport Specific Plan*. Table 8.

the City of Rialto to compete on a domestic and international scale through the efficient and cost-effective movement of goods.

Objective 3: Develop a warehouse in an appropriate location that is predominantly surrounded by other industrial uses and is consistent with the project site's General Manufacturing land use designation under the Rialto Airport Specific Plan.

Objective 4: Maximize the efficient movement of goods throughout the region by locating a warehouse development in close proximity to the Ports of Los Angeles and Long Beach.

Objective 5: Develop and operate an attractive warehouse development in the City of Rialto that meets industry standards for operational design criteria that will attract quality tenants and that will be competitive with other similar facilities in the region.

Objective 6: Positively contribute to the economy of the City of Rialto through new capital investment, expansion of the tax base and creation of new employment opportunities, including opportunities for highly trained workers.

Objective 7: Provide local employment for residents of the City to improve jobs-housing balance within the City, thereby reducing the need for members of the local workforce to commute outside the Project vicinity to work.

Objective 8: Provide infrastructure improvements including street and sidewalk improvements to Lowell Street and Locust Avenue, undergrounding of existing utilities, and drainage and water quality treatment improvements.

Objective 9: Develop a project that does not contribute to surface and groundwater quality degradation by treating surface and stormwater flows.

Elimination/Reduction of Significant Impacts

Section 15126.6(b) of the CEQA Guidelines states that "Because an EIR must identify ways to mitigate or avoid the significant effects that a project may have on the environment (Public Resources Code § 21002.1), the discussion of alternatives shall focus on alternatives to the project or its location which are capable of avoiding or substantially lessening any significant effects of the project, even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly."

Therefore, the alternatives evaluated in this EIR have been selected because they are anticipated to reduce and/or eliminate one or more significant impacts associated with the proposed Project. Potentially significant environmental impacts that would result from the Project are evaluated in Sections 4.1 through 4.17 of this EIR. With implementation of the respective Mitigation Program which could include existing requirements based on local, State, or federal regulations or laws and Mitigation Measures (MMs) identified for each topical issue, all significant impacts resulting from the Project would be reduced to a level considered less than significant with the exception of greenhouse gas (GHG) impacts. The Project's operational GHG emissions would exceed the 3,000 $MTCO_2e$ per year threshold, the majority due to non-construction related truck and passenger car trips. Despite all feasible mitigation implemented, including Mitigation Measure (MM) AQ-2 through MM AQ-5 and MM GHG-1 through MM GHG-4, project-related GHG emissions would remain significant and unavoidable.

Feasibility

Section 15126.6(f)(1) of the CEQA Guidelines states:

> *Among the factors that may be taken into account when addressing the feasibility of alternatives are site suitability, economic viability, availability of infrastructure, general plan consistency, other plans or regulatory limitations, jurisdictional boundaries (projects with a regionally significant impact should consider the regional context), and whether the proponent can reasonably acquire, control or otherwise have access to the alternative site (or the site is already owned by the proponent). No one of these factors establishes a fixed limit on the scope of reasonable alternatives (Citizens of Goleta Valley v. Board of Supervisors (1990) 52 Cal.3d 553; see Save Our Residential Environment v. City of West Hollywood (1992) 9 Cal.App.4th 1745, 1753, fn. 1).*

Each alternative was evaluated for its feasibility, its ability to attain the proposed Project's objectives, and its ability to reduce and/or eliminate significant impacts associated with the Project.

6.4 ALTERNATIVES CONSIDERED BUT REJECTED

Pursuant to CEQA Guidelines Section 15126.6(c), an EIR must briefly describe the rationale for selection and rejection of alternatives. The lead agency may make an initial determination as to which alternatives are potentially feasible and, therefore, merit in-depth consideration, and which are infeasible and need not be considered further. Alternatives that are remote or speculative, or the effects of which cannot be reasonably predicted, need not be considered (CEQA Guidelines § 15126.6(f), (f)(3)). This section identifies alternatives considered by the lead agency but rejected as infeasible and provides a brief explanation of the reasons for their exclusion. Alternatives may be eliminated from detailed consideration in the EIR if they fail to meet most of the project objectives, are infeasible, or do not avoid any significant environmental effects.

Alternative Project Location

Pursuant to CEQA Guidelines Section 15126.6(f)(2), alternate sites should be evaluated, if any feasible sites exist, where significant impacts can be lessened. An alternative location was considered and rejected as discussed below.

An alternative location was rejected from further consideration because the Project is consistent with the General Plan land use designation of General Industrial and the Specific Plan land use designation of I-GM for the project site and there are no site-specific significant and unavoidable impacts that would be lessened if a different site were selected. It is required under CEQA that alternative site(s) be evaluated if any feasible sites exist where significant impacts can be lessened. The Project would result in a significant and unavoidable GHG impact. Due to the cumulative nature of GHG emissions, the environmental impacts of development on any other site in the City are expected to be similar to those of the proposed Project. In addition, other sites, depending on their biological or cultural resources may have similar or greater impacts than the Project. Given the nature of the proposed Project, an alternative location would not alleviate the impacts because a relocation of the proposed Project would not lessen the significant and unavoidable GHG impact. Therefore, an alternative location may meet most of the basic Project objectives but would not substantially lessen impacts and meet the CEQA definition of an alternative. Therefore, this alternative was not further considered.

6.5 ALTERNATIVES FOR ANALYSIS

CEQA Guidelines Section 15126.6 (d) of the CEQA Guidelines requires an EIR to provide sufficient information about each alternative to allow for meaningful evaluation, analysis, and comparison with the Project. Pursuant to CEQA Guidelines Section 15126.6, an analysis of alternatives is presented in this EIR to provide decision-makers with alternatives to be considered. The CEQA Guidelines specify that an EIR shall describe a reasonable range of alternatives that would avoid or substantially lessen the Project's significant effects but need not consider every conceivable alternative.

The analysis provides a comparison of the alternatives' varying environmental effects and their merits and/or disadvantages in relation to the proposed Project and to each other; their feasibility and ability to achieve Project objectives are also discussed. The environmentally superior alternative is identified as required by CEQA see **Section 6.6: Environmentally Superior Alternative**.

Four alternatives to the proposed Project have been identified.

- Alternative 1: No Development Alternative
- Alternative 2: Truck Trailer Parking Alternative
- Alternative 3: Business Park Alternative
- Alternative 4: Reduced Warehouse Alternative

The four analyzed alternatives present a reasonable range of alternatives to the proposed Project. The analysis in this section focuses on significant and unavoidable impacts attributable to each alternative and the ability of each alternative to meet basic Project objectives. The evaluation of each alternative uses the same thresholds of significance identified in Sections 4.1 through 4.17.

For the alternatives, it is assumed that relevant regulatory requirements, applicable project design features, and project-specific mitigation measures identified for the proposed Project would also be implemented with each alternative and thus serve to reduce or avoid potential significant impacts similar to the proposed Project.

Alternative 1: No Development Alternative

CEQA Guidelines Section 15126.6, requires an evaluation of the "No Project" alternative for decision-makers to compare the impacts of approving a project with the impacts of not approving it. The No Development Alternative assumes that the proposed Project would not be developed, which means there would be no warehouse facilities, truck trailer parking, landscape improvements, or off-site roadway improvements. In its existing condition, the site would remain vacant and disturbed, and the remnants of a World War II-era bunker structure, rail spurs, and underground transformer would remain.

Section 15126.6(e)(2) of the CEQA Guidelines specifies the following:

> *The "no project" analysis shall discuss the existing conditions at the time the Notice of Preparation [NOP] is published, at the time environmental analysis is commenced, as well as what would be reasonably expected to occur in the foreseeable future if the project were not approved, based on current plans and consistent with available infrastructure and community services.*

Section 15126.6(e)(3)(B) of the CEQA Guidelines indicates that when the project is not a land use or regulatory plan, the "no project" alternative:

> *…is the circumstance under which the project does not proceed. Here the discussion would compare the environmental effects of the property remaining in its existing state against environmental effects which would occur if the project is approved. If disapproval of the project under consideration would result in predictable actions by others … this "no project" consequence should be discussed.*

Therefore, although this alternative assumes "No Development" (as required by CEQA), this is considered a speculative assumption as the land is assumed to remain in private ownership (as there are no offers to purchase the land for public use).

Alternative 1: Impact Comparison to the Proposed Project

Aesthetics. Under the Alternative 1 scenario, no development would occur, and the project site would remain vacant. There would be no buildings on site and no related on-site or off-site improvements would be provided. Because there are no scenic vistas proximate to the project site, neither the proposed Project nor Alternative 1 would adversely affect a scenic vista. Because no development on the project site would occur, regulations governing scenic quality are not applicable. However, it is noted that the proposed Project would be consistent with regulations governing scenic quality as addressed in the General Plan, Rialto Airport Specific Plan, and the Municipal Code. Because Alternative 1 would not involve development of the project site, there would be no new sources of lighting; the proposed Project would not result in significant lighting impacts. Neither the Project nor Alternative 1 would result in significant impacts regarding the topic of aesthetics.

Air Quality. Under the Alternative 1 scenario, because there would be no development, no air quality emissions would be generated. The proposed Project would generate emissions during construction and operational activities that require mitigation. Although Alternative 1 would not have any air quality impacts, all significant air quality impacts associated with the Project would be mitigated to a less than significant level.

Biological Resources. Alternative 1 would have no impacts to biological resources, including potential impacts to the burrowing owl and Crotch's bumble bee. Trees and other vegetation on the project site that currently could be used for nesting by migratory birds protected under the Migratory Bird Treaty Act (MBTA) would remain because no existing vegetation would be removed. Although Alternative 1 would not have any biological resources impacts, all potentially significant impacts associated with the Project would be mitigated to a less than significant level.

Cultural Resources. Under Alternative 1, the project site would remain in its current condition and would therefore prevent potential impacts to cultural resources. No construction or grading activities would occur. The intensive-level pedestrian survey conducted of the project site for this EIR found the entire site highly disturbed due to prior grading and development, with various instances of modern dumping and squatting observed. The field survey also confirmed the presence of resource CA-SBR-8696H at the project site, and noted the collapsing entry structure to the empty munitions bunker and historic debris. Although these resources have been determined not to be historically or archeologically significant, under this alternative the resources would remain in situ because the project site would not be developed. Therefore, the potential to discover and impact previously undisturbed cultural resources, including archaeological resources, would not occur. Although this Alternative 1 would have no impact on cultural resources, all potentially significant impacts associated with the Project would be mitigated to a less than significant level.

Energy. The energy usage during construction associated with water for dust control, diesel fuel consumption from on-road hauling trips and off-road construction diesel equipment, and gasoline consumption from on-road worker commute and vendor trips would not occur under the Alternative 1 scenario because no construction or development would occur. However, it is also noted that implementation of the proposed Project would not result in significant impacts concerning energy usage. Therefore, although Alternative 1 would have no impact on energy, the Project would result in a less than significant impact.

Geology and Soils. Under the Alternative 1 scenario, no development would occur on the project site. Therefore, the potential to expose additional people or structures to adverse effects of seismic ground shaking, ground failure, expansive soils, or other unstable geologic hazards would not occur. No soil erosion or loss of topsoil would occur since the project site would remain in its existing condition. Additionally, the potential to unearth unknown paleontological resources during Project implementation would not occur. Although Alternative 1 would have no impact on soils and geology or paleontological resources, impacts associated with the Project would be mitigated to a less than significant level.

Greenhouse Gas Emissions. Under Alternative 1, there would be no construction activities or associated construction equipment operations or operational activities. Therefore, there would be no short-term GHG emissions from construction activities or long-term GHG emissions from mobile sources, area sources, or the consumption of electricity, natural gas, and water associated with operations of the land uses assumed as a part of the Project. Alternative 1 would not generate additional GHG emissions and would have no impact, while the Proposed Project's GHG emissions would be significant and unavoidable despite implementation of all feasible mitigation.

Hazards and Hazardous Materials. Under the Alternative 1 scenario, no development would occur on the project site. The existing ammunitions bunker and brick and mortar structure, which were constructed in the 1940s, would not be demolished. The Phase II Environmental Site Assessment (ESA), which was prepared for the proposed Project, determined that there is the potential for the project site to contain unexploded ordinances (UXOs) and discarded military munitions (DMMs) due to the historical use of the site for munitions storage and the unknown suspected use of the site by historic adjacent pyrotechnic facilities. Although Alternative 1 would have no impact regarding hazards and hazardous materials, potential UXOs and DMMs would remain on the site.

Neither Alternative 1 nor the proposed Project would create a safety hazard as it pertains to an Airport Land Use Compatibility Plan because the project site is not located within two miles of a public airport or public use airport and would not emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school. Mitigation would be required such that Project demolition activities would not create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials during construction and would not result in the accidental release of hazardous materials. Therefore, although the proposed Project would require mitigation, potentially significant impacts would be mitigated to a less than significant level.

Hydrology and Water Quality. Alternative 1 assumes no development would occur on the project site. Because there would be no subsurface excavation, the potential to encounter groundwater would not occur. The existing on-site drainage pattern and runoff quantities would remain the same, and Alternative 1 would not affect groundwater supplies or interfere with groundwater recharge.

Under the proposed Project scenario, development would alter the site's existing drainage pattern because the site would change from a primarily undeveloped site to a developed site. However, the proposed drainage facilities would be sized to adequately treat runoff water from the project site, and the site does not include discharge to any streams or rivers. The proposed Project would be required to obtain a General Permit for Stormwater Discharge Associated with Construction Activity, prepare a Storm Water Quality Management Plan (SWQMP) and implement Best Management Practices (BMPs) to minimize on-site and off-site erosion and siltation. Therefore, Alternative 1 would have no impact on hydrology and water quality, whereas the proposed Project's impacts would be less than significant.

Land Use and Planning. Under Alternative 1, the project site would remain vacant. Neither Alternative 1 nor the Project would physically divide an established community through the introduction of physical or community barriers or cause a significant environmental impact due to a conflict with any plan, policy, or regulation adopted to avoid or mitigate an environmental effect. The Project would comply with Connect SoCal, the General Plan, Rialto Airport Specific Plan, and Rialto Municipal Code. Alternative 1 would have no impact on land use and planning because no development would occur, while the Project would result in a less than significant impact.

Mineral Resources. Under Alternative 1, the project site would remain vacant. The Department of Conservation's California Geological Survey maps (specifically, Special Report 206 Plate 2), the General Plan, and Rialto Airport Specific Plan do not identify the project site as an existing, planned, or potential mineral recovery site. Neither Alternative 1 nor the Project would result in the loss of in the availability of a known mineral resource or the loss of in the availability of a locally important mineral resource recovery site. Although Alternative 1 would result in no impacts to mineral resources, the Project would result in less than significant impacts regarding mineral resources.

Noise. Under Alternative 1, there would be no construction activities or associated construction equipment operations or development. Therefore, there would be no construction noise impacts. There would be no substantial temporary increase in noise levels or exposure of persons to or generation of noise levels in excess of standards. Therefore, Alternative 1 would avoid construction and operational noise impacts associated with the Project, whereas the Project's noise impacts would be mitigated to a less than significant level.

Population and Housing. Alternative 1 would not create any new jobs; involve the development of additional housing; or cause increases in the residential population of the City. Therefore, there would be no impact associated with inducing substantial population growth. This alternative would maintain the site in its existing condition. The proposed Project would not induce substantial unplanned population or displace any existing housing, and impacts would be less than significant. Alternative 1 would result in no impacts regarding population and housing whereas the Project would result in less than significant impacts.

Public Services. Alternative 1 would not involve new development, and therefore, no impacts to fire and police protection services would occur. Development of the proposed Project would incrementally increase the demand for fire and police protection services; however, the proposed Project is not expected to substantially increase service demand such that new or physically altered fire and police facilities would need to be constructed, which would cause significant environmental impacts in order to maintain acceptable service ratios, response times or other performance objectives for fire and police

protection. Therefore, Alternative 1 would have no impact, while the proposed Project would result in less than significant impacts on fire and police protection services.

Transportation. Under Alternative 1, the project site would remain vacant and would not generate any additional vehicle trips, compared to the 1,138 trips, including 455 truck trips, which would be generated by the Project. Passenger car equivalent (PCE) factors were then applied to the truck types, based on number of axles to determine the total PCE volumes generated by the project. Therefore, the proposed Project is estimated to generate 1,908 daily PCE trips. Alternative 1 would have no impact concerning vehicle miles traveled (VMT) while the proposed Project would have a less than significant impact concerning the Project's effect on VMT. While this alternative would have no transportation impacts, the proposed Project would have less than significant transportation impacts based on the City's CEQA significance criteria.

Tribal Cultural Resources. Alternative 1 would not involve any construction or excavation activities. Tribal cultural resource impacts are primarily dependent upon the construction and operations footprint of each development, as well as depth of excavation. Therefore, this alternative would have no impact on tribal cultural resources, whereas potential impacts associated with the proposed Project would be mitigated to a less than significant level.

Utilities and Service Systems. Alternative 1 would not involve the development of industrial land uses or the generation of any new employees; therefore, no impacts to utilities and service systems would occur. Since Alternative 1 would not provide new facilities or infrastructure, there would be no physical impacts associated with construction or operation of facilities or accelerated physical deterioration associated with increased usage of existing facilities. In addition, since there would be no development of industrial land uses or generation of new employees under Alternative 1, demand for water, wastewater facilities, dry utilities (electricity, natural gas, telecommunications), or solid waste disposal would not be required. The proposed Project would generate new employees, resulting in an incremental increase in the demand for water, wastewater, and dry utilities use, and the generation of solid waste. Therefore, Alternative 1 would result in no impacts to utilities and service systems while the proposed Project would result in a less than significant impact.

Feasibility and Ability to Meet Project Objectives

Alternative 1 fails to meet the Project's basic objectives. Alternative 1 would fail to develop and operate a warehouse that maximizes efficient use of a vacant and underutilized site that is near available infrastructure, major freeways, and other industrial developments. Additionally, this alternative would not provide infrastructure improvements including street and sidewalk improvements, undergrounding existing utilities, and drainage and water quality treatment improvements on Lowell Street and Locust Avenue. Finally, Alternative 1 would also fail to provide expanded economic activity to the City and would also not provide additional employment opportunities. This would conflict with the City's goals of expanding its economic base and providing greater economic opportunity to the City's residents.

Conclusion

Alternative 1 would have no significant impacts when compared to the proposed Project because no development would occur. Significant unavoidable GHG impacts associated with the proposed Project would not occur. No mitigation would be required to reduce potential significant impacts to a less than significant level. All impact areas which were anticipated to cause a less than significant impact, less than significant with mitigation measures, or a significant and unavoidable impact due to implementation of

the proposed Project would be eliminated under the No Project Alternative; see **Table 6-4: Summary of Proposed Project and Alternatives Impacts.** However, none of the Project objectives would be met.

Alternative 2: Truck Trailer Parking Alternative

Under the Truck Trailer Parking Alternative, the project site would be developed as an approximately 40-acre trailer truck and truck-mounted container storage parking facility. The project site has a Rialto Airport Specific Plan land use designation of I-GM, which permits land uses including wholesale and warehousing operations. Under this alternative scenario, no warehouse uses are assumed. Trucks and trailers would be parked while waiting to be moved to and from off-site locations such as nearby warehouse facilities in instances where there are scheduled delays related to trailer drop off or pick up. The Truck Trailer Parking Alternative would include a one-story, 1,500 sf ancillary free-standing small security office building, 15 passenger vehicle parking stalls for employees, and 960 truck trailer parking spaces.

Table 6-1: Alternative 2 and Proposed Project Comparison identifies a reduction of 663,359 sf of building area compared to the proposed Project.

Table 6-1: Alternative 2 and Proposed Project Comparison

Development Standard	Proposed Project	Alternative 2	Difference
Building Area (sf)	664,859	1,500	-663,359
Truck Trailer Parking	398	960	+562
Employee Parking	365	15	-350

Alternative 2: Impact Comparison to the Proposed Project

Aesthetics. Similar to the Project, Alternative 2 would comply with the development requirements of the Rialto Airport Specific Plan which are included in **Table 4.1-1: Development Standards Consistency Summary** in **Section 4.1: Aesthetics**, as well as General Plan and Municipal Code regulations governing scenic quality. As addressed in **Section 4.1: Aesthetics**, the project site is not proximate to a scenic vista; therefore, no impact would occur under either development scenario. Both Alternative 2 and the proposed Project would comply with applicable light and glare regulations, such as General Plan Policy 2-14.3, which requires the use of building materials that do not produce glare. Further, similar to the Project, Alternative 2 would provide lighting in the surface parking areas; light would also be generated from trucks and passenger vehicle headlights when accessing and leaving the project site. There are no sensitive receptors adjacent to the project site and Locust Avenue is a designated truck route. Therefore, no significant light and glare impacts would be associated with Alternative 2 or the proposed Project. Neither Alternative 2 nor the proposed Project would result in significant visual impacts. Potential impacts associated with the topic of Aesthetics would be less than significant for both the proposed Project and Alternative 2.

Air Quality. Alternative 2 would construct a much smaller building but a larger surface parking area than the proposed Project. This alternative assumes a shorter construction schedule, a less intensive site preparation and grading phase of construction, and the use of less construction materials and equipment. Accordingly, the maximum daily emissions would be lower than the proposed Project. Therefore, Alternative 2 would result in less construction emission impacts than the proposed Project.

Mobile source emissions associated with Alternative 2 would increase, as Alternative 2 would result in more truck trips per day than the proposed Project. This increase in truck trips would result in greater

mobile emissions. However, Alternative 2 would also reduce stationary emission sources from mechanical equipment (e.g., HVAC units) as the facility for Alternative 2 is 663,359 sf smaller than the proposed Project. Potential impacts to air quality would remain less than significant with mitigation incorporated.

Biological Resources. Biological resources are primarily dependent upon the construction and operations footprint of each development. Like the proposed Project, Alternative 2 assumes that the entire project site would be graded. Therefore, for environmental issues where project site disturbance would be the same for the Project and Alternative 2, there would be no change in the significance of potential impacts to biological resources. Therefore, as with the Project, Alternative 2 would result in a less than significant impact with mitigation incorporated in regard to biological resources.

Cultural Resources. Cultural resources are primarily dependent upon the construction and operations footprint of each development. Like the proposed Project, Alternative 2 assumes that the entire project site would be graded. Therefore, for environmental issues where project site disturbance would be the same for Alternative 2 and the proposed Project and Alternative 2, there would be no change in the significance of potential impacts for cultural resources. Therefore, as with the Project, this alternative would result in a less than significant impact with mitigation incorporated.

Energy. Construction of Alternative 2 would likely result in a shorter construction schedule, a less intensive site preparation and grading phase of construction, and the use of less construction materials and equipment. Therefore, the energy usage during construction associated with water usage for dust control, diesel fuel consumption from on-road hauling trips and off-road construction diesel equipment, and gasoline consumption from on-road worker commute and vendor trips would less than or similar to the proposed Project. With respect to operational uses, Alternative 2 would result in a decrease in energy usage given this alternative would result in a decrease of building development. Energy usage resulting from Alternative 2 would be proportionally reduced as compared to the proposed Project. Energy impacts would be less than significant.

Geology and Soils. Potential geological, soil, and paleontological resource impacts of Alternative 2 would be similar to the Project because it would be developed within the same footprint and under the same geologic unit and soil conditions. The potential for seismic ground shaking, fault rupture, liquefaction, or collapse would be the same or similar. Development under this alternative would also be required to comply with California Building Code standards and applicable construction and operational BMPs to reduce impacts related to geologic hazards. Additionally, the potential to unearth unknown paleontological resources during Project implementation could occur. Impacts associated with Alternative 2 and the Project would be reduced to a less than significant impact with mitigation incorporated.

Greenhouse Gas Emissions. Alternative 2 assumes the construction of a smaller facility but larger surface parking area than the proposed Project. A shorter construction schedule, a less intensive site preparation and grading phase of construction, and the use of less construction materials and equipment is anticipated. Accordingly, direct emissions of GHGs from construction activities would be lower than the Project. Once construction is complete, the generation of these construction-related GHG emissions would cease. The SCAQMD recommends that construction emissions be amortized over a 30-year project lifetime. Therefore, projected GHGs from construction are quantified and amortized over 30 years. The amortized construction emissions are added to the annual average operational emissions.

Alternative 2 would result in a decrease in operational GHG emissions from area sources, given that this alternative would result in a decrease of 663,359 sf of development. However, the average daily trips

associated with Alternative 2 would increase and result in greater GHG emissions from mobile sources compared to the Project. As the majority of the GHG emissions (approximately 77%) from the proposed Project are associated with mobile sources, Alternative 2 would likely result in greater overall GHG emissions. Both the Project and Alternative 2 would implement MM AQ-2 through MM AQ-5 and MM GHG-1 through MM GHG-4 to reduce operational emissions. Despite implementation of mitigation, both Alternative 2 and the proposed Project would result in significant and unavoidable GHG emission impacts.

Hazards and Hazardous Materials. Impacts related to hazards and hazardous materials for Alternative 2 would be similar to the Project because it would be developed within the same footprint. Alternative 2 would still include the demolition of an ammunition bunker and brick and mortar structure and there is still the potential for the project site to contain UXOs or DMMs due to the historical use of the site. MMs HAZ-1 through MM HAZ-4 would also be applicable to Alternative 2 to reduce potential impacts associated with asbestos, lead-based paint, the potential for UXOs and DMMs, and soil contamination to a less than significant level. Like the proposed Project, Alternative 2 would not expose persons on the project site to airport hazards, affect aircraft operations, or create an airport safety hazard for on-site employees. Additionally, there are no schools within 0.25-mile of the project site. Alternative 2 would include the operation of a truck trailer parking facility and would not result in the release of hazardous materials. Impacts associated with Alternative 2 and the proposed Project would be less than significant with mitigation incorporated.

Hydrology and Water Quality. The development footprint for Alternative 2 and the Project would be the same. Therefore, under both development scenarios, the amount of pervious surface would decrease associated with buildings and parking. Alternative 2 would still be required to obtain a General Permit for Stormwater Discharge Associated with Construction Activity and prepare a SWQMP, which must include erosion-control and sediment control BMPs that would meet or exceed measures required by the Construction General Permit to control potential construction-related pollutants. The Project's operator would also be required to prepare a water quality management plan pursuant to the City's Municipal Code Section 12.60.260. With respect to hydrology and water quality, impacts associated with Alternative 2 and the proposed Project would be less than significant with Standard Conditions incorporated.

Land Use and Planning. As with the proposed Project, the Alternative 2 development scenario would not physically divide an established community through the introduction of either physical or community barriers and would not cause a significant environmental impact due to a conflict with any plan, policy, or regulation adopted to avoid or mitigate an environmental effect. Alternative 2 would comply with the existing land use designations requirements applicable to the site, including the Rialto Airport Specific Plan, General Plan, and Municipal Code. Further, both Alternative 2 and the proposed Project would be consistent SCAG 2020-2024 Regional Transportation Plan/Sustainable Communities Strategy (Connect SoCal). Additionally, neither scenario would introduce any roadways or infrastructure that would bisect or transect surrounding land uses. Therefore, both Alternative 2 and the Project would have a less than significant impact associated with land use and planning.

Mineral Resources. Potential mineral resources impacts would be the same as the Project because it would be developed within the same footprint. The Department of Conservation's California Geological Survey maps (specifically, Special Report 206 Plate 2), the General Plan, and Rialto Airport Specific Plan do not identify the project site as an existing, planned, or potential mineral recovery site. As with the proposed Project, Alternative 2 would be consistent with the existing land use designations of the project

site. Neither Alternative 2 or the proposed Project would result in the loss of availability of a significant mineral resource and impacts would be less than significant.

Noise. Under the Alternative 2 scenario, there would be fewer construction activities because the Alternative would require construction of a much smaller facility than the proposed Project and surface parking construction would be less time-intensive than construction of a warehouse. Therefore, Alternative 2 would result in lower construction noise impacts. However, construction of Alternative 2 would still require implementation of MM NOI-1 which requires the proper maintenance of construction equipment and the installation of noise shielding/muffling devices to mitigate construction noise impacts. Therefore, in regard to construction noise, impacts associated with Alternative 2 and the proposed Project would both be less than significant with mitigation incorporated.

Under Alternative 2, operational noise impacts would be similar to or greater than the proposed Project. Alternative 2 would generate less noise from mechanical equipment due to the reduction of 663,359 sf of building development. However, there would be more noise from trucks including parking, back-up alarms, and off-site traffic noise due to the increase in daily traffic trips. Therefore, when compared to the proposed Project, Alternative 2 would have greater noise impacts. It is anticipated that operational noise impacts associated with Alternative 2 and the proposed Project would both be less than significant.

Population and Housing. Both Alternative 2 and the proposed Project would generate new construction and permanent employment opportunities. The Project proposes a warehouse building and would employ approximately 557 employees. Alternative 2 would involve the development and operation of a truck trailer parking facility, which would have fewer employment opportunities than the proposed Project. Similar to the Project, future employees are anticipated to travel to and from the site from within the City and surrounding area. Neither Alternative 2 nor the Project would require the construction of additional residential units that could induce substantial unplanned population growth not analyzed in the City's General Plan. Therefore, Alternative 2 would reduce the number of employees required for operations when compared to the proposed Project. Under both development scenarios, impacts to population and housing would be less than significant.

Public Services. Development under both Alternative 2 and the Project would incrementally increase the demand for police and fire protection services. However, Alternative 2 would reduce the number of employees required for on-site operations, which would incrementally reduce the demand on public services when compared to the proposed Project. Neither scenario is expected to substantially increase service demand such that a new or physically altered facility would need to be constructed, which would cause significant environmental impacts, to maintain acceptable service ratios, response times or other performance objectives for police and fire protection. Further, development impact fees are paid on a project-by-project basis to ensure a proportionate fair share is contributed toward facilities, equipment, and personnel that would be needed over time to accommodate the additional demand from a project. Alternative 2 would incrementally reduce the demand of public services when compared to the proposed Project. Under both development scenarios, impacts would be less than significant.

Transportation. Based on the trip generation assumptions established by the City, Alternative 2 is expected to result in an increase in average daily trips, compared to the Project. Therefore, Alternative 2 would likely result in greater VMT and transportation impacts than the proposed Project. The proposed Project would generate 1,138 trips, including 455 truck trips. The VMT impacts are measured based on the Citywide VMT per Service Population Threshold and the Countywide VMT per Employee Threshold

and would result in less than significant impacts concerning VMT. However, based on the City's significance criteria, it is anticipated that under both scenarios, impacts would be less than significant.

Tribal Cultural Resources. Tribal cultural resources are primarily dependent upon the construction and operations footprint of each development. Like the Project, Alternative 2 assumes that the entire project site would be graded. Therefore, for environmental issues where site disturbance would be the same for the Project and Alternative 2, there would be no change in the significance of potential impacts for tribal cultural resources. Therefore, as with the proposed Project, this alternative would result in a less than significant impact to tribal cultural resources with mitigation incorporated.

Utilities and Service Systems. When compared to the Project, the reduced square footage and number of employees associated with Alternative 2 would result in a decrease in demand on utilities, as the Alternative would result in a decrease of 663,359 sf of development. A Water Supply Assessment was prepared for the proposed Project, which concluded that the Project would not significantly impact water supply. Therefore, because Alternative 2 would only include a 1,500-sf building, the water and wastewater demand compared to the Project would be substantially lower during construction and operations. A smaller building would also result in a lower demand for electrical power and telecommunications infrastructure; the parking area would have a slightly higher demand for electricity than the parking area associated with the proposed Project; no natural gas use is assumed. Alternative 2 would result in lower solid waste generation than the Project; neither Alternative 2 nor the proposed Project would significantly impact the permitted capacity of the Mid-Valley Sanitary Landfill. Alternative 2 would incrementally reduce the demand of utilities and service systems when compared to the proposed Project. Under both development scenarios, impacts would be less than significant.

Feasibility and Ability to Meet Project Objectives

Alternative 2 fails to meet the proposed Project's Objectives 1 through 5. Alternative 2 would fail to develop and operate a warehouse that maximizes efficient use of a vacant and underutilized site that is near available infrastructure, major freeways, and other industrial developments. Alternative 2 does not reflect the type of development proposed by the Applicant. However, this alternative would provide infrastructure improvements including street and sidewalk improvements, undergrounding of existing utilities, and drainage and water quality treatment improvements on Lowell Street and Locust Avenue. Additionally, Alternative 2 would provide expanded economic activity and additional employment opportunities to the City, but to a lesser degree than the proposed Project. Alternative 2 would not conflict with the City's goals of expanding its economic base and providing greater economic opportunity to the City's residents.

Conclusion

Alternative 2 would have a building area of approximately 1,500 sf, which is a decrease of 663,359 sf when compared to the Project but would increase the number of truck trailer parking spaces. Uses of Alternative 2 would be consistent with the Specific Plan and impacts would be similar to that of the Project (see **Table 6-4**).

Like the Project, this alternative assumes that the entire project site would be graded. Therefore, for environmental issues where project site disturbance would be the same for the Project and Alternative 2, there would be no change in the significance of the potential impacts. This would be the case for the topics of biological resources, cultural resources, geology and soils, hazards and hazardous materials, and tribal cultural resources, which would be mitigated to a less than significant level. Similarly, this would

also be the case for hydrology and water quality and mineral resources, which would be less than significant.

Neither Alternative 2 nor the Project would result in significant aesthetic impacts. Although the building square footage associated with Alternative 2 would decrease, the remaining project site area would be developed with truck trailer parking and site landscaping. With respect to traffic, Alternative 2 is expected to result in an increase in average daily trips compared to the Project. Alternative 2 would likely result in greater VMT impacts than the proposed Project.

Alternative 2 assumes the construction of facility that is 663,359 sf smaller than the proposed Project. Therefore, a shorter construction schedule, a less intensive site preparation and grading phase of construction, and the use of less construction materials and equipment is anticipated. Accordingly, construction air quality emissions, GHG emissions, energy usage and noise levels would be lower than the proposed Project. However, the increase in average daily trips associated with Alternative 2 would likely result in greater operational air quality emissions, energy usage, GHG emissions, and noise impacts. As with the proposed Project, energy usage impacts would be less than significant, air quality emissions and noise impacts would still be less than significant with mitigation incorporated, and GHG emission impacts would be significant and unavoidable despite implementation of mitigation.

Alternative 2 would fail to develop and operate a warehouse that maximizes efficient use of a vacant and underutilized site that is near available infrastructure, major freeways, and other industrial developments as set forth in Project Objectives 1 through 5. Alternative 2 would provide infrastructure improvements and would provide expanded economic activity to the City and would also provide additional employment opportunities. This alternative would still contribute to the City's goal of positively contributing to the economy through new capital investment, expansion of the tax base, and creation of new employment opportunities but to a lesser degree than the proposed Project.

Alternative 3: Business Park Alternative

Under the Business Park Alternative, the project site would be developed as a 667,000-sf business park. Alternative 3 would develop multi-tenant, free-standing small buildings with office/commercial-related uses. The Business Park Alternative would accommodate a variety of uses including commercial, flexible office space, meeting rooms, or event space. The buildings would be one story and building height would be consistent with development standards included in the Rialto Airport Specific Plan. Under the Business Park Alternative scenario, no warehouse uses are assumed. Therefore, no truck trailer parking would be provided, and individual buildings would not have dock doors for large trucks. All employee and visitor parking would be provided on the project site, this alternative assumes 2,224 passenger vehicle parking stalls for employees. The parking requirements for the Airport Specific Plan are based on the Municipal Code and would be calculated for administrative/office uses. **Table 6-2: Alternative 3 and Proposed Project Comparison**, identifies an increase of 1,859 passenger vehicle parking spaces and a reduction of 398 truck trailer parking spaces when compared to the proposed Project.

Table 6-2: Alternative 3 and Proposed Project Comparison

Development Standard	Proposed Project	Alternative 3	Difference
Building Area (sf)	664,859	667,000	+2,141
Truck Trailer Parking	398	0	-398
Employee Parking	365	2,224	+1,859

The project site has a General Plan land use designation of General Industrial and has a Rialto Airport Specific Plan land use designation of I-GM. Under this alternative scenario, a General Plan Amendment to Business Park would be required. Table 8 of the Rialto Airport Specific Plan identifies permitted uses within the I-GM land use designation including manufacturing and processing, warehousing and distribution, chemical or petroleum products processing and refining, heavy equipment operations, and similar uses.[6] A business park is not a permitted use or a conditionally permitted use in the I-GM land use designation. Business and commercial uses are permitted under several Specific Plan land use designations including Office/Freeway Commercial (O/FC), Airport-Related Planned Industrial Development (I-AR). Therefore, Alternative 3 would require additional discretionary permits/approvals including a Specific Plan Amendment to allow for the development of a business park on the project site.

Alternative 3: Impact Comparison to the Proposed Project

Aesthetics. Because there are no scenic vistas proximate to the project site, neither Alternative 3 nor the proposed Project would adversely affect a scenic vista. Similar to the Project, Alternative 3 would be required to be consistent with the development standards of the Rialto Airport Specific Plan, as well as the General Plan and Municipal Code. Both the proposed Project and Alternative 3 would comply with applicable light and glare regulations, such as General Plan Policy 2-14.3, which requires the use of building materials that do not produce glare. Further, Alternative 3 and the proposed Project assume roughly the same building square footage. Alternative 3 would be consistent with the visual quality of adjacent industrial, warehouse, and office land uses. Alternative 3 would include surface parking and landscaping, similar to the Project. Therefore, both Alternative 3 and the proposed Project would result in less than significant impacts associated with aesthetics.

Air Quality. While the square footage of both Alternative 3 and the proposed Project would be almost the same, Alternative 3 assumes multiple buildings and office uses would require more internal building improvements than a warehouse facility. Therefore, a longer construction schedule, a similar site preparation and grading phase of construction, and the use of more construction materials and equipment is anticipated. Accordingly, maximum daily construction emissions would likely be greater than the proposed Project.

Alternative 3 would generate 8,297 daily trips when compared to the 1,138 daily trips, including 455 truck trips (1,908 daily PCE trips) for the proposed Project. Therefore, Alternative 3 would result in a substantial increase in average daily trips, and thus a proportional increase in mobile source emissions when compared to the Project. Although this alternative would result in less truck traffic, the number of passenger vehicles would increase. Additionally, Alternative 3 would not significantly reduce stationary emission sources from mechanical equipment (e.g., HVAC units) and landscaping equipment for project site maintenance. Alternative 3 would still require implementation of MM AQ-1 through MM AQ-5 to mitigate air quality impacts to a less than significant level. Air quality emissions would be proportionally greater than the proposed Project due to the increased average daily trips associated with Alternative 3.

Biological Resources. Like the Project, Alternative 3 assumes that the entire project site would be graded. Therefore, for environmental issues where site disturbance would be the same for the Project and Alternative 3, there would be no change in the significance of potential impacts. Therefore, as with the

[6] City of Rialto. 1997. *Rialto Airport Specific Plan*. Table 8.

proposed Project, impacts to biological resources associated with Alternative 3 would also be less than significant with mitigation.

Cultural Resources. Like the Project, Alternative 3 assumes that the entire project site would be graded. Therefore, for environmental issues where site disturbance would be the same for the proposed Project and Alternative 3, there would be no change in the significance of potential impacts. Therefore, as with the Project, impacts to cultural resources associated with Alternative 3 would also be less than significant with mitigation.

Energy. Alternative 3 would require more construction than the proposed Project because multiple buildings would be constructed. Therefore, energy usage during construction associated with water usage for dust control, diesel fuel consumption from on-road hauling trips and off-road construction diesel equipment, and gasoline consumption from on-road worker commute and vendor trips would be greater than the Project due to the longer construction schedule, and the use of more construction materials and equipment. Additionally, Alternative 3 would result in an increase in operational energy usage based on the nature of the land uses assumed under this alternative scenario. However, potential energy impacts would remain less than significant.

Geology and Soils. Potential geological, soil, and paleontological resource impacts for Alternative 3 would be similar to the Project because it would be developed within the same footprint and under the same geologic unit and soil conditions. The potential for seismic ground shaking, fault rupture, liquefaction, or collapse would be the same as with the proposed Project. Development under Alternative 3 would also be required to submit a site-specific geotechnical investigation, comply with California Building Code standards, and applicable construction and operational BMPs to reduce impacts related to geologic hazards. Impacts associated with Alternative 3 and the Project would be less than significant with mitigation incorporated.

Greenhouse Gas Emissions. Because the construction of multiple buildings is assumed, a longer construction schedule and the use of more construction materials and equipment is anticipated. Accordingly, direct emissions of GHGs from construction activities would be greater than the proposed Project. Additionally, Alternative 3 would result in an increase in average daily trips compared to the proposed Project. Alternative 3 would generate 8,297 daily trips when compared to the 1,138 daily trips, including 455 truck trips (1,908 daily PCE trips) for the proposed Project. As such, Alternative 3 would result in greater GHG emissions compared to the Project during operations. Both the Project and Alternative 3 would implement MM GHG-1 through MM GHG-4 to reduce operational emissions. Despite implementation of mitigation, Alternative 3 and the proposed Project would result in significant and unavoidable impacts regarding GHG emissions. However, GHG emissions under Alternative 3 would be proportionally greater than the proposed Project due to the increased average daily trips.

Hazards and Hazardous Materials. Impacts related to hazards and hazardous materials for Alternative 3 would be similar to the Project because it would be developed within the same footprint. Alternative 3 would still include the demolition of an ammunition bunker and brick and mortar structure and there is still the potential for the project site to contain UXOs or DMMs due to the historical use of the site. MMs HAZ-1 through MM HAZ-4 would also be applicable to Alternative 3 to reduce potential impacts associated with asbestos, lead-based paint, the potential for UXOs and DMMs, and soil contamination to a less than significant level. Like the Project, Alternative 3 would not expose persons on the project site to airport hazards, affect aircraft operations, or create an airport safety hazard for employees. Alternative 3 would

consist of the operation of a commercial office park and would not result in the release of hazardous materials. Additionally, there are no schools within 0.25-mile of the project site. Impacts associated with Alternative 3 and the proposed Project would be less than significant with mitigation incorporated.

Hydrology and Water Quality. The development footprint for Alternative 3 and the Project would be roughly the same. Therefore, under both development scenarios, the amount of pervious surface would decrease associated with buildings and parking. Alternative 3 would still be required to obtain a General Permit for Stormwater Discharge Associated with Construction Activity and prepare a SWQMP, which must include erosion-control and sediment control BMPs that would meet or exceed measures required by the Construction General Permit to control potential construction-related pollutants. The Project's operator would also be required to prepare a water quality management plan pursuant to the City's Municipal Code Section 12.60.260. With respect to hydrology and water quality, impacts associated with Alternative 3 and the proposed Project would be less than significant with Standard Conditions incorporated.

Land Use and Planning. Development of Alternative 3 would require a General Plan Amendment and Specific Plan Amendment. The project site has a Rialto Airport Specific Plan land use designation of I-GM. Under this alternative scenario, a General Plan Amendment from General Industrial to Business Park would be required. It is also noted that a business park is not a permitted use or a conditionally permitted use in the I-GM land use designation; thus, Alternative 3 would require discretionary permits/approvals including a Specific Plan Amendment to allow for the development of a business park on the project site. Alternative 3 would be required to be consistent with the Rialto Airport Specific Plan, General Plan, and Municipal Code. Both Alternative 2 and the proposed Project would be consistent with Connect SoCal.

Like the proposed Project, Alternative 3 would not physically divide an established community through the introduction of either physical or community barriers and would not cause a significant environmental impact due to a conflict with any plan, policy, or regulation adopted to avoid or mitigate an environmental effect. Additionally, neither scenario would introduce any roadways or infrastructure that would bisect or transect surrounding land uses.

Alternative 3 would result in greater impacts to land use and planning because it would require discretionary permits/approvals including a General Plan Amendment and Specific Plan Amendment to allow for the development of a business park on the project site. Impacts to land use and planning would be less than significant under both scenarios.

Mineral Resources. Potential mineral resource impacts for Alternative 3 would be similar to the Project because it would be developed within roughly the same footprint. The Department of Conservation's California Geological Survey maps (specifically, Special Report 206 Plate 2), the General Plan, and Rialto Airport Specific Plan do not identify the project site as an existing, planned, or potential mineral recovery site. Neither Alternative 2 nor the proposed Project would result in the loss of availability of a significant mineral resource and impacts would remain less than significant.

Noise. Under the Alternative 3 scenario, there would be slightly more construction activities because the alternative would require construction of multiple buildings. Therefore, Alternative 3 would result in longer duration of construction noise. Construction of Alternative 3 would still require implementation of MM NOI-1 which requires the proper maintenance of construction equipment and the installation of noise shielding/muffling devices to mitigate construction noise impacts.

Although Alternative 3 would have less truck traffic, the number of passenger vehicles would increase by 1,859 stalls compared to the Project. Alternative 3 would generate 8,297 daily trips when compared to the 1,138 daily trips, including 455 truck trips (1,908 daily PCE trips) for the proposed Project. Therefore, Alternative 3 would result in an increase in average daily trips, and thus, an increase in vehicle traffic volumes on nearby roadways. Therefore, when compared to the proposed Project, Alternative 3 would have incrementally greater noise impacts. However, it is anticipated that operational noise impacts associated with Alternative 3 and the proposed Project would both be less than significant.

Population and Housing. Both Alternative 3 and the proposed Project would generate new construction and permanent employment opportunities. The Project proposes a warehouse building and would employ approximately 557 employees. Alternative 3 would involve the development of a commercial business park, which would have greater employment opportunities. Similar to the Project, future employees are anticipated to travel to and from the site from within the City and surrounding area. Neither Alternative 3 nor the Project would require the construction of additional residential units that could induce substantial unplanned population growth not analyzed in the City's General Plan. Therefore, Alternative 3 would increase the number of employees required for operations when compared to the proposed Project. Under both development scenarios, impacts to population and housing would be less than significant.

Public Services. Development of both Alternative 3 and the Project would incrementally increase the demand for police and fire protection services. However, Alternative 3 would increase the number of employees required for operations, which would incrementally increase the demand on these services when compared to the proposed Project. Neither scenario is expected to substantially increase service demand such that a new or physically altered facility would need to be constructed, which would cause significant environmental impacts, to maintain acceptable service ratios, response times or other performance objectives for police and fire protection. Further, development impact fees are paid on a project-by-project basis to ensure a proportionate fair share is contributed toward facilities, equipment, and personnel that would be needed over time to accommodate the additional demand from a project. Alternative 3 would incrementally increase the demand of fire and police protection services when compared to the proposed Project. Under both development scenarios, impacts would be less than significant.

Transportation. Alternative 3 would generate 8,297 daily trips. The VMT impacts are measured based on the Citywide VMT per Service Population Threshold and the Countywide VMT per Employee Threshold. The Project would generate 1,138 trips, including 455 truck trips (or 1,908 daily PCE trips), and would result in a less than significant impact concerning VMT. Alternative 3 is expected to result in an increase in average daily trips, compared to the Project. Therefore, Alternative 3 would likely result in greater VMT and transportation impacts than the proposed Project. Under both scenarios, impacts would be less than significant.

Tribal Cultural Resources. Like the Project, Alternative 3 assumes that the entire project site would be graded. Therefore, for environmental issues where site disturbance would be the same for the proposed Project and Alternative 3, there would be no change in the significance of potential impacts. Therefore, as with the Project, impacts to tribal cultural resources associated with Alternative 3 would also be less than significant with mitigation incorporated.

Utilities and Service Systems. When compared to the Project, Alternative 3 would result in an increase in demand on utilities because of the nature of office and commercial uses compared to a warehouse. A Water Supply Assessment would be required and is assumed that this alternative scenario would require increased water and wastewater demand compared to the Project during construction and operations. The uses would also result in an increased demand for electrical power, natural gas, and telecommunication services. While Alternative 3 may result in greater solid waste generation than the Project, no significant impact is assumed because the landfill has a permitted daily capacity to accommodate development under this alternative scenario. Alternative 3 would increase the demand on utilities and service systems when compared to the proposed Project. Under both development scenarios, impacts would be less than significant.

Feasibility and Ability to Meet Project Objectives

Alternative 3 fails to meet most of the Project's basic objectives because Alternative 3 does not propose a warehouse, which is the Applicant's proposed use for the project site. Development of the site as a business park would require a General Plan Amendment and Specific Plan Amendment. However, Alternative 3 would provide expanded economic activity to the City and would also provide additional employment opportunities. This alternative would also provide infrastructure improvements including street and sidewalk improvements, undergrounding of existing utilities, and drainage and water quality treatment improvements on Lowell Street and Locust Avenue. Alternative 3 would also not conflict with the City's goals of expanding its economic base and providing greater economic opportunity to the City's residents.

Conclusion

A business park is not a permitted use or a conditionally permitted use under the General Plan and Specific Plan land use designation for the project site. Therefore, Alternative 3 would require additional discretionary permits/approvals to allow for the development of a business park on the project site.

Like the Project, this alternative assumes that the entire project site would be graded and developed within the same footprint. Therefore, for environmental issues where project site disturbance would be the same for the Project and Alternative 3, there would be no change in the significance of potential impacts. This would be the case for the topics of biological resources, cultural resources, geology and soils, hazards and hazardous materials, and tribal cultural resources which would be mitigated to a less than significant level. Similarly, this would also be the case for hydrology and water quality and mineral resources, which would be less than significant.

Neither Alternative 3 nor the Project would result in significant aesthetic impacts. With respect to traffic, Alternative 3 is expected to result in an increase in average daily trips, compared to the Project. Alternative 3 would generate 8,297 daily trips compared to the 1,138 daily trips, including 455 truck trips (1,908 daily PCE trips) for the proposed Project. Alternative 3 would likely result in greater VMT impacts than the proposed Project, although both would result in less than significant impacts.

Alternative 3 would require the construction of multiple buildings when compared to one larger warehouse building. Therefore, a longer construction schedule and the use of more construction materials and equipment is anticipated. Accordingly, construction air quality emissions, energy usage, GHG emissions, and noise impacts would be incrementally greater than the proposed Project. Additionally, the increase in average daily trips associated with Alternative 3 is also likely to worsen operational impacts related to air quality emissions, energy usage, GHG emissions, and noise impacts. As with the proposed

Project, energy usage impacts would be less than significant, air quality emissions and noise impacts would still be less than significant with mitigation incorporated, and GHG emission impacts would be significant and unavoidable despite implementation of mitigation.

Alternative 3 would fail to develop and operate a warehouse that maximizes efficient use of a vacant and underutilized site that is zoned for industrial uses and that is near available infrastructure, major freeways, and other industrial developments. However, Alternative 3 would provide infrastructure improvements and would provide expanded economic activity to the City and would also provide additional employment opportunities. This alternative would still contribute to the City's goal of positively contributing to the economy through new capital investment, expansion of the tax base and creation of new employment opportunities.

Alternative 4: Reduced Warehouse Alternative

The proposed Project would result in significant unavoidable GHG emissions. To reduce GHG impacts to a less than significant level, the size of the proposed warehouse would need to be substantially reduced by approximately 71 percent, which is equivalent to a 193,220-sf warehouse with 4 dock doors and 137 passenger vehicle parking spaces. Like the proposed Project, Alternative 4 would have 398 truck trailer parking spaces. Table 6-3: Alternative 4 and Proposed Project Comparison identifies a reduction of 471,639 sf of building area when compared to the proposed Project. The implementation of Alternative 4 would not use the entire 40-acre project site. This alternative assumes the truck trailer parking in the same location as assumed for the proposed Project. When compared to the proposed Project site plan, approximately one-half or more of the warehouse site (the southern portion of the site) would not be developed and would remain vacant.

Table 6-3: Alternative 4 and Proposed Project Comparison

Development Standard	Proposed Project	Alternative 4	Difference
Building Area (sf)	664,859	193,220	-471,639
Truck Trailer Parking	398	398	0
Employee Parking	365	137	-228

Alternative 4: Impact Comparison to the Proposed Project

Aesthetics. Because there are no scenic vistas proximate to the project site, neither Alternative 4 nor the proposed Project would adversely affect a scenic vista. Like the proposed Project, Alternative 4 would be required to be consistent with the development standards of the Specific Plan, General Plan, and Municipal Code. Both Alternative 4 and the Project would comply with applicable light and glare regulations, such as General Plan Policy 2-14.3, which requires the use of building materials that do not produce glare. Alternative 4 would be consistent with the visual quality of adjacent industrial, warehouse, and office land uses. Alternative 4 would include surface parking and landscaping. However, the southern portion of the site (perpendicular to Lowell Street) would not be developed. Although neither Alternative 4 nor the proposed Project would result in significant impacts associated with aesthetics, Alternative 4 would retain more of the project site in its current undeveloped condition resulting in less change in the visual character of the site.

Air Quality. Alternative 4 would result in the construction of a warehouse that is reduced by approximately 71 percent, which is equivalent to a 193,220-sf warehouse with 4 dock doors and 137 passenger vehicle parking spaces. Therefore, a shorter construction schedule, a less intensive site

preparation and grading phase of construction, and the use of less construction materials and equipment is anticipated. Accordingly, the maximum daily emissions during construction would be lower than the proposed Project. Therefore, Alternative 4 would result in lower construction emissions than the proposed Project.

Alternative 4 would also result in a decrease in average daily trips, which would result in lower mobile source emissions than the proposed Project. Alternative 4 would generate 330 daily trips, including 132 truck trips (553 daily PCE trips) compared to the 1,138 daily trips, including 455 truck trips (1,908 daily PCE trips) for the proposed Project. Alternative 4 would have similar stationary emission sources from mechanical equipment (e.g., HVAC units) and landscaping equipment for project site maintenance, although to a lesser degree than the proposed Project. This alternative would likely still require implementation of MM AQ-1 through MM AQ-5 to mitigate operational air quality impacts to a less than significant level. Air quality emissions would be proportionally lower than the proposed Project due to the decreased development square footage and average daily trips associated with Alternative 4. Potential impacts to air quality would remain less than significant with mitigation incorporated.

Biological Resources. Unlike the Project, Alternative 4 does not assume that the entire project site would be graded. The southern portion of the site would remain vacant and there would be a proportional reduction in the impact to biological resources. Although fewer acres would be disturbed, the significance of potential impacts would be the same and the mitigation program would be applicable to this alternative. Therefore, as with the proposed Project, impacts to biological resources associated with Alternative 4 would also be less than significant with mitigation incorporated.

Cultural Resources. Unlike the Project, Alternative 4 does not assume that the entire project site would be graded. Therefore, the area of potential impact would be reduced. The pedestrian survey conducted of the project site for this EIR found the entire site highly disturbed due to prior grading and development, with various instances of modern dumping and squatting observed. The field survey also confirmed the presence of resource CA-SBR-8696H at the project site, and noted the collapsing entry structure to the empty munitions bunker and historic debris. Although these resources have been determined not to be historically or archeologically significant, under this alternative the resources would remain in situ because that portion of the project site would not be developed. As with the Project, impacts to cultural resources associated with Alternative 4 would also be less than significant with mitigation incorporated.

Energy. Alternative 4 assumes the construction of a smaller warehouse than the proposed Project. The energy usage during construction associated with water usage for dust control, diesel fuel consumption from on-road hauling trips and off-road construction diesel equipment, and gasoline consumption from on-road worker commute and vendor trips would be lower than the Project due to the shorter construction schedule, less intensive site preparation and grading phase of construction, and the use of less construction materials and equipment. Additionally, Alternative 4 would result in a decrease in operational energy usage given this alternative would result in a decrease of 471,639 sf in the size of the warehouse. Energy usage would be proportionally lower than the proposed Project due to the decreased development square footage associated with Alternative 4. Potential impacts to energy would be less than the proposed Project.

Geology and Soils. Because less of the site would be developed, potential geological, soil, and paleontological resource impacts would incrementally lessen when compared to the Project. The potential for seismic ground shaking, fault rupture, liquefaction, or collapse would be the same as with

the proposed Project. Development under Alternative 4 would also be required to submit a site-specific geotechnical investigation, comply with California Building Code standards, and applicable construction and operational BMPs to reduce impacts related to geologic hazards. With respect to paleontological resources, the area of potential impact would be reduced. Impacts associated with both Alternative 3 and the Project would also be less than significant with mitigation incorporated.

Greenhouse Gas Emissions. Alternative 4 would result in the construction of a warehouse that is reduced by approximately 71 percent, which is equivalent to a 193,220-sf warehouse with 4 dock doors and 137 passenger vehicle parking spaces. Therefore, a shorter construction schedule, a less intensive site preparation and grading phase of construction, and the use of less construction materials and equipment is anticipated. Accordingly, direct emissions of GHGs from construction activities would be less than the proposed Project.

Additionally, Alternative 4 would result in a decrease in average daily trips compared to the Project. Alternative 4 would generate 330 daily trips, including 132 truck trips (553 daily PCE trips) compared to the 1,138 daily trips, including 455 truck trips (1,908 daily PCE trips) for the proposed Project. The reduction in square footage of the warehouse and decrease in average daily trips would reduce operational GHG emissions to a less than significant level. As such, Alternative 4 would result in less GHG emissions compared to the Project during construction and operations. Alternative 4 would avoid the need for implementation of MM GHG-1 through MM GHG-4 to reduce operational emissions. GHG emissions would be proportionally lower than the proposed Project due to the decreased development square footage and average daily trips associated with Alternative 4. Alternative 4 would have less than significant GHG impacts while the proposed Project would result in significant and unavoidable impacts regarding GHG emissions.

Hazards and Hazardous Materials. Alternative 4 would be developed on a portion of the project site while the southern part of the site would remain undeveloped. Alternative 4 does not assume the demolition of an ammunitions bunker and brick and mortar structure; therefore, MM HAZ-1 is not required. There is still the potential for the project site to contain UXOs or DMMs due to the historical use of the site. MMs HAZ-2 through MM HAZ-4 would be applicable to Alternative 4 to reduce potential impacts associated with potential UXOs and DMMs and soil contamination to a less than significant level. Like the Project, Alternative 4 would not expose persons on the project site to airport hazards, affect aircraft operations, or create an airport safety hazard for Project employees. Alternative 4 would include the operation of business office park and would not result in the release of hazardous materials. The routine use, storage, and transport of hazardous materials must adhere to federal, State, and local regulations for transport, handling, storage, and disposal of hazardous substances. Hazardous materials/chemicals such as fuels, cleaners, paints, solvents and fertilizers in low quantities do not pose a significant threat related to the release of hazardous materials into the environment. Additionally, there are no schools within 0.25-mile of the project site. Impacts associated with Alternative 4 and the proposed Project would be less than significant with mitigation incorporated.

Hydrology and Water Quality. The development footprint for Alternative 4 would be reduced when compared to the proposed Project. The amount of impervious surface would decrease when compared to the Project. Both Alternative 4 and the Project would be required to obtain a General Permit for Stormwater Discharge Associated with Construction Activity and prepare a SWQMP, which must include erosion-control and sediment control BMPs that would meet or exceed measures required by the Construction General Permit to control potential construction-related pollutants. The Project's operator

would also be required to prepare a water quality management plan pursuant to the City's Municipal Code Section 12.60.260. With respect to hydrology and water quality, impacts associated with Alternative 4 would be less than the proposed Project. Under both development scenarios, impacts would be less than significant with implementation of Standard Conditions.

Land Use and Planning. As with the Project, the Alternative 4 development scenario would not physically divide an established community through the introduction of either physical or community barriers and would not cause a significant environmental impact due to a conflict with any plan, policy, or regulation adopted to avoid or mitigate an environmental effect. Alternative 4 would comply with the land use designations of the site. Alternative 4 would be required to be consistent with the Rialto Airport Specific Plan, General Plan, and Municipal Code. Both Alternative 2 and the proposed Project would be consistent Connect SoCal. Additionally, neither scenario would introduce any roadways or infrastructure that would bisect or transect surrounding land uses. Therefore, both Alternative 4 and the Project would have a less than significant impact associated with land use and planning.

Mineral Resources. Potential mineral resource impacts for Alternative 4 would be similar to the Project although less of the site would be developed. The Department of Conservation's California Geological Survey maps (specifically, Special Report 206 Plate 2), the General Plan, and Rialto Airport Specific Plan do not identify the project site as an existing, planned, or potential mineral recovery site. As with the Project, Alternative 4 would be consistent with the existing land use designations of the project site. Neither the Project nor Alternative 4 would result in the loss of availability of a significant mineral resource and impacts would remain less than significant.

Noise. Alternative 4 would result in the construction of a warehouse that is reduced by approximately 71 percent. Therefore, Alternative 4 would result in less construction noise impacts than the proposed Project because of the shorter duration of construction. With respect to construction noise, impacts associated with Alternative 4 and the proposed Project would be less than significant with mitigation.

Alternative 4 would have lower average daily trips. Alternative 4 would generate 330 daily trips, including 132 truck trips (553 daily PCE trips) compared to the 1,138 daily trips, including 455 truck trips (1,908 daily PCE trips) for the proposed Project. Alternative 4 would result in less truck and passenger vehicle traffic volumes on nearby roadway segments compared to the proposed Project, resulting in lower roadway noise levels. The reduced building size for Alternative 4 would likely result in lower operational noise impacts when compared to the Project. Therefore, when compared to the proposed Project, Alternative 4 would have less noise impacts. Operational noise impacts associated with Alternative 4 and the proposed Project would both be less than significant.

Population and Housing. Both the Project and Alternative 4 would generate new permanent employment opportunities. Alternative 4 would have approximately 162 employees, based on an employment generation factor of one employee per 1,195 sf of warehouse use.[7] Using this generation factor, the proposed Project would employ approximately 557 employees. Similar to the Project, future employees are anticipated to travel to and from the site from within the City and surrounding area. Neither Alternative 4 nor the Project would require the construction of additional residential units that could induce substantial unplanned population growth not analyzed in the City's General Plan. Therefore, Alternative 4 would decrease the number of employees required for operations when compared to the

[7] Natelson Company, Inc, 2001, *Employment Density Study Summary Report Prepared for SCAG, Table 8A.*

proposed Project and impacts to population and housing would be lower. Under both development scenarios, impacts to population and housing would be less than significant.

Public Services. Development of both Alternative 4 and the Project would incrementally increase the demand for police and fire protection services. However, Alternative 4 would decrease the number of employees required for operations, which would reduce the demand on public services when compared to the proposed Project. Neither scenario is expected to substantially increase service demand such that a new or physically altered facility would need to be constructed, which would cause significant environmental impacts, to maintain acceptable service ratios, response times or other performance objectives for police and fire protection. Further, development impact fees are paid on a project-by-project basis to ensure a proportionate fair share is contributed toward facilities, equipment, and personnel that would be needed over time to accommodate the additional demand from a project. Alternative 4 would reduce the demand for fire and police protection services when compared to the proposed Project. Under both development scenarios, impacts would be less than significant.

Transportation. VMT impacts are measured based on the Citywide VMT per Service Population Threshold and the Countywide VMT per Employee Threshold. Alternative 4 would generate 330 daily trips, including 132 truck trips (553 daily PCE trips) compared to the 1,138 daily trips, including 455 truck trips (1,908 daily PCE trips) for the proposed Project. Alternative 4 would result in lower VMT impacts than the proposed Project. Under both scenarios, impacts would be less than significant.

Tribal Cultural Resources. Unlike the Project, Alternative 4 does not assume that the entire project site would be graded. Although less of the site would be disturbed, under both development scenarios there is a potential to discover previously unknown tribal cultural resources. Although the area of potential impact would be reduced, there would be no change in the significance of potential impacts. Therefore, as with the Project, impacts to tribal cultural resources associated with Alternative 4 would also be less than significant with mitigation incorporated.

Utilities and Service Systems. When compared to the Project, Alternative 4 would result in a decreased demand on utilities as the alternative would result in a decrease of 471,639 sf of building area. Under Alternative 4, a Water Supply Assessment would not be required. Because the Water Supply Assessment for the proposed Project did not identify significant impacts, a decrease of 471,639 sf would result in lower water demand as well as wastewater generation when compared to the Project during construction and operations. A smaller building would also result in a decreased demand for electrical power, natural gas, and telecommunication infrastructure. Alternative 4 would also result in lower solid waste generation because of the reduction of development on the project site. Alternative 4 would reduce the demand on utilities and service systems when compared to the proposed Project. Under both development scenarios, impacts would be less than significant.

Feasibility and Ability to Meet Project Objectives

Alternative 4 would not meet Project Objective 2 because the construction of a 193,200-sf warehouse, which is more than 71 percent smaller than the proposed Project on less than half of the 40-acre site, does not maximize “the efficient use of a vacant and underutilized and environmentally constrained site.” Further, Alternative 4 would not meet Project Objective 5 because a substantially smaller warehouse would have a different tenant base than would be associated with the size of the proposed Project; it may not be “an attractive development” that would “attract quality tenants” and “be competitive with other similar facilities in the region.” The significant reduction in total square footage presented in Alternative

4 is of a magnitude that is sufficiently severe as to render this alternative impractical. Based on the significantly reduced scope, Alternative 4 only partially meets the remaining Project Objectives. Alternative 4 would provide infrastructure improvements including street and sidewalk improvements, undergrounding of existing utilities, and drainage and water quality treatment improvements on Lowell Street and Locust Avenue, but potentially reduced in scale due to the smaller warehouse and development footprint. Additionally, the Reduced Warehouse Alternative would provide expanded economic activity to the City and provide additional employment opportunities, but to a substantially lesser degree than the proposed Project because it would be approximately 71 percent smaller. Alternative 4 would not conflict with the City's goals of expanding its economic base and providing greater economic opportunity to the City's residents, but it would do so to a lesser degree than the proposed project due to the reduced scale of the warehouse.

Conclusion

Alternative 4 would have a building area of approximately 193,220 sf, which is a reduction in development area of approximately 471,639 sf when compared to the proposed Project. Uses of Alternative 4 would be consistent with the Specific Plan and impacts would be similar to that of the Project, as identified in **Table 6-4**.

For environmental issues where project site disturbance would be the same for the proposed Project and Alternative 4, there would be no change in the significance of potential impacts. This would be the case for the topics of biological resources, cultural resources, geology and soils, hazards and hazardous materials, and tribal cultural resources which would be mitigated to a less than significant level. Similarly, this would also be the case for hydrology and water quality and mineral resources, which would be less than significant.

Neither Alternative 4 nor the Project would result in significant aesthetic impacts. Although the building square footage associated with Alternative 4 would decrease and parking and landscaping would be provided, the southern portion of the project site would not be developed and would remain vacant. With respect to traffic, Alternative 4 would result in a decrease in average daily trips and would result in lower VMT impacts than the proposed Project. Therefore, like the proposed Project, transportation impacts from Alternative 4 would be less than significant.

The reduction in square footage and average daily trips of Alternative 4 would likely result in lower air quality emissions, energy usage, GHG emissions, and noise impacts. A shorter construction schedule, a less intensive site preparation and grading phase of construction, and the use of less construction materials and equipment is anticipated. Accordingly, construction air quality emissions, GHG emissions, Energy usage and noise levels would be lower than the proposed Project. Further, the reduction in average daily trips associated with Alternative 4 would reduce operational air quality emissions, energy usage, GHG emissions, and noise impacts. As with the proposed Project, energy usage impacts would be less than significant and air quality emissions and noise impacts would still be less than significant with mitigation incorporated. Under Alternative 4, GHG emissions would be reduced to a less than significant level, while the proposed Project would result in a significant and unavoidable impact.

Alternative 4 would develop and operate a warehouse, but it would not maximize efficient use of a vacant and underutilized site that is near available infrastructure, major freeways, and other industrial developments, resulting in a smaller development project that would be less competitive in the marketplace to attract quality tenants. Alternative 4 would provide infrastructure improvements,

expanded economic activity to the City, and additional employment opportunities, but to a lesser degree than the proposed Project. Similarly, Alternative 4 would contribute to the City's goal of positively contributing to the economy through new capital investment, expansion of the tax base and creation of new employment opportunities, but to a lesser degree than the proposed Project.

Table 6-4: Summary of Proposed Project and Alternatives Impacts compares the alternative's anticipated environmental impacts with the implementation of mitigation, as required. **Table 6-5: Project Objectives Consistency Analysis** summarizes each alternative's ability to achieve the Project objectives.

Table 6-4: Summary of Proposed Project and Alternatives Impacts

Topic	Proposed Project	Alternative 1: No Development Alternative	Alternative 2: Truck Trailer Parking Alternative	Alternative 3: Business Park Alternative	Alternative 4: Reduced Warehouse Alternative

Project Objective	Alternative 1: No Development Alternative	Alternative 2: Truck Trailer Parking Alternative	Alternative 3: Business Park Alternative	Alternative 4: Reduced Warehouse Alternative
	Consistent?			
Objective 7: Provide local employment for residents of the City to improve jobs-housing balance within the City, thereby reducing the need for members of the local workforce to commute outside the Project vicinity to work.	No	Yes	Yes	Partially met
Objective 8: Provide infrastructure improvements including street and sidewalk improvements to Lowell Street and Locust Avenue, undergrounding of existing utilities, and drainage and water quality treatment improvements.	No	Yes	Yes	Yes
Objective 9: Develop a project that does not contribute to surface and groundwater quality degradation by treating surface and stormwater flows.	No	Yes	Yes	Yes

6.6 ENVIRONMENTALLY SUPERIOR ALTERNATIVE

CEQA Guidelines Section 15126.6(e)(2) requires that an Environmentally Superior Alternative be identified; that is, an alternative that would result in the fewest or least significant environmental impacts. If the "No Project" Alternative is the environmentally superior alternative, CEQA Guidelines Section 15126.6(e)(2) requires that another alternative that could feasibly attain most of the Project's basic objectives be chosen as the environmentally superior alternative.

The context of an environmentally superior alternative is based on the consideration of several factors including the reduction of environmental impacts to a less than significant level, the Project objectives, and an alternative's ability to fulfill the objectives with minimal impacts to the existing site and surrounding environment. As such, the No Project Alternative would be the environmentally superior alternative because it would eliminate all of the potentially significant impacts of the Project. However, while the No Project Alternative is the environmentally superior alternative, it is not capable of meeting any of the basic objectives for the Project.

The CEQA Guidelines state that should the No Project Alternative be the Environmentally Superior Alternative, the EIR shall identify another Environmentally Superior Alternative among the remaining Alternatives. Aside from the No Project Alternative, the environmentally superior alternative to the Project is the one that would result in the fewest or least significant environmental impacts. Based on the evaluation undertaken, it is assumed that Alternative 4: Reduced Warehouse Alternative is the environmentally superior Alternative. This is an environmentally superior project alternative because Alternative 4 would reduce GHG impacts to a less than significant level and reduce impacts to air quality, energy, noise, public services and utilities and service systems. Alternative 4 meets the requirements of the Rialto Airport Specific Plan development standards and therefore would be in conformance with all

applicable City regulations, including the goals and policies of the General Plan. This Alternative fails to meet two Project objectives and only partially meets the remaining Project objectives.

1.0 SUMMARY OF THE FINAL ENVIRONMENTAL IMPACT REPORT

1.1 INTRODUCTION

The City of Rialto (City) determined that a project-level environmental impact report (EIR) was required for the Locust Gateway Development Project (Project) pursuant to the requirements of the California Environmental Quality Act (CEQA). CEQA requires the preparation of an EIR prior to approving any project that may have a significant impact on the environment. For the purposes of CEQA, the term "proposed Project" refers to the whole of an action, which has the potential for resulting in a direct physical change or a reasonably foreseeable indirect physical change in the environment (CEQA Guidelines § 15378[a]).

The City determined that a Project EIR was the appropriate CEQA document for the proposed Project. In accordance with CEQA Guidelines Section 15161, a Project EIR "examines the environmental impacts of a specific development project. This type of EIR should focus primarily on the changes in the environment that would result from the development project. The EIR shall examine all phases of the project including planning, construction, and operation." The Locust Gateway Development Project EIR evaluates the potentially significant, adverse, and beneficial impacts on the environment resulting from implementation of the proposed Project. This document analyzes the environmental effects of the Project to the degree of specificity appropriate to the currently proposed actions, as required by CEQA Guidelines Section 15146. The EIR analysis considers the activities associated with the Project, to determine the short-term and long-term effects associated with their implementation. The EIR discusses both direct and indirect impacts of the Project, as well as cumulative impacts associated with other past, present, and reasonably foreseeable future projects.

Pursuant to Section 15082 of the CEQA Guidelines, as amended, the City of Rialto prepared and circulated a Notice of Preparation (NOP) to affected agencies and interested parties for a 30-day public review period beginning on June 27, 2024. The deadline to submit comments on the NOP was July 26, 2024. A public Scoping Meeting was held on July 11, 2024 at 6:00 PM at the Rialto City Hall Council Chambers, located at 150 S. Palm Avenue in the City of Rialto. Subsequently, a Draft EIR was prepared.

The Draft EIR was circulated for public review for a 45-day review period. The City published a Notice of Availability (NOA) for the Draft EIR on September 5, 2025, inviting comment from the general public, agencies, organizations, and other interested parties. The NOA was also mailed to various agencies, organizations, and individuals that had previously requested such notice. The public review period established by the City was from September 5, 2025 to October 20, 2025. The State Clearinghouse 45-day review period was from September 8, 2025 to October 22, 2025.

The City published a public Notice of Availability (NOA) for the Draft EIR on September 5, 2025, inviting comment from the general public, agencies, organizations, and other interested parties. The NOA was also mailed to various agencies, organizations, and individuals that had previously requested such notice. The NOA was filed with the State Clearinghouse (SCH# 2024061274) pursuant to the public noticing requirements of CEQA. The Draft EIR was released for public review and comment by the City of Rialto on September 5, 2025 for a 45-day review period ending on October 20, 2025. The State Clearinghouse 45-day review period was from September 8, 2025 to October 22, 2025.

1.2 CEQA REQUIREMENTS REGARDING COMMENTS AND RESPONSES

CEQA Guidelines Section 15132 states that the contents of a Final EIR shall consist of:

(a) The draft EIR or a revision of the draft.

(b) Comments and recommendations received on the draft EIR either verbatim or in summary.

(c) A list of persons, organizations, and public agencies commenting on the draft EIR.

(d) The responses of the Lead Agency to significant environmental points raised in the review and consultation process.

(e) Any other information added by the Lead Agency.

This Final EIR has been prepared to address comments received in response to the Draft EIR. Acting as lead agency, the City has prepared written responses to the Draft EIR pursuant to CEQA Guidelines Section 15088(a). CEQA Guidelines Section 15204(a) directs persons and public agencies to focus their review of a Draft EIR be "on the sufficiency of the document in identifying and analyzing possible impacts on the environment and ways in which significant effects of the project might be avoided or mitigated. Comments are most helpful when they suggest additional specific alternatives or mitigation measures that would provide better ways to avoid or mitigate the significant environmental effects. At the same time, reviewers should be aware that the adequacy of an EIR is determined in terms of what is reasonably feasible. …CEQA does not require a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters. When responding to comments, lead agencies need only respond to significant environmental issues and do not need to provide all information requested by reviewers, as long as a good faith effort at full disclosure is made in the EIR."

CEQA Guidelines Section 15204(c) further advises, "Reviewers should explain the basis for their comments, and should submit data or references offering facts, reasonable assumptions based on facts, or expert opinion supported by facts in support of the comments. Pursuant to CEQA Guidelines Section 15064, an effect shall not be considered significant in the absence of substantial evidence." Section 15204(d) states, "Each responsible agency and trustee agency shall focus its comments on environmental information germane to that agency's statutory responsibility." CEQA Guidelines Section 15204(e) states, "This section shall not be used to restrict the ability of reviewers to comment on the general adequacy of a document or of the lead agency to reject comments not focused as recommended by this section."

CEQA Guidelines Section 15088(a) states that the "The lead agency shall evaluate comments on environmental issues received from persons who reviewed the draft EIR and shall prepare a written response. The lead agency shall respond to comments raising significant environmental issues received during the noticed comment period and any extensions and may respond to late comments." Section 15088(c) notes "The written response shall describe the disposition of significant environmental issues raised (e.g., revisions to the proposed project to mitigate anticipated impacts or objections). In particular, the major environmental issues raised when the lead agency's position is at variance with recommendations and objections raised in the comments must be addressed in detail giving reasons why specific comments and suggestions were not accepted. There must be good faith, reasoned analysis in response. Conclusory statements unsupported by factual information will not suffice. The level of detail contained in the response, however, may correspond to the level of detail provided in the comment (i.e., responses to general comments may be general). A general response may be appropriate when a comment does not contain or specifically refer to readily available information, or does not explain the

relevance of evidence submitted with the comment." Comments received on the Draft EIR are responded to in **Section 2.0: Responses to Comments** in this Final EIR.

State CEQA Guidelines Section 15088(d) recommends that where a response to comment makes important changes in the information contain in the text of the Draft EIR, that the Lead Agency either revise the text of the EIR or include marginal notes showing that information. Changes to the EIR text are shown in underlined text for additions and ~~strikeout~~ for deletions in **Section 3.0: Errata to the EIR** of this Final EIR.

Responses to comments received during the comment period do not require any new information to be added to the EIR, thus the Final EIR does not contain any new significant impacts or "significant new information" that would require recirculation of the Draft EIR pursuant to CEQA Guidelines Section 15088.5. None of the clarifications or changes made in the Errata reflect a new significant environmental impact, a "substantial increase" in the severity of an environmental impact for which mitigation is not proposed, or a new feasible alternative or mitigation measure that would clearly lessen significant environmental impacts. Nor do the Errata reflect a "fundamentally flawed" or "conclusory" Draft EIR. In all cases, as discussed in individual responses to comments and Errata, these minor clarifications and modifications do not identify new or substantially more severe environmental impacts that the City has not committed to mitigate. Therefore, the public has not been deprived of a meaningful opportunity to comment upon a substantial adverse environmental effect of the Project or a revised or new feasible Project alternative or mitigation measure. Instead, the information added supports the existing analysis and conclusions, and responds to inquiries made from commenters.

Public Resources Code Section 21092.5 requires that copies of the written responses to public agencies be provided to those agencies at least ten days prior to certifying the EIR by the Lead Agency. It is the City's policy to provide notification of the availability of written responses to comments to all parties providing comments on the Draft EIR. Further, the City provides such notification prior to first consideration of a project by the Planning Commission.

1.3 ACTIONS BY THE LEAD AGENCY

As previously noted, consistent with CEQA Guidelines Section 15132, the Final EIR for the Locust Gateway Development Project consists of the Draft EIR and its technical appendices; the list of parties commenting on the Draft EIR; the Responses to Comments included herein; and any other information added by the Lead Agency. The City Council will also consider adoption of a Mitigation Monitoring and Reporting Program (MMRP) which is provided in **Section 4.0: Mitigation Monitoring and Reporting Program**; a Statement of Findings of Fact, and a Statement of Overriding Considerations as part of the approval process for the Project.

The Final EIR, along with other relevant information and public testimony at the Planning Commission public hearing, will be considered by the City Council in determining whether to certify the Final EIR and approve the Project. Other relevant information includes:

- Notice of Preparation (NOP) and written comments received on the NOP
- Notice of Availability (NOA)
- All other public notices issued by the City associated with the Project

- Any documents incorporated by reference therein and other site-specific and/or project-specific technical studies and exhibits not included in the FEIR but explicitly referenced therein."
- All written and verbal public testimony presented during public hearings for the proposed Project at which public testimony was taken at the Planning Commission and City Council hearings.

1.4 PROJECT SUMMARY

The project site is located on Assessor Parcel Number (APN) 0239-19-223, at the southwest corner of the Locust Avenue and Lowell Street intersection, in the City of Rialto, County of San Bernardino, California. The approximately 40-acre project site ranges in elevation from 1,612 to 1,649 feet above mean sea level (amsl). The project site is generally bordered by the unincorporated community of Muscoy to the north, the cities of San Bernardino and Colton to the east, the City of Jurupa Valley to the south, and the City of Fontana to the west.

The Project would allow for the development of a 664,859-square-foot (sf) building with 657,146 sf of warehouse space and 4,112 sf of ancillary office space in the northeast corner of the first floor and 3,601 sf of ancillary office space on the mezzanine level. The Project would also have 365 passenger vehicle surface parking stalls, 398 truck trailer parking stalls split between two areas on the site, and 82 dock doors.

The project site has a Rialto General Plan (General Plan) land use designation of General Industrial. The General Industrial land use designation allows for a broad range of heavy industrial activities. The project site is zoned Rialto Airport Specific Plan. The Rialto Airport Specific Plan provides a framework to guide future land use and development decisions in the Specific Plan area. The Rialto Airport Specific Plan designates the project site as General Manufacturing (I-GM), which permits wholesale and warehousing operations. A Conditional Development Permit would be required for the development of a warehouse, which is a conditionally permitted use in industrial zones in the City. As such, the proposed Project will be consistent with the existing General Plan land use designation and Specific Plan zoning.

1.5 PROJECT OBJECTIVES

Section 15124(b) of the CEQA Guidelines (14 CCR) requires "A statement of objectives sought by the proposed Project. The following objectives have been identified for the Project.

Objective 1: Develop and operate a warehouse that is in close proximity to three major freeways (State Route 210, Interstate 215 and Interstate 15) to support the distribution of goods throughout the region and that also limits traffic truck disruption to residential areas within the City and neighboring jurisdictions.

Objective 2: Develop and operate a warehouse that maximizes the efficient use of a vacant and underutilized and environmentally constrained site near available infrastructure, to allow the City of Rialto to compete on a domestic and international scale through the efficient and cost-effective movement of goods.

Objective 3: Develop a warehouse in an appropriate location that is predominantly surrounded by other industrial uses and is consistent with the project site's General Manufacturing land use designation under the Rialto Airport Specific Plan.

Objective 4: Maximize the efficient movement of goods throughout the region by locating a warehouse development in close proximity to the Ports of Los Angeles and Long Beach.

Objective 5: Develop and operate an attractive warehouse development in the City of Rialto that meets industry standards for operational design criteria that will attract quality tenants and that will be competitive with other similar facilities in the region.

Objective 6: Positively contribute to the economy of the City of Rialto through new capital investment, expansion of the tax base and creation of new employment opportunities, including opportunities for highly trained workers.

Objective 7: Provide local employment for residents of the City to improve jobs-housing balance within the City, thereby reducing the need for members of the local workforce to commute outside the Project vicinity to work.

Objective 8: Provide infrastructure improvements including street and sidewalk improvements to Lowell Street and Locust Avenue, undergrounding of existing utilities, and drainage and water quality treatment improvements.

Objective 9: Develop a project that does not contribute to surface and groundwater quality degradation by treating surface and stormwater flows.

1.6 REQUIRED PERMITS AND APPROVALS

Pursuant to Section 15121 of the CEQA Guidelines, an EIR is primarily an informational document intended to inform the public agency decision-makers and the general public of the potentially significant environmental effects of a project. Prior to taking action on the proposed Project, the City must consider the information in this EIR and certify the Final EIR.

The City of Rialto, as lead agency for the Project, has discretionary authority over the primary approvals. The Applicant has requested the consideration of the following discretionary actions.

- **Certification of the Locust Gateway Project Final Environmental Impact Report (Environmental Assessment Review No. 2023-0051):** Environmental review under the California Environmental Quality Act is required for the proposed Project.
- **Precise Plan of Design (PPD) (PPD 2023-0041):** Site development of one 664,859-sf warehouse building and associated improvements including loading area, truck parking, paving, screening, landscaping, lighting, stormwater retention on a single parcel (0239-19-223) of approximately 40 acres.
- **Conditional Development Permit (CDP) (2023-0032):** Conditional Development Permit for the development of a warehouse, which is a conditionally permitted use in industrial zones within the City of Rialto.
- **Tentative Parcel Map (TPM) (TPM 2023-0006):** To create one parcel and one lettered lot, and to depict the required City right-of-way dedication for Lowell Street, vacations, and easements.
- **Development Agreement (DA) (2024-0002)**

In addition to the approvals identified above, the Project would be subject to other discretionary and ministerial actions by the City as part of Project implementation. Additional City approvals include but are not limited to haul route permits, site development permits, grading permits, use permits, sign permits, and building permits.

Approvals would also be required from the following agencies:

- **Santa Ana Regional Water Quality Control Board (RWQCB):** Issuance of a National Pollution Discharge Elimination System (NPDES) Permit and Construction General Permit.
- **California Department of Fish and Wildlife:** Issuance of an Incidental Take Permit for the Crotch's bumblebee.

2.0 RESPONSES TO COMMENTS

2.1 INTRODUCTION TO RESPONSES TO COMMENTS

The purpose of this section is to present public comments and responses to comments received on the Draft Environmental Impact Report (Draft EIR) (State Clearinghouse Number 2024061274) for the Locust Gateway Development Project located in the City of Rialto (City).

In accordance with the California Environmental Quality Act (CEQA) Guidelines Section 15088, the City of Rialto, as the Lead Agency, has evaluated all substantive comments received on the Locust Gateway Development Project Draft EIR, and has prepared written responses to these comments. This document has been prepared in accordance with CEQA and represents the independent judgment of the Lead Agency.

Section 2.0: Responses to Comments is organized as follows:

Section 2.1 Provides a brief introduction to this section.

Section 2.2 Identifies the Draft EIR commenters.

Section 2.3 Provides responses to substantive comments received on the Draft EIR.

2.2 LIST OF RESPONDENTS

In accordance with CEQA Guidelines Section 15132, the following is a list of public agencies, organizations and individuals and businesses that submitted comments on the Draft EIR received as of close of the State Clearinghouse public review period on October 22, 2025.

The City of Rialto received a comment letter from Advocates for the Environment after close of the public review period on October 29, 2025. It is important to note that CEQA does not require the lead agency to respond to late comments, to reopen the comment period, or delay acting on an EIR (Public Resources Code
§§ 21091(d)(1), 21092.5(c)). Public Resources Code Section 21091(d)(2)(A) notes that the lead agency may respond to comments that are received after the close of the public review period.

In addition to the comment letters received during the public review period, the City of Rialto has also prepared a response to the late comment letter. All responses are provided in Section 2.3.

Re: Locust Gateway Development Project
SCH No. 2024061274

To Daniel Casey,

On behalf of the Western States Regional Council of Carpenters, we write to express our strong support for the proposed Locust Gateway Development Project in the City of Rialto. This project represents an important opportunity to bring high-quality jobs, vital infrastructure improvements, and long-term economic benefits to our community.

As a labor organization committed to creating and sustaining good-paying jobs for local skilled & trained workers, we believe this project will create these opportunities during the construction phase and additional jobs once the facility is complete.

Providing local career opportunities for skilled workers and trained professionals not only strengthens the local workforce but also reduces commute times for working families who live in the City of Rialto and allows more time for recreation and connection within the community, ultimately contributing to local prosperity and shared community wealth.

We respectfully urge the City to advance this project and ensure quality jobs, safety, and economic growth, keeping Rialto a place where working families can thrive.

A1-1

With appreciation,

Jacob Lopez

Re: **Support for the Locust Gateway Development Project (PPD 2023-0041, CDP 2023-0032, TPM 2023-0006, DA 2024-0002)**

Dear Honorable Mayor and City Council Members:

I am writing on behalf of the United Association (UA) Local 364 Plumbers & Pipefitters to express our enthusiastic support for the proposed Locust Gateway Development Project.

We are excited for Brookfield Properties' efforts at this site in particular, because of the site's long history of underutilization and as part of a Superfund Site. Through development of the site, they are turning a long vacant piece of land into an attractive warehouse building and use that is consistent with and complimentary to the surrounding industrial uses.

We also appreciate the Applicant's commitment to local hire that will provide opportunities for our local skilled and highly trained construction workforce, including our highly trained plumbers and pipefitters. We look forward to this project being built and we urge you to approve it expeditiously so we may call on our workers, many of whom are residents of Rialto and its neighboring cities, with an opportunity to share in the benefits of this development by working on a local project.

Again, UA Local 364 enthusiastically supports the Locust Gateway Development Project.

A2-1

Sincerely,

Joe Raymond
Business Manager

Response A2-1

This comment acknowledges support for the Project by the United Association Local 364 Plumbers & Pipefitters. The letter of support does not raise any specific issues or questions on the environmental analysis provided in the Draft EIR. No further response is required.

Re: Support for the Locust Gateway Development Project

Dear Honorable Mayor and City Council Members:

On behalf of Reinforcing Ironworkers Local 416, I respectfully add our organization's name to the list of supporters of the Locust Gateway Development Project.

After further reviewing this project, Local 416 is satisfied that the project will maximize community, economic, and employment benefits and protect worker health and safety. In particular, the Applicant's commitment to local hire will ensure that skilled and trained local construction workers who build the project will be paid living wages, work in a safe worksite, and receive good benefits for their work. A3-1

In doing so, Brookfield Properties will not only transform an underutilized site into an engine of economic growth and development, but they have also demonstrated an overriding commitment to helping the local economy remain robust.

Therefore, Local 416 urges the City Council to expeditiously approve all requested entitlements to make the safe and timely Locust Gateway Development Project a reality. Thank you for your time and consideration.

Sincerely,

Frankie Jimenez

RE: Locust Gateway Development Project (PPD 2023-0041, CDP 2023-0032, TPM 2023-0006, DA 2024-0002

Dear Honorable Mayor and City Council Members:

On behalf of Ironworkers Local 433 ("Local 433"), I am submitting this letter of support for the proposed Locust Gateway Development Project. Brookfield Properties is proposing to develop a 666,265-square-foot (sf) industrial warehouse building with 656,265 sf of warehouse space, 5,000 sf of office space, and 5,000 sf of an office mezzanine.

We are pleased that Brookfield Properties has chosen to build their project in an equitable and responsible manner that places the needs of the community at present and in the future at the forefront. They have committed to helping the local economy remain robust and favorable by creating employment opportunities while supporting the local, skilled, and professional construction workforce, including the Ironworkers. A4-1

This project is proposed at the right place and time to make a real difference for the City of Rialto. Local 433 respectfully and enthusiastically supports approval for all entitlements requested to make this safe, timely, and needed project a reality.

Sincerely,

K + B. H

Keith Harkey
Business Manager

Subject: Comments on Locust Gateway Development Project EIR (SCH NO. 2024061274)

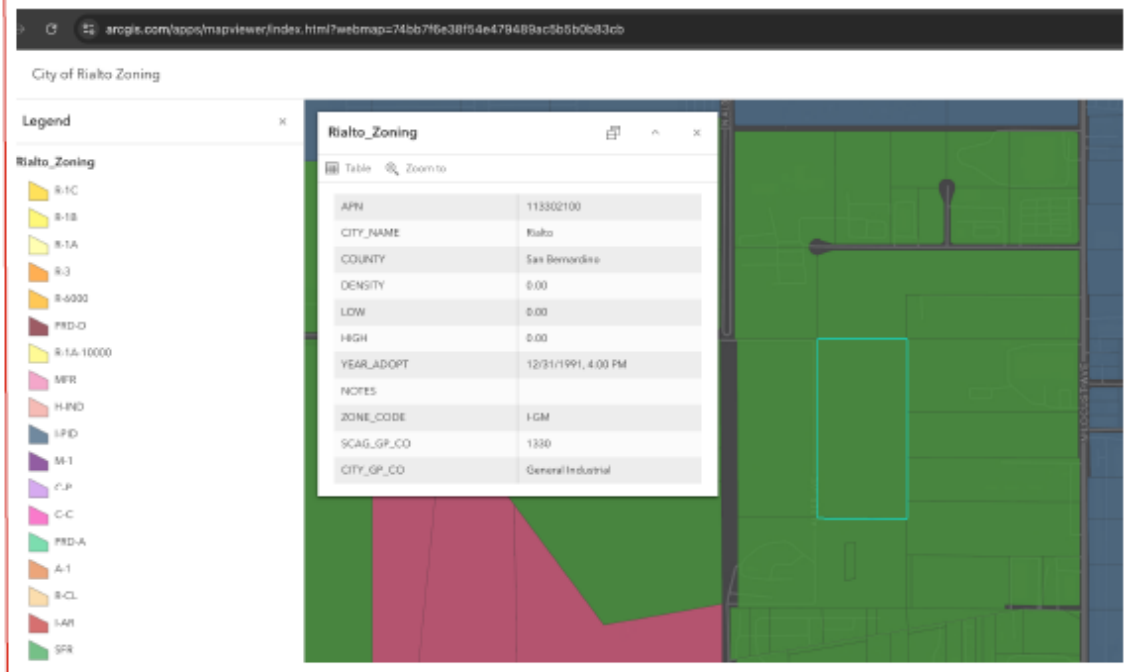
Dear Mr. Casey,

Thank you for the opportunity to comment on the Environmental Impact Report (EIR) for the proposed Locust Gateway Development Project. Please accept and consider these comments on behalf of Golden State Environmental Justice Alliance. Also, Golden State Environmental Justice Alliance formally requests to be added to the public interest list regarding any subsequent environmental documents, public notices, public hearings, and notices of determination for this project. Send all communications to Golden State Environmental Justice Alliance P.O. Box 79222 Corona, CA 92877. A5-1

1.0 Summary
The project proposes the construction and operation of an approximately 664,859 square foot (sf) warehouse, inclusive of approximately 7,713 sf of ancillary office space. The 40 acre project site provides 365 passenger vehicle parking stalls, 398 truck/trailer parking stalls, and a fence-secured truck/trailer loading dock area with 82 dock doors. Access to the project site would be provided via three new driveways on Lowell Street, one driveway on Locust Avenue, and one emergency vehicle only driveway on Lake Padden Lane. A5-2

3.0 Project Description
The EIR does not adequately describe the project. For example, the EIR states that the project is located on a single Assessors Parcel Number (APN): 0239-19-223. However, it is clear that the project site is bisected by the planned extension of Summit Avenue (refer to Transportation section below) and this is not disclosed in the EIR. The APN for the southern half of the project site is 1133-02-100. Figure 3-11: Tentative Parcel Map does not depict that there are two existing parcels. A5-3

The EIR must be revised to disclose this information and it include for discussion and analysis throughout the document.



A5-3

Additionally, the EIR states that, "Approximately 270,000 cubic yards (cy) of cut and 300,000 cy of fill are anticipated for a net fill (imported soil) of 30,000 cy." However, the EIR does not provide any substantial evidence to support this statement, such as a grading plan. Verification of the import/export materials is vital as it directly informs the quantity of necessary truck hauling trips due to soil import/export during project construction. The EIR does not provide any information regarding the nearest available import site, either. It is clear that the grading plan has been completed since the applicant has applied for permit ENGGR25-0027[1] for On-Site Precise Grading Plans for PPD#2023-0041. The EIR must be revised to provide a a wholly accurate grading plan and a specific soil import site and its precise distance from the project site in order to provide an adequate, accurate environmental analysis and informational document.

A5-4

4.2 Air Quality, 4.5 Energy, and 4.7 Greenhouse Gas Emissions

The EIR does not include for analysis relevant environmental justice issues in reviewing potential impacts, including cumulative impacts from the proposed project. This is in conflict with CEQA Guidelines Section 15131 (c), which requires that "Economic, social, and particularly housing

A5-5

[1] https://cityofrialtoca-energovweb.tylerhost.net/apps/selfservice#/permit/16c7426c-03db-4715-8263-bfa96e3598cd

factors shall be considered by public agencies together with technological and environmental factors in deciding whether changes in a project are feasible to reduce or avoid the significant effects on the environment identified in the EIR. If information on these factors is not contained in the EIR, the information must be added to the record in some other manner to allow the agency to consider the factors in reaching a decision on the project." This is especially significant as the surrounding community is highly burdened by pollution. See also the attached air quality comments and analysis from SWAPE.

A5-5

According to CalEnviroScreen 4.0[2], CalEPA's screening tool that ranks each census tract in the state for pollution and socioeconomic vulnerability, the proposed project's census tract (6071002704) ranks in the 94th percentile for overall pollution burden, meaning that it is among the communities that are most severely burdened by pollution in the state. The surrounding community bears the impact of multiple sources of pollution and is more polluted than average on several pollution indicator measured by CalEnviroScreen. For example, the project census tract ranks in the 99th percentile for ozone burden, the 76th percentile for particulate matter (PM) 2.5 burden, the 53rd percentile for diesel PM burden, and 61st percentile for traffic burden. All of these environmental factors are attributed to heavy truck activity in the area. While California has strict vehicle-emissions standards, exhaust from cars and trucks is the main source of air pollution in much of the state[3]. Ozone can cause lung irritation, inflammation, and worsening of existing chronic health conditions, even at low levels of exposure[4]. Exhaust fumes contain toxic chemicals that can damage DNA, cause cancer, make breathing difficult, and cause low weight and premature births[5].

A5-6

The census tract also ranks in the 85th percentile for hazardous waste facility impacts and 94th percentile for solid waste facility impacts. Hazardous waste generators and facilities contribute to the contamination of air, water and soil near waste generators and facilities can harm the environment as well as people[6]. Solid waste facilities can expose people to hazardous chemicals, release toxic gases into the air (even after these facilities are closed), and chemicals can leach into soil around the facility and pose a health risk to nearby populations[7].

A5-7

The census tract ranks among the most severely impacted in several areas that impact water quality. The census tract ranks in the 97th percentile for groundwater threats. People who live near

A5-8

[3] OEHHA Traffic https://oehha.ca.gov/calenviroscreen/indicator/traffic-density
[4] OEHHA Ozone https://oehha.ca.gov/calenviroscreen/indicator/air-quality-ozone
[5] OEHHA Traffic https://oehha.ca.gov/calenviroscreen/indicator/traffic-density
[6] OEHHA Hazardous Waste Generators and Facilities https://oehha.ca.gov/calenviroscreen/indicator/hazardous-waste-generators-and-facilities
[7] OEHHA Solid Waste Facilities https://oehha.ca.gov/calenviroscreen/indicator/solid-waste-sites-and-facilities

contaminated groundwater may be exposed to chemicals moving from the soil into the air inside their homes[8]. Accordingly, the census tract ranks in the 96th percentile for drinking water impacts, which indicates that it ranks with the worst quality drinking water in the state. Poor communities and people in rural areas are exposed to contaminants in their drinking water more often than people in other parts of the state[9]. A5-8

The census tract also bears more impacts from cleanup sites than 88% of the state. Chemicals in the buildings, soil, or water at cleanup sites can move into nearby communities through the air or movement of water[10]. A5-9

Further, the census tract is a diverse community including 46% Hispanic, 14% African-American, and 12% Asian-American residents, whom are especially vulnerable to the impacts of pollution. The community has a high rate of low educational attainment, meaning 49% of the census tract residents over age 25 has not attained a high school diploma. The community also has a high rate of poverty, meaning 37% of the households in the census tract have a total income before taxes that is less than the poverty level. Income can affect health when people cannot afford healthy living and working conditions, nutritious food and necessary medical care[11]. Poor communities are often located in areas with high levels of pollution[12]. Poverty can cause stress that weakens the immune system and causes people to become ill from pollution[13]. Living in poverty is also an indication that residents may lack health insurance or access to medical care. Medical care is vital for this census tract as it ranks in the 83rd percentile for incidence of cardiovascular disease and 48th percentile for incidence of asthma. The community also has a high rate of linguistic isolation, meaning 40% of the census tract speaks little to no English and faces further inequities as a result. A5-10

Additionally, the proposed project's census tract (6071002704) and the census tracts adjacent to the project site (6071002301 (south), 6071003503 (southeast), and 6071003506 (southeast)) are identified as SB 535 Disadvantaged Communities[14]. This indicates that cumulative impacts of development and environmental impacts in the City are disproportionately impacting these communities. The EIR does not discuss that the project site and surrounding area are disadvantaged communities, does not utilize this information in its analysis, and has not considered the project's significant environmental impacts in relation to the SB 535 status of the project census tract and A5-11

surrounding area. Notably, more than 44% of the goods bought and consumed in the United States pass through the Inland Empire on their way to their final destinations. The impacts of the warehousing and logistics industry in Rialto have become distinctly inequitable. The severity of impacts is demonstrated by SCAG funding a partnership with UCR[15] to conduct a truck route study in Rialto- Smart Cities Plan to Mitigate Impacts of Warehousing and Logistics.

A5-11

The EIR states that, "The Code California Energy Code (Title 24, Part 6) was created as part of the California Building Standards Code (Title 24 of the California Code of Regulations) by the California Building Standards Commission in 1978 to establish statewide building energy efficiency standards to reduce California's energy use. In general, Title 24 energy code is designed to reduce wasteful and unnecessary energy consumption in newly constructed and existing buildings." Title 24 Energy requirements are applicable plans and laws for energy efficiency in California. The State of California lists three approved compliance modeling softwares[16] for non-residential buildings: CBECC-Com, EnergyPro, and IES VE. The EIR utilizes CalEEMod and EFMAC as sources in its methodology and analysis, which is clearly not an approved software. The modeling does not comply with the 2022 Building Energy Efficiency Standards and under-reports the project's significant Energy impacts and fuel consumption to the public and decision makers. The EIR has not analyzed the project in accordance with Title 24 Energy requirements, including providing an analysis of energy consumption utilizing one of the approved compliance modeling softwares for non-residential buildings. Therefore, it is unknown if the project conflicts with or obstructs an applicable state or local plan for renewable Energy or Energy efficiency. This necessitates a finding of significance in a revised EIR.

A5-12

4.10 Land Use and Planning

The EIR does not discuss or analyze the project's compliance with the General Plan's Land Use buildout scenario. Table 2-3: Land Use Build Out of the Updated Rialto General Plan Land Use Element[17] states that the General Industrial designation supports the development of 17,181,000 sf of industrial space through the document's 2040 horizon year. The project's proposed 664,859 sf of industrial space is 3.8% of the total industrial space permitted over the 30 year General Plan period, which represents a significant amount of growth attributed to a single project. The EIR also does not discuss or analyze the project's compliance with the Rialto Airport Specific Plan buildout

[17] https://rialto.legistar.com/View.ashx?M=F&ID=13534009&GUID=DB438E29-5773-4F43-BA45-F3F9B078985E

scenario. A revised EIR must be prepared to include all of the above-stated analysis in order to provide an adequate informational document.

A5-13

The EIR provides an analysis with three goals/policies from SCAG's 2024 Connect SoCal RTP/SCS[18]. The EIR has exclude relevant analysis regarding the project's significant and unavoidable cumulatively considerable GHG impacts. Due to errors in modeling, modeling without supporting evidence (as noted throughout this comment letter), and the EIR's determination that the project will generate significant and unavoidable cumulatively considerable Greenhouse Gas Emissions, the proposed project is directly inconsistent with the following and a revised EIR must be included with a finding of significance:

1. Equitable Engagement and Decision-Making Policy 46. Promote racial equity that is grounded in the recognition of the past and current harms of systemic racism and one that advances restorative justice.

2. Equitable Engagement and Decision-Making Policy 47. Increase equitable, inclusive, and meaningful representation and participation of people of color and disadvantaged communities in planning processes.

3. Sustainable Development Policy 48. Promote sustainable development and best practices that enhance resource conservation, reduce resource consumption and promote resilience.

A5-14

4. Sustainable Development Policy 49. Support communities across the region to advance innovative sustainable development practices.

5. Sustainable Development Policy 50. Recognize and support the diversity of communities across the region by promoting local place-making, planning and development efforts that advance equity, mobility, resilience and sustainability.

6. Air Quality Policy 51. Reduce hazardous air pollutants and greenhouse gas emissions and improve air quality throughout the region through planning and implementation efforts.

7. Air Quality Policy 52. Support investments that reduce hazardous air pollutants and greenhouse gas emissions.

8. Air Quality Policy 53. Reduce the exposure and impacts of emissions and pollutants and promote local and regional efforts that improve air quality for vulnerable populations, including but not limited to Priority Equity Communities and the AB 617 Communities.

[18] https://scag.ca.gov/sites/default/files/2024-05/23-2987-connect-socal-2024-final-complete-040424.pdf

9. Climate Resilience Policy 64. Prioritize the most vulnerable populations and communities subject to climate hazards to help the people, places and infrastructure that are most at risk for climate change impacts. In doing so, recognize that disadvantaged communities are often overburdened.

10. Climate Resilience Policy 65. Support local and regional climate and hazard planning and implementation efforts for transportation, land use, and other factors.

11. Climate Resilience Policy 66. Support nature-based solutions to increase regional resilience of the natural and built environment.

A5-14

Table 4.10-1: General Plan Consistency Analysis within the EIR does not provide any substantial or meaningful evidence to support the claim that the project does not conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. A revised EIR must be prepared to provide a consistency analysis with all of the most updated versions of the General Plan objectives, goals, policies, and actions, including but not limited to the following:

1. Policy 2–9.4: Encourage industrial uses to incorporate flexible commercial spaces such as retail, restaurants, and temporary vendors that can serve a broad audience.
2. Policy 2–12.2: Provide and maintain street trees and parkway landscaping within the public right-of-way for developed properties within Rialto. Require private development to do the same as per City design regulations.
3. Policy 2–16.1: Encourage the incorporation of public art into large-scale development projects.
4. Policy 2–17.3: Discourage architectural monotony.
5. Policy 2–17.4: Discourage the design of boxy structures; emphasize articulation of the front façade and the horizontal plane with multistory structures.
6. Goal 2–27: Maximize open spaces in urban areas.
7. Policy 2–27.1: Require that private open space be integrated into new development by providing green spaces and landscaped plazas between buildings.
8. Policy 2–27.2: Enhance street corridors by incorporating small green areas, extensive landscaping, and street trees.
9. Policy 2–27.3: Explore opportunities to create pocket parks within urbanized areas for public and/or private use.
10. Policy 2–37.1: Put conditions on discretionary permits to require fugitive dust controls.

A5-15

In finding consistency with Policies 4-1.20 and 4-1.21, the EIR states that, "LOS is not used under CEQA to evaluate traffic impacts." It is a commonly perpetuated misconception that when the

A5-16

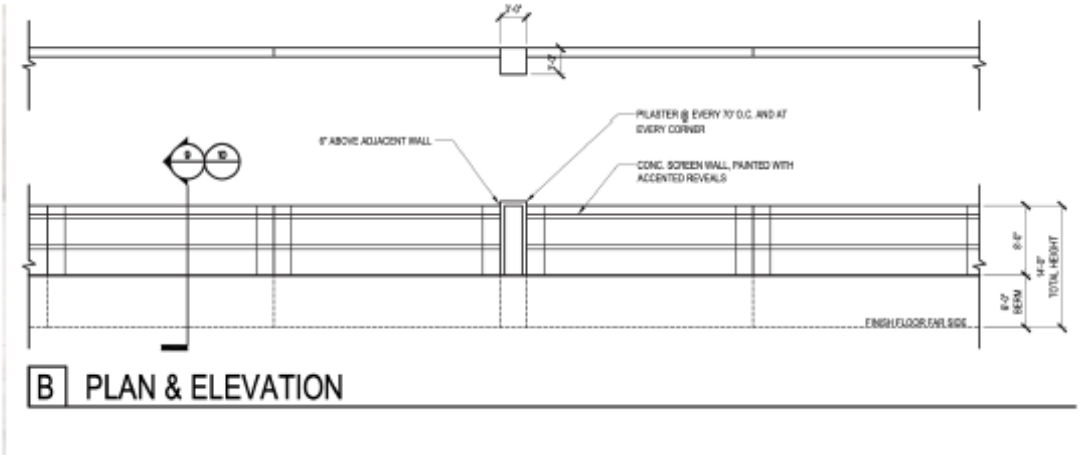
Daniel Casey
October 16, 2025
Page 8

State added VMT as a required analysis under CEQA, it removed any need for LOS analysis. The threshold of significance poses the question whether the project conflicts with plans and policies addressing the circulation system. The City has adopted policies with LOS requirements for signalized intersections and delay requirements for unsignalized intersections, both of which are components of the circulation system. Therefore, an LOS analysis is required. The EIR has not provided a LOS analysis or any substantial evidence to support a less than significant finding, and therefore a finding of significance is required in a revised EIR.

A5-16

Additionally, the EIR states that the project is consistent with "Policy 2–12.1: Require the screening of commercial or industrial parking areas, storage yards, stockpiles, and other collections of equipment from the public right-of-way," but the project does not screen the parking area adjacent to Lake Padden Lane. The EIR concludes the project is consistent with, "Policy 2–12.5: Require that projects with perimeter walls (including gated residential communities) provide an interesting streetscape, with pedestrian access to major travel ways," because then project provides pedestrian access to the project site and references other responses that include statements regarding trees and a 14 foot high "decorative" screen wall around the perimeter of the property. The analysis does not provide any substantial evidence to support compliance, such as a streetscape analysis or color renderings of the 14 foot high "decorative" screen wall. Figure 3-9: Conceptual Fence and Wall Plan depicts an elevation view of the "decorative" screen wall, but does not provide any meaningful details such as paint colors. A concrete screen wall with heavy pilasters every 70 feet and unknown painted details does not substantially comply with the requirement of Policy 2–12.5 to provide an interesting streetscape. Notably, the 14 foot high "decorative" screen wall will only be constructed along Locust Avenue and Lowell Street. The remainder of the site and streetscape will feature concrete retaining walls topped with 8 foot high wrought iron fencing. The EIR has not provided any substantial evidence to demonstrate compliance with the above listed policies and a finding of significance must be included in a revised EIR.

A5-17



The EIR states that the project is consistent with "Policy 2-17.1: Require new development and construction to exhibit a high level of quality architectural design to emphasize community uniqueness, individuality, and historical references," and, "Policy 2–23.1: Require that developments incorporate varied planes and textures and variety in window and door treatments on building façades," because the building, "includes concrete tilt-up panels with architectural treatments, such as panel reveals to provide visual relief of the building facades," and, "the exterior elevations would be white and grey with blue accents and blue window glazing." These basic industrial building concepts do not constitute high-quality architectural design emphasizing the community nor incorporate varied planes and textures. The building is a standard concrete tilt-up rectangular box, which is directly inconsistent with the above policies and, "Policy 2–17.3: Discourage architectural monotony," and, "Policy 2–17.4: Discourage the design of boxy structures; emphasize articulation of the front façade and the horizontal plane with multistory structures." The EIR has not included substantial evidence to support a less than significant finding and a revised EIR must be prepared to include a finding of significance.

A5-18

The EIR states that the project is consistent with, "Policy 2-23.2: Encourage architecture that disaggregates massive buildings into smaller parts with greater human scale," because the building has, "facades that would use color variation, glazing, and vertical articulation to allow for variation in mass and scale. The proposed warehouse would be approximately 55 feet in height from finished grade; materials used would include wall panels, concrete, galvalume metal roofing, and a glass curtain wall as well as various colors to reduce the overall sense of perceived mass." Concrete wall panels and vertical glass walls do not reduce mass. Their overall large size contributes to the increased perceived scale of the building due to the size of the singular material. Metal roofing on a 55 foot building would not be seen from the pedestrian scale and does not contribute to reduced massing. The EIR has not included substantial evidence to support a less than significant finding and a revised EIR must be prepared to include a finding of significance.

A5-19

The EIR states that the project is consistent with, "Policy 2-31.2: Promote sustainable building practices that go beyond the requirements of Title 24 of the California Administrative Code, and encourage energy-efficient design elements, as appropriate;" "Goal 2–32: Conserve energy resources;" and "Policy 2–32.1: Require the incorporation of energy conservation features into the design of all new construction and site development activities," because, "The Project would comply with Parts 6 and 11 of Title 24." As stated above in the Energy analysis, Title 24 Energy requirements are applicable plans and laws for energy efficiency in California. The State of California lists three approved compliance modeling softwares[19] for non-residential buildings: CBECC-Com, EnergyPro, and IES VE. The EIR utilizes CalEEMod and EFMAC as sources in its

A5-20

[19] California Energy Commission 2022 Energy Code Compliance Software https://www.energy.ca.gov/programs-and-topics/programs/building-energy-efficiency-standards/2022-building-energy-efficiency-1

methodology and analysis, which is clearly not an approved software. The modeling does not comply with the 2022 Building Energy Efficiency Standards and under-reports the project's significant Energy impacts and fuel consumption to the public and decision makers. The EIR has not analyzed the project in accordance with Title 24 Energy requirements, including providing an analysis of energy consumption utilizing one of the approved compliance modeling softwares for non-residential buildings. Therefore, it is unknown if the project conflicts with or obstructs an applicable state or local plan for renewable Energy or Energy efficiency. The EIR has not included substantial evidence to support a less than significant finding and a revised EIR must be prepared to include a finding of significance. A5-20

4.13 Population and Housing

The EIR utilizes uncertain and misleading language which does not provide any meaningful analysis of the project's population and employment generation. The EIR also relies upon the assumption that, "Given the high percentage of City residents commuting outside the City for employment and the opportunity to reduce local unemployment rates, the addition of new jobs as a result of the Project would likely be filled by the local labor market." The EIR does not include demographic information or other data supporting that the City's local unemployed population is qualified for or interested in work in the industrial sector. Ultimately relying on the entire labor force within the greater Inland Empire region to fill the project's construction and operational jobs will increase VMT and emissions during all phases of construction and operations and the EIR must be revised to account for longer worker trip distances. The revised EIR must also include a construction worker employment analysis in order to adequately and accurately analyze all potentially significant environmental impacts. A5-21

SCAG's Connect SoCal Demographics and Growth Forecast[20] notes that the City will add 4,300 jobs from 2019 - 2035. Utilizing the EIR's calculation of 557 employees, the project represents 13% of the City's employment growth from 2019 - 2035. A single project accounting for this amount of projected growth over 16 years represents a significant amount of growth. The EIR has not provided evidence that the growth generated by the proposed project was anticipated by the General Plan, RTP/SCS, or AQMP. A5-22

A revised EIR must also provide a cumulative analysis discussion of projects approved since 2019 (SCAG), the date of General Plan adoption, and projects "in the pipeline" to determine if the project will exceed SCAG's employment or population growth forecast for the City and/or the City's General Plan growth forecasts. For example, other recent projects such as 2830, 11190, 11258 S. Riverside Avenue Light Industrial (191 employees), Pepper Ave. SP Amendment and Development Project (717 employees), Birtcher Logistics (639 employees), Olive Ave. A5-23

[20] SCAG 2024 Connect SoCal Demographics and Growth Forecast
https://scag.ca.gov/sites/default/files/2024-05/23-2987-tr-demographics-growth-forecast-final-040424.pdf

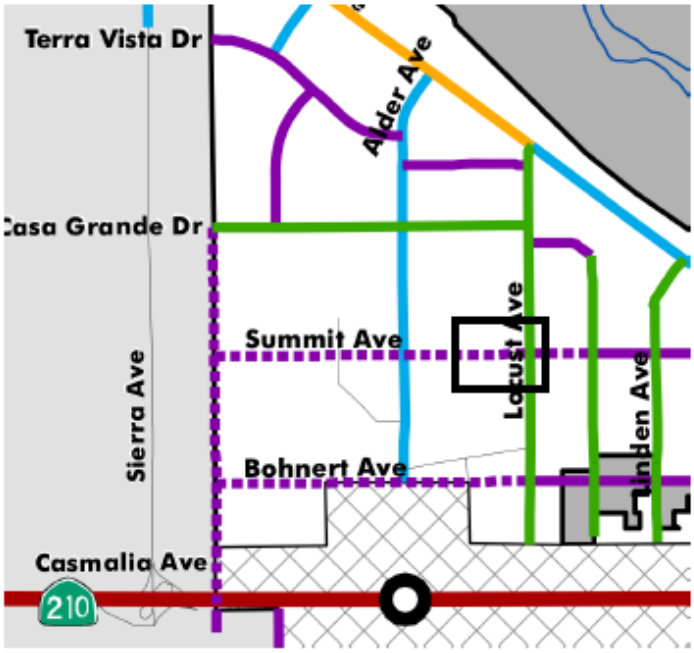
Daniel Casey
October 16, 2025
Page 11

Warehouse (575 employees), Durst Drive Warehouse (175 employees), 436 W. Rialto Ave (259 employees), Lilac/Santa Ana Warehouse (252 employees), 160 N. Cactus Ave Warehouse (138 employees), 2223/2271 Locust Ave. Warehouse (164 employees), 2720 S. Willow Avenue (104 employees), and Santa Ana Truck Terminal (140 employees) combined with the proposed project will cumulatively generate 3,911 employees, which is 91% of the City's employment growth forecast through 2035 accounted for only by recent industrial projects. These totals increase exponentially when commercial development and other industrial activity is added to the brief list of recent industrial activity above. A revised EIR must be prepared to include this information for analysis, and also provide a cumulative analysis discussion of projects approved since 2019 (SCAG), the date of General Plan adoption, and projects "in the pipeline" to determine the City's progress towards General Plan buildout capacity and SCAG's growth forecasts.

A5-23

4.15 Transportation

The EIR states that, "The Project's circulation plan would be consistent with the General Plan pertaining to transit, bicycle and pedestrian facilities." The EIR does not analyze the project in accordance with the City's Circulation Map. Exhibit 4.1 – Street Classifications within Circulation Element[21] depicts Summit Avenue bisecting the project site through to Locust Avenue. The dashed purple lines on Exhibit 4.1 indicate that Summit Avenue is a planned Collector Street within the project site.



A5-24

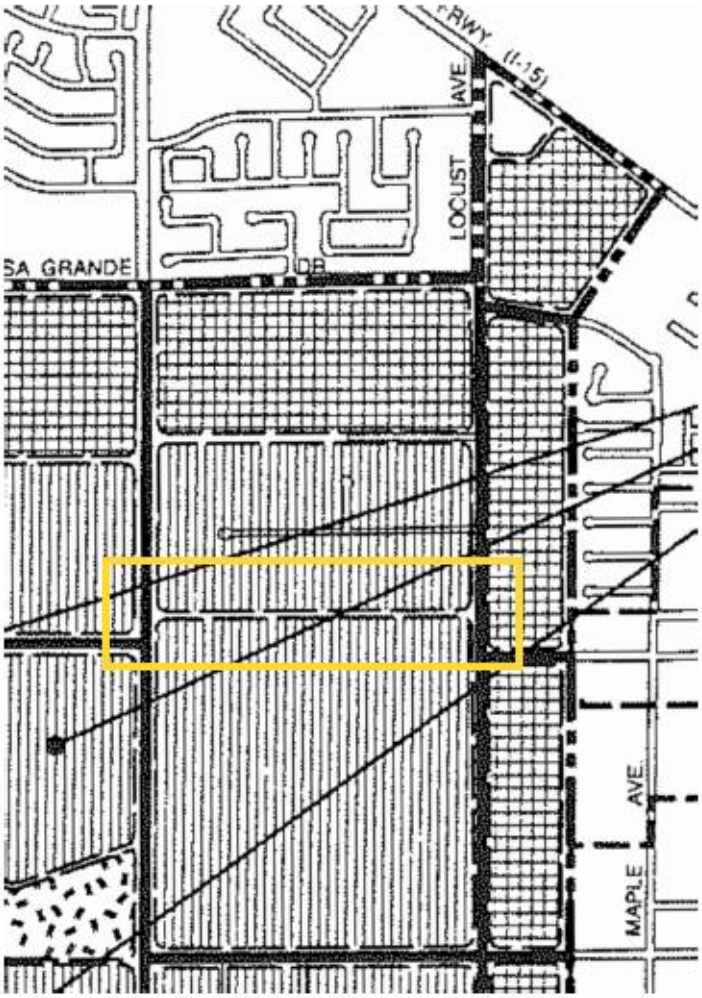
[21] https://rialto.legistar.com/View.ashx?M=F&ID=13534008&GUID=4121DE7B-2AD0-4630-A8E7-A17195FDDD99

Daniel Casey
October 16, 2025
Page 12

A5-24

Exhibit 3: Land Use Plan within the Rialto Airport Specific Plan also depicts Summit Avenue bisecting the project site.

Daniel Casey
October 16, 2025
Page 13



A5-24

The Project conflicts with Exhibit 4.1 - Street Classifications within the Circulation Element and Exhibit 3: Land Use Plan within the Rialto Airport Specific Plan, which are plans and policies addressing the circulation system. A General Plan Amendment is required to remove the planned extension of Summit Avenue through the project site from Exhibit 4.1 - Street Classifications within the Circulation Element. A Specific Plan Amendment is required to remove the planned extension of Summit Avenue through the project site from Exhibit 3: Land Use Plan within the Rialto Airport Specific Plan. The project has not applied for these entitlements and the EIR does not address the planned extension of Summit Avenue. The project conflicts with these plans and policies addressing the circulation system, and therefore a finding of significance is required as part of a revised EIR.

Additionally, this section of the EIR has not addressed the following Circulation Element policies:

1. Policy 4-1.20: Design City streets so that signalized intersections operate at Level of Service (LOS) D or better during the morning and evening peak hours, and require new development to mitigate traffic impacts that degrade LOS below that level.
2. Policy 4-1.21: Design City streets so that unsignalized intersections operate with no vehicular movement having an average delay greater than 120 seconds during the morning and evening peak hours, and require new development to mitigate traffic impacts that increase delay above that level.

A5-25

The Land Use and Planning section stated that, "LOS is not used under CEQA to evaluate traffic impacts." It is a commonly perpetuated misconception that when the State added VMT as a required analysis under CEQA, it removed any need for LOS analysis. The threshold of significance poses the question whether the project conflicts with plans and policies addressing the circulation system. The City has adopted policies with LOS requirements for signalized intersections and delay requirements for unsignalized intersections, both of which are components of the circulation system. Therefore, an LOS analysis is required. The EIR has not provided a LOS analysis or any substantial evidence to support a less than significant finding, and therefore a finding of significance is required in a revised EIR.

The City's Traffic Impact Analysis Guidelines for Vehicle Miles Traveled (VMT) and Level of Service Assessment (LOS)[22] (City Guidelines) state, "To avoid unnecessary delays or revisions and to streamline the TIA preparation and review process, the City requires applicant to submit a Project Scoping Agreement to the City Planning Department. Even if a Project is exempt from level of service analysis, the Project Scoping must provide proposed VMT analysis or document screening criteria." The EIR has not provided the Project Scoping Agreement as an attachment for public review. Incorporation by reference (CEQA § 15150 (f)) is not appropriate as the Project Scoping Agreement contributes directly to analysis of the problem at hand. The EIR must be revised to include the Project Scoping Agreement for public review and comment.

A5-26

Appendix J: VMT Analysis has underreported the quantity of VMT generated by the proposed project operations. Table 1 – Project SED Model Inputs within Appendix J states that 246 employees were analyzed for VMT generation, and a methodology for determining this quantity of employees is not provided. This conflicts with the Population and Housing analysis that states the project will generate 557 operational employees utilizing the employment generation ratios from SCAG's Employment Density Study. The EIR must be revised to analyze the project's VMT

A5-27

[22] https://rialto.legistar.com/View.ashx?M=F&ID=11079844&GUID=534A81D0-0C1D-4A51-9B71-3368ABC01F41

generated by 557 operational employees in order to provide an adequate and accurate environmental analysis. A5-27

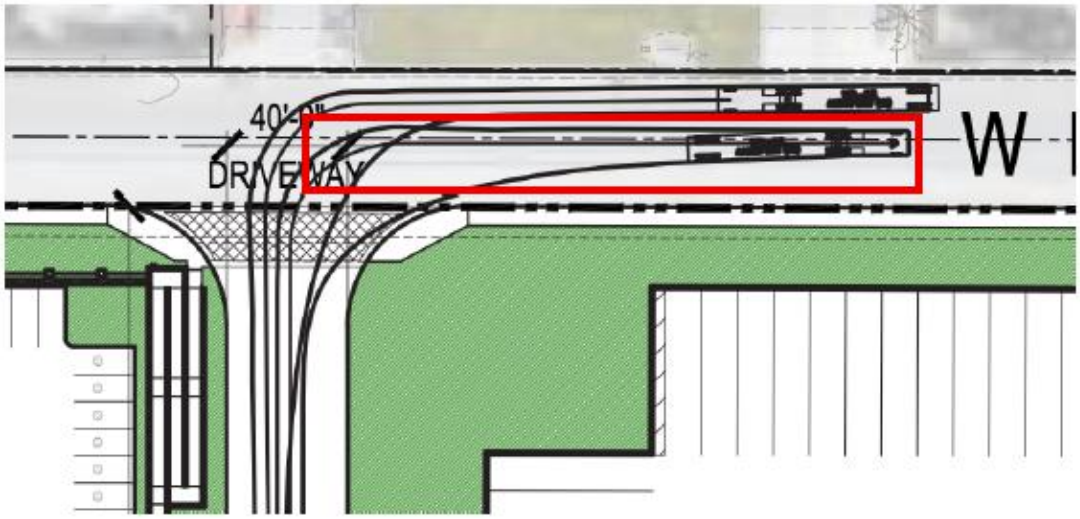
Additionally, the operational nature of industrial/warehouse uses involves high rates of truck/trailer/delivery van VMT due to traveling from large import hubs to regional distribution centers to smaller industrial parks and then to their final delivery destinations. Once employees arrive at work at the proposed project, they will conduct their jobs by driving delivery vans across the region as part of the daily operations as a fulfillment center warehouse, which will drastically increase project-generated VMT. The project's truck/trailer and delivery van activity is unable to utilize public transit or active transportation and it is misleading to the public and decision makers to exclude this activity from VMT analysis. The project's total operational VMT generated is further inconsistent with the significance threshold and legislative intent of SB 743 to reduce greenhouse gas emissions by reducing VMT. A revised EIR must be prepared to reflect a quantified VMT analysis that includes all truck/trailer and delivery van activity. A5-28

Appendix J also excludes modeling input parameters and output screens generated by the SBTAM model to support the EIR's analysis. This does not comply with CEQA's requirements for adequate informational documents and meaningful disclosure (CEQA § 15121 and PRC 21003(b)). The VMT input/output modeling information contributes directly to analysis of the problem at hand and cannot be incorporated by reference (CEQA § 15150 (f)). A revised EIR must be prepared to include these items for review by the public and decision makers in order to provide an adequate informational document. A5-29

The EIR has not adequately analyzed the project's potential to substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses; or the project's potential to result in inadequate emergency access.

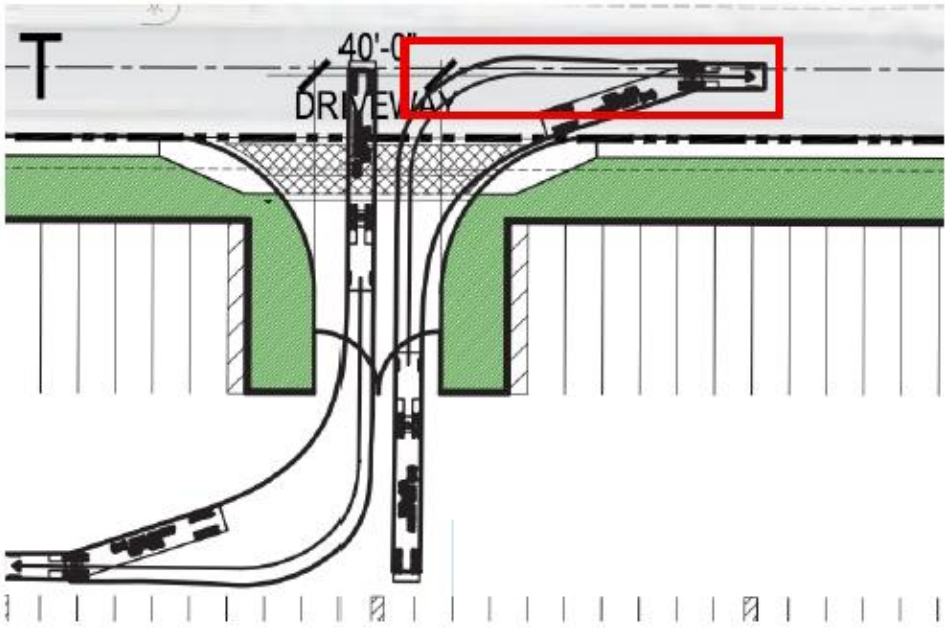
Figure 3-5: Conceptual Truck Circulation Plan depicts several areas of conflict between vehicles. For example, trucks are modeled exiting the site via the central and eastern driveways on Lowell Street. They require additional maneuvering space across the centerline of each street, meaning that the trucks will need to drive on the "wrong side" of the street into oncoming traffic in order to leave the site. A5-30

Daniel Casey
October 16, 2025
Page 16



Additionally, the overlapping lines along the internal driveway indicate that it is not wide enough to accommodate more than one truck/trailer. Queuing/storage space is required on Lowell Street and the EIR has not analyzed these significant impacts. A finding of significance is required in a revised EIR.

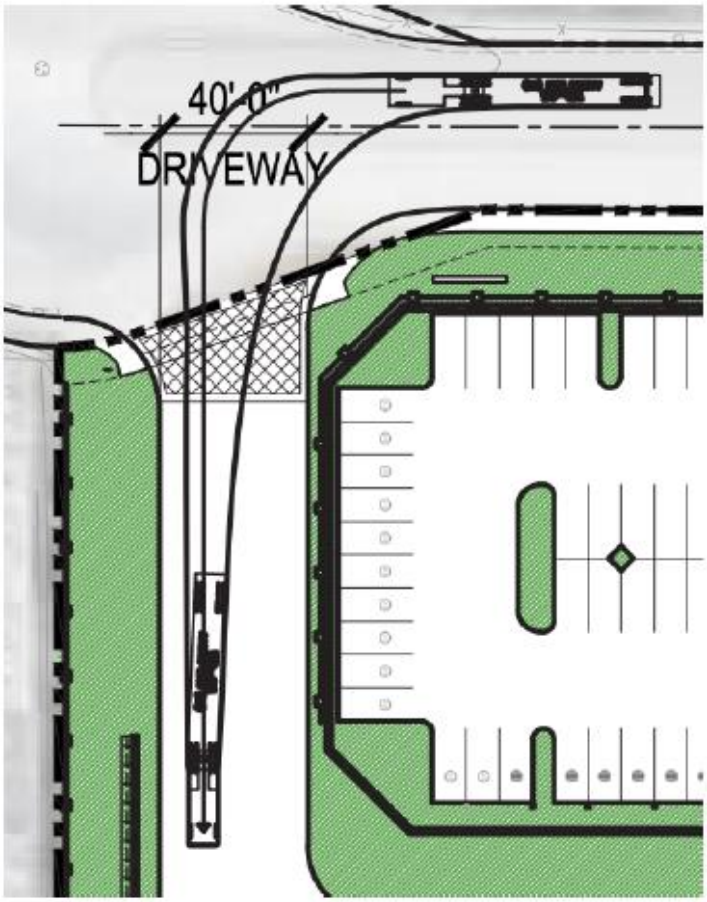
A5-30



Daniel Casey
October 16, 2025
Page 17

Further, the truck/trailer entering the site via the easterly driveway on Lowell Street is not modeled to execute the full turning maneuver. The modeling must be updated to depict the truck/trailer entering the site conducting a full turning maneuver in order to provide an adequate and accurate environmental analysis.

The truck/trailer modeling at the westerly driveway on Lowell Street and the driveway on Locust Avenue only depicts trucks/trailers entering the site. It does not model trucks/trailers simultaneously exiting and entering the site at these access points, meaning that there is not enough space to accommodate full truck maneuvering. The modeling must be updated to depict trucks/trailers simultaneously exiting and entering the site.



A5-31

A5-31

It is also not possible to discern the size of the truck/trailer utilized for modeling throughout Figure 3-5. The EIR must be revised to model a WB-67 truck (a standard 72 feet in length) maneuvering throughout the site and accessing the site at all vehicular access points in order to provide an adequate, accurate environmental analysis and worst-case scenario modeling.

The EIR states that, "The limited-use area for each driveway would be kept clear of visual obstructions, including signage, structures, and obstructive landscaping, in order to maintain adequate sight distance. The Project would be designed in compliance with all applicable State building codes and would meet City standards for design, including sight distance at intersections. Therefore, impacts are considered less than significant and no mitigation is required." However, this does not account for street parking on any public street adjacent to the project site, and other typical visual obstructions beyond the immediate limited-use areas adjacent to project driveways. A revised EIR must be prepared to include a sight distance analysis based on the American Association of State Highway and Transportation Officials (AASHTO) Stopping Sight Distance requirements in oder to provide an adequate and accurate environmental analysis.

A5-32

5.4 Growth-Inducing Effects

The EIR does not discuss or analyze the project's compliance with the General Plan's Land Use buildout scenario. Table 2-3: Land Use Build Out of the Updated Rialto General Plan Land Use

A5-33

Element[23] states that the General Industrial designation supports the development of 17,181,000 sf of industrial space through the document's 2040 horizon year. The project's proposed 664,859 sf of industrial space is 3.8% of the total industrial space permitted over the 30 year General Plan period, which represents a significant amount of growth attributed to a single project. The EIR also does not discuss or analyze the project's compliance with the Rialto Airport Specific Plan buildout scenario. A revised EIR must be prepared to include all of the above-stated analysis in order to provide an adequate informational document.

A5-33

As noted throughout this comment letter, the project represents a significant amount of growth in the City and accounts for a significant amount of the City's employment growth over 16 years (SCAG) and through the City's General Plan horizon year of 2040. The EIR has not provided an adequate or accurate cumulative analysis discussion here to demonstrate the impact of the proposed project in a cumulative setting. SCAG's Connect SoCal Demographics and Growth Forecast[24] notes that the City will add 4,300 jobs from 2019 - 2035. Utilizing the EIR's calculation of 557 employees, the project represents 13% of the City's employment growth from 2019 - 2035. A single project accounting for this amount of projected growth over 16 years represents a significant amount of growth. The EIR has not provided evidence that the growth generated by the proposed project was anticipated by the General Plan, RTP/SCS, or AQMP.

A revised EIR must also provide a cumulative analysis discussion of projects approved since 2019 (SCAG), the date of General Plan adoption, and projects "in the pipeline" to determine if the project will exceed SCAG's employment or population growth forecast for the City and/or the City's General Plan growth forecasts. For example, other recent projects such as 2830, 11190, 11258 S. Riverside Avenue Light Industrial (191 employees), Pepper Ave. SP Amendment and Development Project (717 employees), Birtcher Logistics (639 employees), Olive Ave. Warehouse (575 employees), Durst Drive Warehouse (175 employees), 436 W. Rialto Ave (259 employees), Lilac/Santa Ana Warehouse (252 employees), 160 N. Cactus Ave Warehouse (138 employees), 2223/2271 Locust Ave. Warehouse (164 employees), 2720 S. Willow Avenue (104 employees), and Santa Ana Truck Terminal (140 employees) combined with the proposed project will cumulatively generate 3,911 employees, which is 91% of the City's employment growth forecast through 2035 accounted for only by recent industrial projects. These totals increase exponentially when commercial development and other industrial activity is added to the brief list of recent industrial activity above. A revised EIR must be prepared to include this information for analysis, and also provide a cumulative analysis discussion of projects approved since 2019

(SCAG), the date of General Plan adoption, and projects "in the pipeline" to determine the City's progress towards General Plan buildout capacity and SCAG's growth forecasts.

A5-34

Impact on Biological Resources
Please see the attached comments and analysis from Dr. Smallwood.

A5-35

Conclusion
For the foregoing reasons, GSEJA believes the EIR is flawed and a revised EIR must be prepared for the proposed project and circulated for public review. Golden State Environmental Justice Alliance requests to be added to the public interest list regarding any subsequent environmental documents, public notices, public hearings, and notices of determination for this project. Send all communications to Golden State Environmental Justice Alliance P.O. Box 79222 Corona, CA 92877.

Subject: Comments on the Locust Gateway Development Project (SCH No. 2024061274)

Dear Mr. Ho,

We have reviewed the September 2025 Draft Environmental Impact Report ("DEIR") for the Locust Gateway Development Project ("Project") located in the City of Rialto ("City"). The Project proposes to construct a 664,859-square-foot ("SF") warehouse, including 7,713-SF of office space, and 365 parking spaces on the 40-acre site.

Our review concludes that the DEIR fails to adequately evaluate the Project's air quality, health risk, and greenhouse gas impacts. As a result, emissions and health risk impacts associated with construction and operation of the proposed Project may be underestimated and inadequately addressed. A revised Environmental Impact Report ("EIR") should be prepared to adequately assess and mitigate the air quality, health risk, and greenhouse gas impacts that the project may have on the environment. A5-37

Air Quality

Unsubstantiated Input Parameters Used to Estimate Project Emissions

When reviewing the Project's CalEEMod output files, provided in the Air Quality, Energy, and Greenhouse Gas Data ("AQ Report") provided as Appendix B to the DEIR, we identified several model inputs related to Project construction that are inconsistent with information disclosed in the DEIR. A revised EIR be prepared to include an updated air quality analysis that provides a more detailed evaluation of the impact that construction and operation of the Project may have on local and regional air quality. A5-38

Unsubstantiated Changes to Individual Construction Phase Lengths

Review of the CalEEMod output files demonstrates that the "Locust Gateway Development Project_Unmitigated Detailed Report" and the "Locust Gateway Development Project_Mitigated A5-39

Detailed Report" models include changes to the default construction schedule (see screenshot below) (Appendix B, pp. 55, 140).

8. User Changes to Default Data

Screen	Justification
Land Use	Per site plans and PD.
Construction: Construction Phases	Per construction questionnaire.
Construction: Off-Road Equipment	Per construction questionnaire.
Operations: Vehicle Data	Warehouse = Trucks Parking Lot = Passenger Cars
Operations: Fleet Mix	Warehouse = Trucks Parking Lot = Passenger Cars
Operations: Energy Use	Electricity consumption per Applicant.
Construction: Dust From Material Movement	Anticipated import.

As a result of these changes, the models include the following construction schedule (see excerpt below) (Appendix B, pp. 42, 122):

Phase Name	Phase Type	Start Date	End Date	Days Per Week	Work Days per Phase	Phase Description
Demolition	Demolition	8/1/2025	8/28/2025	5.00	20.0	—
Site Preparation	Site Preparation	8/29/2025	9/25/2025	5.00	20.0	—
Grading	Grading	9/26/2025	1/15/2026	5.00	80.0	—
Building Construction	Building Construction	1/16/2026	9/1/2026	5.00	163	—
Paving	Paving	9/2/2026	9/29/2026	5.00	20.0	—
Architectural Coating	Architectural Coating	9/1/2026	12/30/2026	5.00	87.0	—
Infrastructure Improvements	Trenching	12/1/2026	12/30/2026	5.00	22.0	—

A5-39

The CalEEMod User's Guide requires any changes to model defaults be justified.[1] The justification provided for these changes is:

> "Per construction questionnaire" (Appendix B, pp. 55, 140).

Regarding the Project's construction schedule, the DEIR states:

> "For the purpose of this CEQA analysis, Project construction is expected to commence in 2025 with a construction duration of approximately 15 months and would be completed in one phase" (p. 3-14).

Additionally, the AQ Report includes a breakdown of their CalEEMod assumptions and includes the following table (see excerpt below) (Appendix B, pp. 2).

[1] "CalEEMod User Guide." CAPCOA, April 2022, available at: https://www.caleemod.com/documents/user-guide/01_User%20Guide.pdf, p. 13, 14.

2

Construction

Schedule

Phase Name	Start Date	End Date	Workdays
Demolition	8/1/2025	8/28/2025	20
Site Preparation	8/29/2025	9/25/2025	20
Grading	9/26/2025	1/15/2026	80
Building Construction	1/16/2026	9/1/2026	163
Paving	9/2/2026	9/29/2026	20
Architectural Coating	9/1/2026	12/30/2026	87
Infrastructure Improvements	12/1/2026	12/30/2026	22

However, the construction schedule included in the model remains unsupported for two reasons.

A5-39

First, the AQ Report indicates that construction schedule presents the *assumed* construction schedule included in the model and, thus, reflects the modeling parameters, not the actual construction schedule anticipated on the site. Second, although the DEIR justifies a total construction duration of 15 months, the provided table does not adequately substantiate the individual construction phase lengths. The construction schedule—and any changes in the CalEEMod model—should be provided by the Project Applicant. According to the CalEEMod User's Guide:

> "CalEEMod was also designed to allow the user to change the defaults to reflect site- or project-specific information, when available, provided that the information is supported by substantial evidence as required by CEQA." [2]

Here, as the Project documents fail to provide substantial evidence or a verifiable source to support the revised individual construction phase lengths, we cannot verify the changes.

These unsubstantiated changes present an issue, as construction emissions may be unevenly distributed, with some phases extended over longer periods. According to the CalEEMod User's Guide, each construction phase is associated with different emissions activities (see excerpt below).[3]

A5-40

[2] "CalEEMod User Guide." CAPCOA, April 2022, available at: https://www.caleemod.com/documents/user-guide/01_User%20Guide.pdf, p. 10.
[3] "CalEEMod User Guide." CAPCOA, April 2022, available at: https://www.caleemod.com/documents/user-guide/01_User%20Guide.pdf, p. 34, Table 3.

3

Table 3. CalEEMod Default Construction Phases [a]

Phase Type	Description
NON-LINEAR LAND USE TYPES (VERTICAL CONSTRUCTION)	
Demolition	Involves removing buildings or structures.
Site Preparation	Involves clearing vegetation (grubbing and tree/stump removal) and removing stones and other unwanted material or debris prior to grading.
Grading	Involves the cut and fill of land to ensure that the proper base and slope is created for the foundation.
Building Construction	Involves the construction of the foundation, structures, and buildings.
Paving	Involves the laying of concrete or asphalt such as in parking lots, roads, driveways, or sidewalks.
Architectural Coating	Involves the application of coatings to both the interior and exterior of buildings or structures, the painting of parking lot or parking garage striping, associated signage and curbs, and the painting of the walls or other components such as stair railings inside parking structures.

A5-40

By modifying the individual construction phase lengths, the models assume there are more days to complete the construction activities required by the certain phases. The models therefore assume fewer activities would be required per day for those phases and, consequently, less pollutants emitted per day. Thus, the models may underestimate the peak daily emissions associated with certain construction activities. The models should have instead proportionately altered all phase lengths to match the proposed construction duration of 15 months.

Unsubstantiated Amount of Required Demolition

Regarding demolition required for Project construction, the DEIR simply indicates that "Project implementation would include removal of existing on-site vegetation and building remnants" (p. 1-1).

Review of the CalEEMod output files demonstrates that the "Locust Gateway Development Project_Unmitigated Detailed Report" and the "Locust Gateway Development Project_Mitigated Detailed Report" models include 4,750-SF of demolition debris (Appendix B, pp. 45, 128).

Phase Name	Material Imported (Cubic Yards)	Material Exported (Cubic Yards)	Acres Graded (acres)	Material Demolished (Building Square Footage)	Acres Paved (acres)
Demolition	0.00	0.00	0.00	4,750	—
Site Preparation	0.00	0.00	30.0	0.00	—
Grading	30,000	0.00	240	0.00	—
Paving	0.00	0.00	0.00	0.00	20.9

A5-41

However, the DEIR does not disclose the specific square footage of buildings to be demolished, or the tons of demolition debris estimated to be generated during Project construction. Therefore, the amount of demolition material inputted into the models may be underestimated and we cannot verify that only 4,750-SF of material demolished would be generated during Project construction.

This presents an issue, as demolition material is used to calculate emissions associated with fugitive dust, debris removal, as well as exhaust from hauling trucks traveling to and from the Project site.[4] By

[4] "CalEEMod User Guide." CAPCOA, April 2022, available at: https://www.caleemod.com/documents/user-guide/01_User%20Guide.pdf, p. 38.

4

including an unsubstantiated amount of demolition, the models may underestimate the Project's construction-related emissions and should not be relied upon to determine Project significance. A5-41

Disproportionate Health Risk Impacts of Warehouses on Surrounding Communities

The development of the proposed Project may contribute to the disproportionate health risk impact that warehouses already pose on community members living, working, and going to school within the immediate area of the Project site. According to the SCAQMD, communities of color living within a half mile of warehouses face higher health risks, including increased rates of asthma and heart attacks, along with a greater environmental burden.[5]

Specifically, the SCAQMD found that more than 2.4 million people live within a half mile radius of at least one warehouse, and that those areas not only experience increased rates of asthma and heart attacks, but are also disproportionately Black and Latino communities below the poverty line.[6] Another study indicates "neighborhoods with lower household income levels and higher percentages of minorities are expected to have higher probabilities of containing warehousing facilities."[7] Furthermore, a report authored by the Inland Empire-based People's Collective for Environmental Justice and University of Redlands explains that the warehouse and logistics industry is expanding rapidly, with many new projects being built in low-income communities of color. These projects attract high volumes of polluting truck traffic, which emits harmful nitrogen oxide and particulate matter, contributing to severe health issues like asthma, COPD, cancer, and premature death.[8] Despite these public health impacts, warehouse development continues to accelerate, with the Inland Empire adding 10 to 25 million square feet of new industrial space annually.[9] A5-42

When using CalEnviroScreen 4.0, CalEPA's screening tool that ranks each census tract in the State for pollution and socioeconomic vulnerability, we found that the Project's census tract is in the 80th percentile of most polluted census tracts in the State (see screenshot below).[10] A5-43

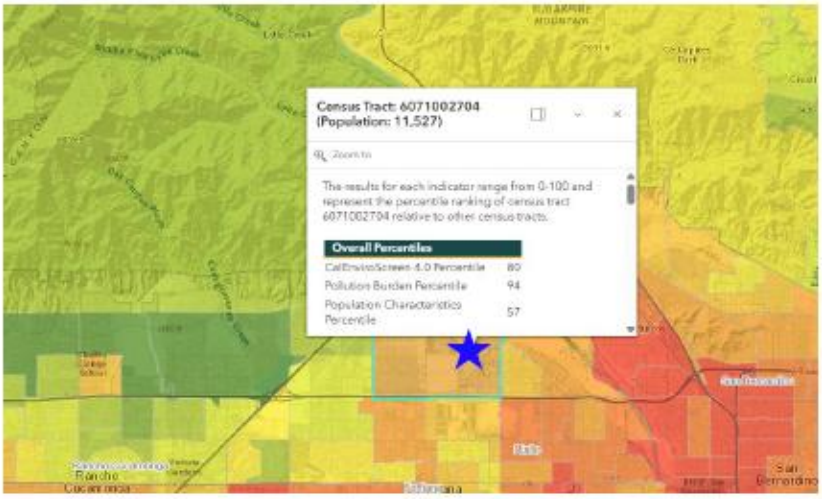
5



The Data Visualization Tool for Mates V, a monitoring and evaluation study conducted by SCAQMD, demonstrates that the County already exhibits a heightened residential carcinogenic risk from exposure to air toxics.[11] Specifically, the location of the Project site is in the 78th percentile of highest cancer risks in the South Coast Air Basin ("SCAB"), with a cancer risk of 436 in one million (see screenshot below).[12]

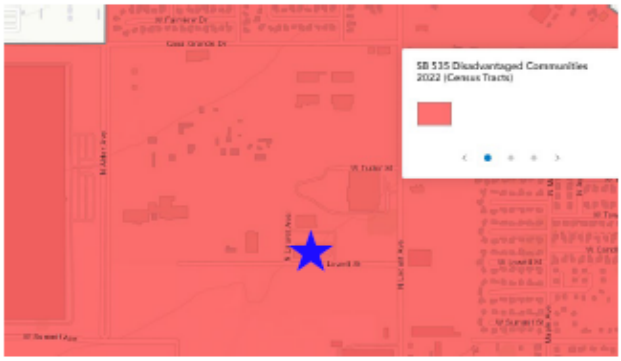
6

Additionally, according to CalEnviroScreen's Senate Bill ("SB") 535 Disadvantaged Communities Map, the Project site is identified as a designated disadvantaged community (see screenshot below).[13]



A5-44

SB 535 provides funding for development projects that provide a benefit to disadvantaged communities. CalEPA has been given the responsibility for identifying those communities based on "geographic, socioeconomic, public health, and environmental hazard criteria."[14] The Project may therefore worsen disproportionate health risks for community members within the immediate area, a concern underscored by the mandates of SB 1000. SB 1000, enacted to address environmental justice concerns, requires local governments to integrate environmental justice elements into their planning processes, particularly focusing on reducing health risks for disadvantaged communities.[15] As the DEIR indicates that the proposed Project site is located approximately 700 feet away from residential receptors (p. 4.2-28), the Project should comply with the objectives of SB 1000.

In accordance with the California Department of Justice ("CA DOJ") guidelines, the effects of greenhouse gas emissions and air pollutants from warehouses should be evaluated cumulatively. The CA DOJ states that cumulative impacts should be evaluated by considering the project's incremental effects alongside past, present, and future projects, even if the project alone does not exceed significance thresholds.[16] To more adequately assess the Project's impact on disadvantaged communities, both existing and future warehouse developments should be considered during the environmental review process.

A5-45

[13] "SB 535 Disadvantaged Communities (2022 Update)." California Environmental Protection Agency, *available at:* https://experience.arcgis.com/experience/1c21c53da8de48f1b946f3402fbae55c/page/SB-535-Disadvantaged-Communities/

[14] "Final Designation of Disadvantaged Communities." CalEPA, *available at:* https://calepa.ca.gov/wp-content/uploads/2022/05/Updated-Disadvantaged-Communities-Designation-DAC-May-2022-Eng.a.hp_-1.pdf, p. 1.

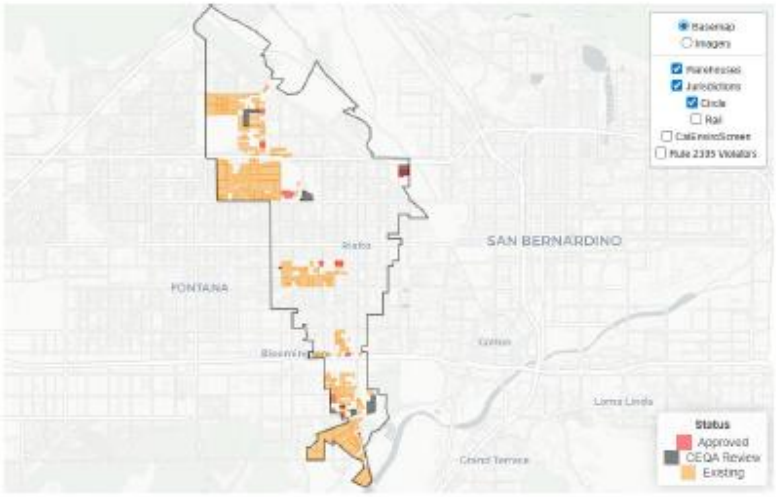
[15] "Environmental Justice in Local Land Use Planning." CA DOJ, *available at:* https://oag.ca.gov/environment/sb1000.

[16] "Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act." CA DOJ, available at: https://oag.ca.gov/sites/all/files/agweb/pdfs/environment/warehouse-best-practices.pdf, p. 6.

7

As the Project site is in an SB 535 disadvantaged community that experiences disproportionately high levels of pollution, we recommend reevaluating the Project's cumulative health risks to more sufficiently align with CA DOJ guidelines and SB 1000 environmental justice requirements.

The Warehouse Cumulative Impact Tool for Community dashboard ("Warehouse CITY"), developed by the Redford Conservancy at Pitzer College and Radical Research LLC, is a tool that visualizes and quantifies existing, potential, and approved warehouse locations across Southern California. Review of Warehouse CITY reveals that there are 197 existing warehouses currently in Rialto, 10 more that have been approved, and 7 that are currently under CEQA review (see screenshot below).[17]



A5-46

The presence of numerous existing warehouses in the City underscores the need to reassess the Project's cumulative health risks pursuant to CA DOJ guidelines and SB 1000 environmental justice requirements.

Diesel Particulate Matter Emissions Inadequately Evaluated

The DEIR conducts a health risk analysis ("HRA") evaluating impacts as a result of exposure to diesel particulate matter ("DPM") emissions from Project construction and operation. Specifically, the DEIR estimates that the maximum cancer risk posed to nearby, existing residential sensitive receptors as a result of Project construction and operation would be 1.41 in one million (p. 4.2-29). However, the DEIR's evaluation of the Project's potential health risk impacts, as well as the subsequent less-than-significant impact conclusion, is unsupported.

A5-47

The equation used to calculate the Project's construction-related and operational cancer risks is incorrect as it does not account for Age Sensitivity Factors ("ASF"). According to the *Risk Assessment*

[17] "Warehouse and Air Quality Mapping." Pitzer College & Radical Research LLC, *available at*: https://radicalresearch.shinyapps.io/WarehouseCITY/.

8

Guidelines provided by the Office of Environmental Health Hazard Assessment ("OEHHA"), the following ASF factors should be used when calculating cancer risks for different age groups:[18]

Age Group	Age Sensitivity Factor (unitless)
3rd Trimester	10
0<2 years	10
2<9 years	3
2<16 years	3
16<30 years	1
16-70 years	1

However, the DEIR's HRA uses the following equation (see screenshot below) (Appendix C, p. 25):

$$Risk_{inh\text{-}res} = (Dose_{air}*CPF*(ED/AT)*FAH)$$

$Risk_{inh\text{-}res}$ =	residential inhalation cancer risk (potential chances per million)
$Dose_{air}$ =	daily dose through inhalation (mg/kg-day)
CPF =	inhalation cancer potency factor ($mg/kg\text{-}day^{-1}$)
ED =	exposure duration (years)
AT =	averaging time of lifetime cancer risk (years)
FAH =	fraction of time spent at home (unitless)

A5-47

As demonstrated above, the equation used for the DEIR's HRA does not include ASFs. Instead, per OEHHA guidance, the DEIR should have used the following equation:[19]

A. Equation 8.2.4 A: $RISK_{inh\text{-}res} = DOSE_{air} \times CPF \times ASF \times ED/AT \times FAH$

7. $RISK_{inh\text{-}res}$ = Residential inhalation cancer risk
8. $DOSE_{air}$ = Daily inhalation dose (mg/kg-day)
9. CPF = Inhalation cancer potency factor ($mg/kg\text{-}day^{-1}$)
10. ASF = Age sensitivity factor for a specified age group (unitless)
11. ED = Exposure duration (in years) for a specified age group
12. AT = Averaging time for lifetime cancer risk (years)
13. FAH = Fraction of time spent at home (unitless)

By not including ASF values, the DEIR's HRA underestimates the cancer risk posed to nearby, existing sensitive receptors as a result of Project construction and operation. As such, a revised EIR should be prepared to include an updated analysis correctly accounting for ASF values.

[18] "Risk Assessment Guidelines Guidance Manual for Preparation of Health Risk Assessments." OEHHA, February 2015, available at: https://oehha.ca.gov/media/downloads/crnr/2015guidancemanual.pdf, p. 8-5 Table 8.3.
[19] "Risk Assessment Guidelines Guidance Manual for Preparation of Health Risk Assessments." OEHHA, February 2015, available at: https://oehha.ca.gov/media/downloads/crnr/2015guidancemanual.pdf, p. 8-7 Equation 8.2.4.

9

Greenhouse Gas

Failure to Adequately Evaluate Greenhouse Gas Impacts

The DEIR estimates that the Project would result in mitigated net annual greenhouse gas ("GHG") emissions of 10,172-metric tons of carbon dioxide equivalents per year ("MT CO_2e/year") (see screenshot below) (p. 4.7-19, Table 4.7-3).

Table 4.7-3: Project Greenhouse Gas Emissions

Emissions Source	$MTCO_2e$ per Year	
	Unmitigated	Mitigated
Area and Indirect Sources		
Construction Amortized Over 30 Years	44	44
Area Source[1]	14	0
Energy – Electricity[2]	229	5
Energy – Natural Gas[3]	674	0
Off-road – Yard Trucks[4]	111	35
Off-Road – Forklifts[4]	354	112
Emergency Backup Generator	8	8
Waste[5]	196	49
Water and Wastewater[6]	467	421
Mobile Sources		
Trucks	8,029	8,029
Passenger Cars[7]	1,469	1,469
Total	***11,596***	***10,172***
Threshold	*3,000*	*3,000*
Exceeds Threshold?	**Yes**	**Yes**

1. Mitigation Measure (MM) AQ-3 requires 100 percent electric landscaping equipment, which would reduce area source emissions.
2. MM GHG-1 requires renewable energy to offset energy emissions and MM GHG-2 requires buildings to meet or exceed CALGreen Tier 2 standards.
3. MM AQ-2 requires the Project to use all-electric appliances, and end uses instead of natural gas, as well as prohibits installation of natural gas utility lines or connections (refer to **Section 4.2: Air Quality**).
4. MM AQ-5 requires outdoor cargo handling equipment to be zero emissions or alternatively fueled (refer to **Section 4.2: Air Quality**).
5. MM GHG-3 requires the Project to divert 75 percent of waste from landfills.
6. MM GHG-4 requires to implement a Water Use Efficiency and Conservation Plan.
7. MM AQ-4 requires the implementation of a Transportation Demand Management (TDM) program to reduce single-occupant vehicle trips and encourage public transit (refer to **Section 4.2: Air Quality**). However, emission reductions associated with MM AQ-4 were conservatively not included in this table.

Source: CalEEMod version 2022.1. Refer to **Appendix B** for model outputs.

A5-48

The DEIR subsequently concludes that the Project would result in a significant-and-unavoidable GHG impact, stating:

> "As shown in Table 4.7-3, mitigated GHG emissions would exceed the 3,000 $MTCO_2e$ per year threshold despite implementation of all feasible mitigation. Therefore, project-related GHG emissions would be significant and unavoidable" (p. 4.7-21).

The DEIR implements Mitigation Measure ("MM") GHG-1 – MM GHG-4 (p. 1-24 – 1-26). However, while we agree that the Project would result in a significant GHG impact, the DEIR's assertion that this impact is significant-and-unavoidable is incorrect, as additional feasible mitigation is available. According to CEQA Guidelines §15096(g)(2):

> "When an updated EIR has been prepared for a project, the Responsible Agency shall not approve the project as proposed if the agency finds any feasible alternative or feasible

10

mitigation measures within its powers that would substantially lessen or avoid any significant effect the project would have on the environment."[20]

As such, the DEIR is required under CEQA to implement all feasible mitigation to reduce impacts to a less-than-significant level. To reduce the Project's GHG impacts to the maximum extent possible, additional mitigation measures should be incorporated, such as those suggested in the section of this letter titled "Feasible Mitigation Measures Available to Reduce Emissions." The Project should not be approved until a revised EIR is prepared, incorporating all feasible mitigation to reduce emissions to less-than-significant levels if feasible. A5-48

Mitigation

Feasible Mitigation Measures Available to Reduce Emissions

The DEIR is required under CEQA to implement all feasible mitigation to reduce the Project's potential impacts. As demonstrated above, the Project would result in a significant greenhouse gas impact that should be mitigated further.

To reduce the GHG emissions associated with the Project, we recommend several mitigation measures listed below. The CA DOJ recommends: [21]

- Oversizing electrical rooms by 25 percent or providing a secondary electrical room to accommodate future expansion of electric vehicle charging capability.
- Requiring all stand-by emergency generators to be powered by a non-diesel fuel. A5-49
- Designing to LEED green building certification standards.
- Constructing zero-emission truck charging/fueling stations proportional to the number of dock doors at the project.
- Running conduit to designated locations for future electric truck charging stations.
- Constructing and maintaining electric light-duty vehicle charging stations proportional to the number of employee parking spaces.
- Running conduit to an additional proportion of employee parking spaces for a future increase in the number of electric light-duty charging stations.
- Requiring facility operators to train managers and employees on efficient scheduling and load management to eliminate unnecessary queuing and idling of trucks.
- Requiring that every tenant train its staff in charge of keeping vehicle records in diesel technologies and compliance with CARB regulations, by attending CARB-approved courses. Also

require facility operators to maintain records on-site demonstrating compliance and make records available for inspection by the local jurisdiction, air district, and state upon request.

- Requiring tenants to enroll in the United States Environmental Protection Agency's SmartWay program, and requiring tenants who own, operate, or hire trucking carriers with more than 100 trucks to use carriers that are SmartWay carriers.
- Providing tenants with information on incentive programs, such as the Carl Moyer Program and Voucher Incentive Program, to upgrade their fleets.

SCAQMD staff recommends: [22]

- Using light-colored paving and roofing materials.
- Utilizing only Energy Star heating, cooling, and lighting devices and appliances.

A5-49

CEQA Guidelines 15126.4 (c)(3) include "[o]ffsite measures, including offsets that are not otherwise required, to mitigate a project's emissions" as an option for GHG mitigation.[23] An example of this was in the case of the Oakland Sports and Mixed-Use Project, where off-site reduction measures in the neighboring communities were recommended.[24] We recommend consideration of local carbon offset programs to reduce the Project's GHG impacts as a measure of last result.

Provided above are several mitigation measures that would reduce Project-related GHG emissions. These measures offer a cost-effective, feasible way to incorporate lower-emitting design features into the proposed Project, which subsequently reduces emissions released during Project construction and operation.

A5-50

A revised EIR should be prepared that includes all feasible mitigation measures, as well as an updated GHG analysis to ensure that the necessary mitigation measures are implemented to reduce emissions to the maximum extent feasible. The revised EIR should also demonstrate a commitment to the implementation of these measures prior to Project approval, to ensure that the Project's potentially significant emissions are reduced to the maximum extent possible.

RE: Locust Gateway Development Project

Dear Mr. Ho,

I write to comment on potential impacts to biological resources that would result from development of the proposed Locust Gateway Development Project. I understand the project would add a 664,859 square-foot warehouse and a 365 vehicle stall parking lot on 44.2 acres south of W Lowell St and west of N Locust Ave in Rialto, California. My comments that follow address my concerns that the Draft Environmental Impact Report (DEIR), supported by Rocks Biological Consulting (RBC 2025), mischaracterizes the existing environmental setting, and that its impacts analysis is flawed and its mitigation measures are inadequate. A5-54

My qualifications for preparing expert comments are the following. I hold a Ph.D. degree in Ecology from University of California at Davis, where I also worked as a post-graduate researcher in the Department of Agronomy and Range Sciences. My research has been on animal density and distribution, habitat selection, wildlife interactions with the anthrosphere, and conservation of rare and endangered species. I authored many papers on these and other topics. I served as Chair of the Conservation Affairs Committee for The Wildlife Society – Western Section. I am a member of The Wildlife Society and Raptor Research Foundation, and I've lectured part-time at California State University, Sacramento. I was Associate Editor of wildlife biology's premier scientific journal, The Journal of Wildlife Management, as well as of Biological Conservation, and I was on the Editorial Board of Environmental Management. I have performed wildlife surveys in California for thirty-seven years. My CV is attached. A5-55

THE WILDLIFE COMMUNITY AS A BIOLOGICAL RESOURCE

Most environmental reviews pursuant to the California Environmental Quality Act (CEQA) focus on special-status species because CEQA's Checklist Evaluation of Environmental Impacts specifies that such evaluation includes potential impacts to special-status species. However, an important policy of CEQA is "to prevent the elimination of fish or wildlife species due to man's activities, insure that fish and wildlife populations do not drop below self-perpetuating levels, and preserve for future generations representations of all plant and animal communities and examples of the major periods of California history." Pub. Res. Code § 21001(c). This policy is not A5-56

restricted to special-status species, but it also applies to wildlife populations and plant and animal communities. In fact, the CEQA Guidelines Section 21155.1 defines wildlife habitat as "the ecological communities upon which wild animals, birds, plants, fish, amphibians, and invertebrates depend for their conservation and protection." This definition is consistent with the scientific definition of habitat, which is that portion of the environment that is used by members of a species for survival and reproduction (Hall et al. 1997). An essential portion of the environment used by any special-status species is composed of the collection of other species of plants and wildlife, because these species are forage, provisioners of refugia and nest substrates, and ecological mutualists; no special-status species can exist in a vacuum of other wildlife. The CEQA Checklist Evaluation assigns priority to special-status species to balance information and cost, but it does not exclude the need to evaluate environmental impacts to other species, which, after all, are members of the very communities within which special-status species inter-depend for survival and reproduction.

A5-56

All wildlife species should be of concern in a CEQA review, but the CEQA prioritizes special-status species. The species I consider to be special-status species are those listed in California's Special Animals List inclusive of threatened and endangered species under the California and federal Endangered Species Acts, candidates for listing under CESA and FESA, California's Fully Protected Species, California species of special concern, and California's Taxa to Watch List (https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=109406), continental and region-specific US Fish and Wildlife Service Birds of Conservation Concern (https://www.fws.gov/sites/default/files/documents/birds-of-conservation-concern-2021.pdf), and naturally rare species such as raptors protected by California's Birds of Prey laws, Fish and Game Code Sections 3503, 3503.5, 3505 and 3513 (see https://wildlife.ca.gov/Conservation/ Birds/Raptors).

What follows is a summary of a site visit to detect as many of the species of wildlife as possible within the short time available. The survey was also intended to detect as many of the special-status species as possible, but with the understanding that most special-status species are less readily detectable due to rarity and crypticity. Nonetheless, the species detected can indicate the ecological integrity of the site and thus the likelihood of occurrence of special-status species not yet detected.

SITE VISIT

On my behalf, Noriko Smallwood, a wildlife biologist with a Master of Science Degree from California State University Los Angeles, visited the site of the proposed project for 1.37 hours of diurnal survey from 17:15 to 18:37 hours and for 2.3 hours of nocturnal survey from 18:37 to 20:55 hours on 23 September 2025, and for 2.6 hours of diurnal survey from 06:41 to 09:17 hours on 26 September 2025. During daylight, Noriko walked the site's perimeter where accessible, stopping to scan for wildlife with use of binoculars. At night, Noriko strapped a Pettersson M500 acoustic bat detector to a 30-foot pole, and cabled the detector to her computer, which ran Sonobat Live. Sonobat Live identifies bats to species based on the bats' sonograms that are detected by the M500. Noriko recorded all species of vertebrate wildlife she detected, including those

A5-57

2

whose members flew over the site or were seen just off the site. Animals of uncertain species identity were either recorded to the Genus or higher taxonomic level.

On 23 September 2025, conditions were sunny to partly cloudy with 12 MPH southwest wind and temperatures of 92-84° F during the diurnal survey, and clear with 7 MPH southwest wind and temperatures of 84-75° F during the nocturnal survey. On 26 September, conditions were cloudy with 2 MPH southwest wind and temperatures of 61-64° F. The site is primarily sage scrub and chaparral (Photos 1 and 2).

Noriko saw red-tailed hawk and American kestrel (Photos 3 and 4), Cooper's hawk and common raven (Photos 5 and 6), Costa's hummingbird (Photo 7), double-crested cormorant and killdeer (Photos 8 and 9), Say's phoebe (Photo 10), black phoebe and Cassin's kingbird (Photos 11 and 12), northern mockingbird (Photo 13), lesser goldfinch and bushtit (Photos 14 and 15), house finch and western meadowlark (Photos 16, 17, and 18), Bewick's wren and mourning dove (Photos 19 and 20), California towhee and California ground squirrel (Photos 21 and 22), silver-haired bat, canyon bat, and Mexican free-tailed bat (Photos 23, 24, and 25), among the other species listed in Table 1. Noriko detected 36 species of vertebrate wildlife at or adjacent to the project site, including 9 species with special status (Table 1).

A5-57

ANALYSIS OF RECONNAISSANCE SURVEY DATA

Noriko detected 36 species of vertebrate willdife, which was a large number for the brevity of her survey effort. All the species in Table 1 would lose habitat as the result of the project and its replacement of natural ground covers with impervious surfaces. Smallwood and Smallwood (2023) confirmed this habitat loss by measuring the impacts of similar developments on species richness and the abundances of wildlife. Smallwood and Smallwood (2023) directly compared the species and the numbers of animals observed prior to development to the those observed after development, while they did the same at control sites. The measured losses of these species resulting from development is indicative of habitat loss, because habitat is defined as that portion of the environment that is used for survival and reproduction by members of a species (Hall et al. 1997), and this use is inferred by observations of the presence of a species (Smallwood 2002).

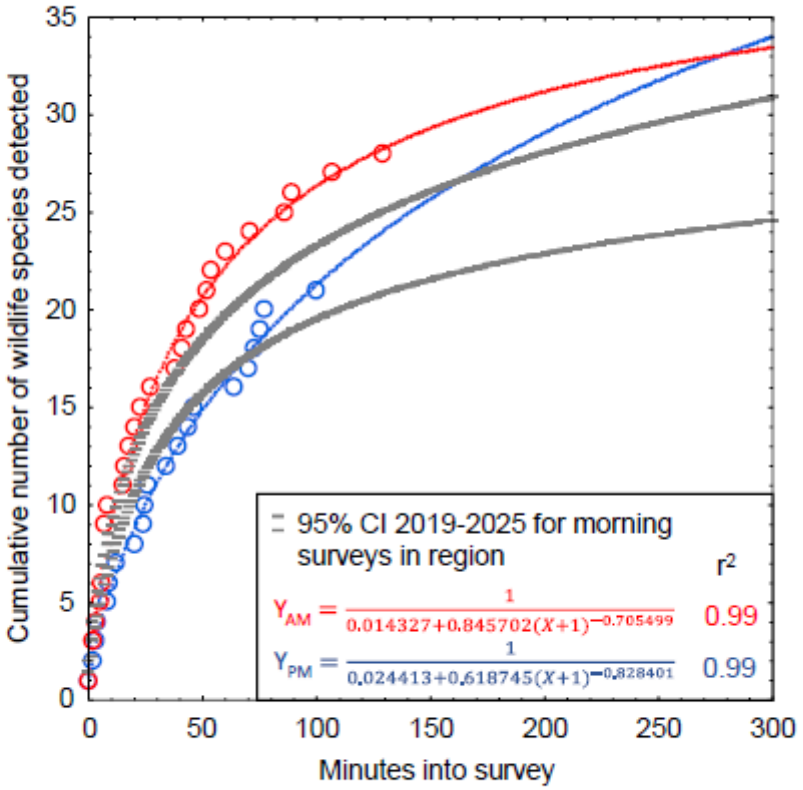
A5-58

However, the species of wildlife Noriko detected at the project site were not the only species that were present during her surveys, as there are always species that are not detected. To demonstrate this, I fit nonlinear regression models to Noriko's cumulative numbers of vertebrate species detected with time into her daytime surveys to predict the number of species that she would have detected with longer surveys or perhaps with additional biologists available to assist her. The type of model is a logistic growth model, which reaches an asymptote that corresponds with the theoretical maximum number of vertebrate wildlife species that could have been detected during the survey. The model fit to Noriko's survey data from the evening of 23 September predicts 70 species of vertebrate wildlife were available to be detected, or 49 more species than she detected that evening (Figure 1).The model fit to Noriko's survey data from the morning of 26 September predicts 41 species of vertebrate wildlife were available to be detected, or 13 more species than she detected that morning (Figure 1). The rate of species detections in the morning survey exceeded the 95% confidence interval estimated from many other

A5-59

morning surveys we completed in the region. And the patterns in her species detection rates were similar between her morning and evening surveys.

Figure 1. *Actual and predicted relationships between the numbers of vertebrate wildlife species detected and the elapsed survey time based on Noriko's visual-scan surveys on 23 and 26 September 2025.* Note the confidence interval applies only to the morning survey (red line).



A5-59

Unknown are the identities of the species Noriko missed, but the species that Noriko did and did not detect on 23 and 26 September 2025 composed only a fraction of the species that would occur at the project site over the period of a year or longer. This is because many species are seasonal in their occurrence, some require more survey effort because they are highly cryptic, and the members of other species would visit the site only periodically while patrolling large home ranges. Surveys on only two days cannot possibly detect all of the species of the local wildlife community.

At least a year's worth of surveys would be needed to more accurately report the number of vertebrate species that occur at the project site, but I only have Noriko's two surveys. However, by use of an analytical bridge, a modeling effort applied to a large, robust data set from a research site can predict the number of vertebrate wildlife species that likely make use of the site over the longer term. This analytical bridge draws inference from the pattern of species detections more than it does from the research site, and I note that the pattern, i.e., rate, of species detections is consistent from site to site.

As part of my research, I completed a much larger survey effort across 167 km² of annual grasslands of the Altamont Pass Wind Resource Area, where from 2015 through 2019 I

13

performed 721 1-hour visual-scan surveys, or 721 hours of surveys, at 46 stations. I used binoculars and otherwise the methods were the same as the methods I and other consulting biologists use for surveys at proposed project sites. At each of the 46 survey stations, I tallied new species detected with each sequential survey at that station, and then related the cumulative species detected to the hours (number of surveys, as each survey lasted 1 hour) used to accumulate my counts of species detected. I used combined quadratic and simplex methods of estimation in Statistica to estimate least-squares, best-fit nonlinear models of the number of cumulative species detected regressed on hours of survey (number of surveys) at the station: $\hat{R} = \frac{1}{1/a+b\times(Hours)^c}$, where $\hat{R}$ represented cumulative species richness detected. The coefficients of determination, r^2, of the models ranged 0.88 to 1.00, with a mean of 0.97 (95% CI: 0.96, 0.98); or in other words, the models were excellent fits to the data.

I projected the predictions of each model to thousands of hours to find predicted asymptotes of wildlife species richness. The mean model-predicted asymptote of species richness was 57 after 11,857 hours of visual-scan surveys among the 46 stations of my research site. I also averaged model predictions of species richness at each incremental increase of number of surveys, i.e., number of hours (Figure 2). On average I would have detected 15.2 species over my first 4 hours of diurnal surveys at my research site in the Altamont Pass (4 hours to match the 4 hours Noriko surveyed during daylight hours at the project site), which composed 26.67% of the predicted total number of species I would detect with a much larger survey effort at the research site. Given the example illustrated in Figure 2, the 31 diurnally active species Noriko detected after her 4 hours of daylight survey at the project site likely represented 26.67% of the species to be detected after many more visual-scan surveys over another year or longer. With many more repeat surveys through the year, Noriko would likely detect $^{31}/_{0.2667} = 116$ species of diurnally active vertebrate wildlife at the site. Assuming Noriko's ratio of special-status to non-special-status species was to hold through the detections of all 116 predicted species, then continued surveys would eventually detect 22 special-status species of diurnally active vertebrate wildlife.

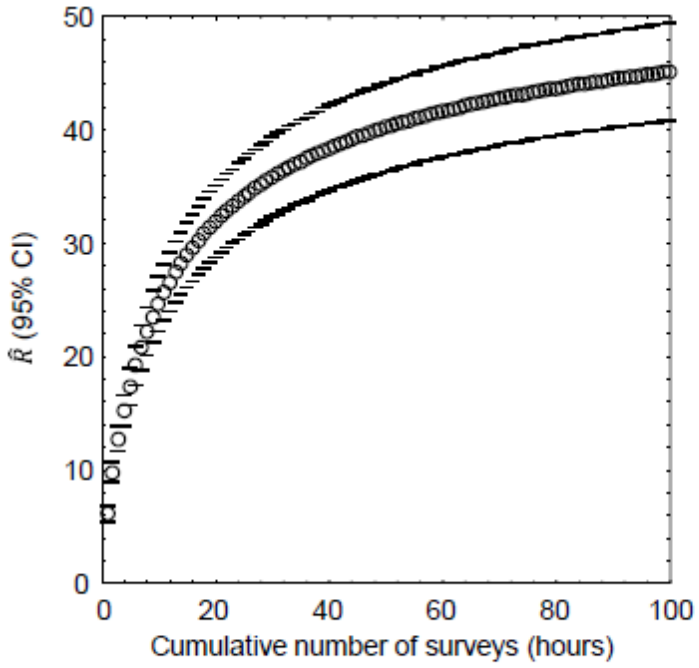
A5-59

Because my prediction of 116 species of vertebrate wildlife, including 22 special-status species, is derived from daytime visual-scan surveys, and would detect few nocturnal mammals such as bats, the true number of species composing the wildlife community of the site must be larger. Noriko's reconnaissance surveys should serve only as a starting point toward characterization of the site's wildlife community, but it certainly cannot alone inform of the inventory of species that use the site. More surveys are needed than her two surveys to produce an inventory the project site's wildlife community. Nevertheless, the large number of species I predict at the project site is indicative of a relatively species-rich wildlife community that warrants a serious survey effort.

Of particular concern is Noriko's finding of kangaroo rat burrows on the project site. Species of kangaroo rat can be difficult to identify based on their burrows, so Noriko could not identify the species of kangaroo rat that lives there. Live-trapping is needed to determine whether the burrows were constructed by the endangered San Bernardino kangaroo rat (*Dipodomys merriami parvus*) or Stephens' kangaroo rat.

14

Figure 2. *Mean (95% CI) predicted wildlife species richness, $\hat{R}$, as a nonlinear function of hour-long survey increments across 46 visual-scan survey stations across the Altamont Pass Wind Resource Area, Alameda and Contra Costa Counties, 2015–2019. Note that the location of the study is largely irrelevant to the utility of the graph to the interpretation of survey outcomes at the project site. It is the pattern in the data that is relevant, because the pattern is typical of the pattern seen elsewhere.*



A5-59

EXISTING ENVIRONMENTAL SETTING

The first step in analysis of potential project impacts to biological resources is to accurately characterize the existing environmental setting, including the wildlife community and any key ecological relationships and known and ongoing threats to special-status species. A reasonably accurate characterization of the environmental setting can provide the baseline against which to analyze potential project impacts. For these reasons, characterization of the environmental setting, including the project site's regional setting, is one of the CEQA's essential analytical steps. Methods to achieve this first step typically include (1) surveys of the site for biological resources, and (2) reviews of literature, databases and local experts for documented occurrences of special-status species. In the case of the proposed project, these steps were taken, though not with sufficient rigor and not interpreted in furtherance of an accurate characterization of the wildlife community.

A5-60

Environmental Setting informed by Field Surveys

To the CEQA's primary objective to disclose potential environmental impacts of a proposed project, the analysis should be informed of which biological species are known to occur at the proposed project site, which special-status species are likely to occur, as well as the limitations of the survey effort directed to the site. Analysts need this information to characterize the environmental setting as a basis for opining on, or predicting, potential project impacts to biological resources. In the case of this project, however, more surveys were needed.

A5-61

15

RBC (2025) conducted a reconnaissance survey on 29 October 2024 to map vegetation, assess habitats for special-status species, and to complete a general biological survey to detect species of wildlife and plants. RBC committed 1.5 person-hours to this survey, as well as another 22.66 person-hours to five non-breeding-season burrowing owl surveys between 29 October 2024 and 31 January 2025. RBC (2025) reports the bird species detected during the burrowing owl surveys, but otherwise does not report which species were detected during which surveys. In all, RBC (2025) detected 42 species of vertebrate wildlife. However, RBC (2025) fails to explain the meaning of this finding other than to point out the species that have special status, and the species that are non-native. RBC (2025) provides no context, such as what it means to have found 42 species of vertebrate wildlife on the project site. Is this the number of species RBC normally finds at project sites?

A5-62

I have maintained a record of RBC's survey outcomes that I have reviewed in my role as an expert. I have records of four of RBC's earlier survey efforts. Of these, RBC detected 7, 11, 13, and 17 vertebrate species, of which 0, 1, 2, and 5 were special-status species, respectively. RBC averaged 12 vertebrate species detections including 2 special-status species detections per site. The 42 species that RBC detected at the Locust Gateway site numbered 3.5 times the average number detected by RBC at the other four sites, and the seven special-status species of vertebrate wildlife found at the Locust Gateway site also numbered 3.5 times the number detected at the other sites. So why are there so many more species at the Locust Gateway site? And what does this relatively large number of species mean? There is no reported measure of variance, and not even a qualitative comparison of what RBC found at the Locust Gateway site as compared to what RBC or anyone else has found elsewhere.

A5-63

My records of the RBC surveys completed elsewhere reveal that RBC committed 6 person-hours starting at 09:00 hours at one site, but its survey start time and survey duration were not reported for the surveys at the other three sites. A start time of 09:00 hours was late relative to the peak activity period of wildlife, but it alone cannot explain the many fewer (11) species detected at that project site. It remains unknown whether the 3.5-fold increase in the number of species RBC detected at the Locust Gateway site was due to greater survey efforts and earlier start times, or whether it was due to a greater species richness at the Locust Gateway site.

A5-64

On the other hand, Noriko's survey outcome is comparable to the outcomes of our other surveys (see Figure 1). Her data suggest that species richness at the Locust Gateway site is higher than at most project sites we have surveyed in the Inland Empire region.

A5-65

Burrowing owl Protocol Detection Surveys

According to RBC (2025:9), "RBC qualified biologists conducted four burrowing owl surveys during the non-breeding season; surveys were conducted between October 29, 2024, and January 31, 2025, in favorable weather conditions. All surveys were scheduled to be conducted at least three weeks apart, in accordance with CDFW BUOW Guidelines." However, the CDFW (2012) guidelines recommend much longer intervals between non-breeding-season surveys than three weeks. CDFW (2012) recommends the

A5-66

16

surveys should be evenly spread across the season between 1 September and 15 February. During this time span, there should have been four surveys, each separated by about 55 days, or nearly three times the survey interval implemented by RBC (2025). RBC (2025) mistakenly applied the three-week survey spacing of the breeding season to the non-breeding season, and as a result RBC insufficiently covered the non-breeding season as recommended by CDFW (2012). Moreover, CDFW (2012) strongly recommends breeding-season surveys, and assigns priority to breeding-season surveys over non-breeding-season surveys. My own research has found that burrowing owls shift centers of activity between the breeding season and non-breeding seasons, and that the intensity of the shifts are functions of breeding-season nesting density (Figure 3). The implication is that negative findings in the non-breeding seasons do not mean that burrowing owls are absent during the breeding season.

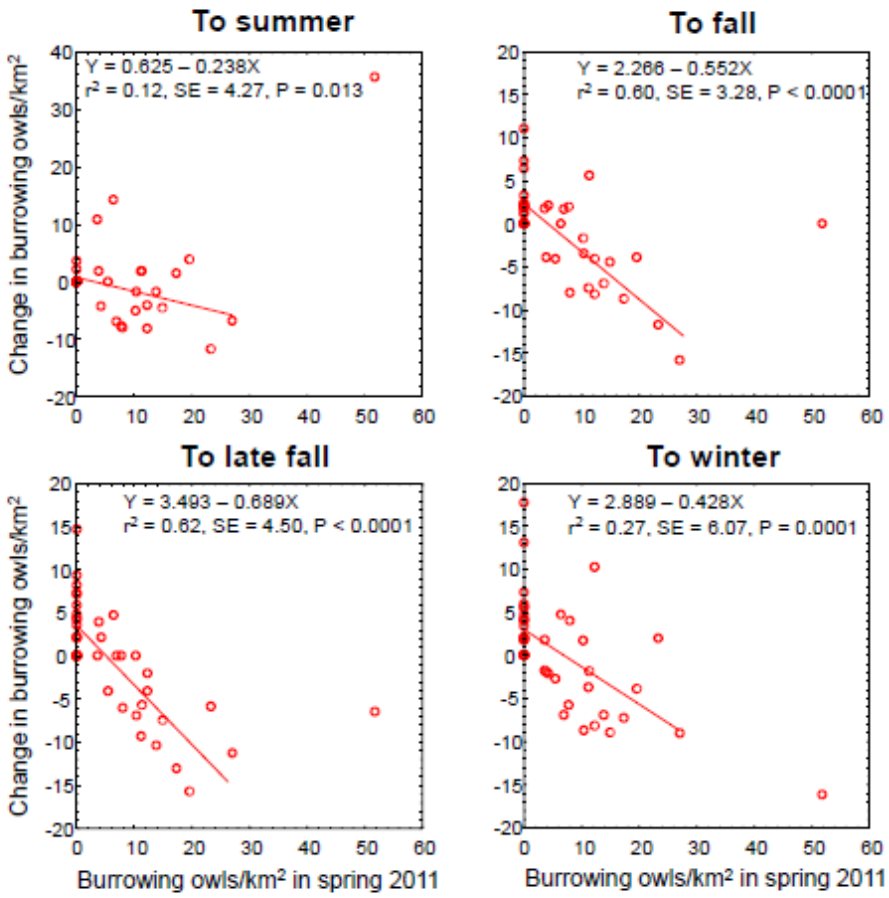


Figure 3. *Seasonal shifts in burrowing owl densities from the 2011 breeding season among 46 sampling plots in the Altamont Pass Wind Resource Area.*

A5-66

Rare Plant Surveys

RBC (2025) reportedly completed focused rare plant surveys in accordance with the standards recommended in the rare plant survey guidelines of CDFW (2018). However,

A5-67

17

although Parry's spineflower was detected in abundance on the project site, multiple other rare plant species have potential to occur on the site but RBC (2025) does not identify their blooming periods to ensure its surveys overlapped the blooming periods, nor did RBC make use of any reference sites.

A5-67

Environmental Setting informed by Desktop Review

The purpose of literature and database reviews and of consulting with local experts is to inform the field survey, and to augment interpretation of its outcome. Analysts need this information to identify which species are known to have occurred at or near the project site, and to identify which other special-status species could conceivably occur at the site due to geographic range overlap and migration flight paths. In the case of this project, the desktop review was incomplete, and the review that was completed was distorted to minimalize the likelihoods of occurrence of special-status species.

A5-68

In its reporting of how it established the pool of special-status species for assessment of occurrence likelihoods, RBC (2025) makes no mention of iNaturalist or eBird. I assume these databases were not used. If my assumption is correct, then the step of establishing the pool of species to be analyzed for occurrence likelihoods was incomplete. Even had iNaturalist and eBird been used for this purpose, it would have been inappropriate to rule out species based on absences of occurrence records. Positive-sighting databases are useful for confirming presence, but not for confirming absence of species.

To establish the pool of special-status species for assessment of occurrence likelihoods, RBC (2025) queried CNDDB for occurrence records within three miles of the project site. By querying the CNDDB to establish the pool of special-status species for analysis of occurrence likelihoods, RBC (2025) screened out many special-status species from further consideration in the characterization of the wildlife community as part of the existing environmental setting. The CNDDB is not designed to support absence determinations or to screen out species from characterization of a site's wildlife community. As noted by the CNDDB, "*The CNDDB is a positive sighting database. It does not predict where something may be found. We map occurrences only where we have documentation that the species was found at the site. There are many areas of the state where no surveys have been conducted and therefore there is nothing on the map. That does not mean that there are no special status species present.*" RBC (2025) and hence the DEIR misuse the CNDDB.

A5-69

The CNDDB relies entirely on volunteer reporting from biologists who were allowed access to whatever properties they report from. Many properties have never been surveyed by biologists. Many properties have been surveyed, but the survey outcomes never reported to the CNDDB. Many properties have been surveyed multiple times, but not all survey outcomes reported to the CNDDB. Furthermore, the CNDDB is interested only in the findings of special-status species, which means that species more recently assigned special status will have been reported many fewer times to the CNDDB than were species assigned special status since the inception of the CNDDB. Therefore, occurrence records in the CNDDB are most abundant for species assigned special status decades ago, but fewest for species only recently assigned special status. And because

negative findings are not reported to the CNDDB, the CNDDB is also inappropriate as a basis for weighting occurrence likelihoods such as absent, not expected, unlikely, low, moderate or high. Whereas the CNDDB can be confirmatory of species presence, it cannot support absence determinations or assignments of low likelihood of occurrence. And again, the screening out of a species due to lack of occurrence records in the CNDDB is the same as an absence determination, and this step is being taken without adequate support of field surveys.

In my assessment based on a database review and site visits, 138 special-status species of wildlife are known to occur near enough to the site to warrant analysis of occurrence potential (Table 2). Not all these species should be expected to occur at the project site, but each of them should be given a closer look to determine occurrence likelihoods and whether additional surveys are needed, or implementation of detection surveys, or whether it would be reasonable to assume presence. Of these 138 species, 12 (9%) were recorded on or just off the project site, and another 30 (22%) species have been documented within 1.5 miles of the site (Very close), another 30 (22%) between 1.5 and 4 miles (Nearby), and another 54 (39%) between 4 to 30 miles (In region). Half (52%) of the species in Table 2 have been reportedly seen within 4 miles of the project site. The site therefore supports at least 12 special-status species of wildlife, and it carries the potential for supporting many more special-status species of wildlife based on the proximities of recorded occurrences. Evidence certainly suggests that habitat assessments are needed for these species. A5-69

RBC (2025) considers the occurrence likelihoods of 29 (21%) of the special-status species listed in Table 2, which means that 109 (79%) of the special-status species in Table 2 were screened out of the analysis in the first step of the desktop review. Of the 29 species assessed, RBC (2025) determines 18 of them to have low or no potential of occurring on site, but five of those species have been documented within 1.5 miles of the site and another four of those species have been documented between 1.5 and 4 miles of the site. In summary, RBC's determinations of occurrence likelihoods comport only poorly with survey results and with available occurrence records in the region.

Mischaracterization of the Wildlife Community

RBC (2025) reports on field surveys and desktop review having been performed, but the field survey results are interpreted without any context to survey results from elsewhere, and the desktop review starts with an inappropriately small pool of special-status species after misusing the CNDDB and having not used eBird and iNaturalist. RBC (2025) too often resorts to speculation in its analyses of occurrence likelihoods, having not completed surveys appropriate to bats and fossorial small mammals and having committed too little survey effort overall. Speculated habitat assessments are highly uncertain, which is inappropriate for precious or rare resources such as special-status species (National Research Council 1986). The true wildlife community remains to be described. Without a more accurate characterization of the wildlife community, the basis is inadequate for predicting impacts and formulating appropriate mitigation strategies. A5-70

19

Table 2. *Occurrence likelihoods of special-status bird species at or near the proposed project site, according to eBird/iNaturalist records (https://eBird.org, https://www.inaturalist.org) and on-site survey findings, where 'Very close' indicates within 1.5 miles of the site, "nearby" indicates within 1.5 and 4 miles, and "in region" indicates within 4 and 30 miles, and 'in range' means the species' geographic range overlaps the site. Entries in bold font identify species detected by Noriko Smallwood during her site visit.*

BIOLOGICAL IMPACTS ASSESSMENT

In the following, I analyze several types of impacts likely to result from the project, none of which are analyzed adequately in the DEIR, and some of which are not analyzed at all. A5-72

REDUCED PRODUCTIVE CAPACITY FROM HABITAT LOSS

Habitat loss results in a reduced productive capacity of affected wildlife species. The site is proven to serve as habitat to at least 23 species of vertebrate wildlife which Noriko observed on the site, but the number of avian nest sites remains unknown. Because Noriko's survey was only a reconnaissance survey and therefore unsuitable for detecting all bird nests on the site, estimating total nest density of birds was not possible. The alternative method would be to infer productive capacity from estimates of total nest density elsewhere. Noriko has completed several studies to estimate total avian nest density in similar environments in the local area.

Noriko estimated 5.56 nests/acre on a 3.6-acre site of ruderal grassland bordering a woodland strip in Murrieta, and 1.86 nests/acre on another 4.83-acre grassland site bordering a strip of woodland in Murietta. The average of the above two estimates is 3.71 nests/acre. This density applied to the 44.2 acres of the project site would predict 164 nest sites. Assuming 1.39 broods per nest site based on a review of 322 North American bird species, which averaged 1.39 broods per year, then I estimate 228 nest attempts per year on the project site. Assuming Young's (1948) study site typifies bird productivity of 2.9 fledged birds per nest attempt, then I predict 661 fledglings/year at the project site. A5-73

The loss of 164 nest sites and 228 nest attempts per year would qualify as significant impacts that have not been analyzed by the City of Rialto. But the impacts would not end with the immediate loss of nest sites. The reproductive capacity of the site would be lost. The project would prevent the production of 661 fledglings per year. Assuming an average bird generation time of 4 years, the lost capacity of both breeders and annual fledgling production can be estimated from an equation in Smallwood (2022): {(nests/year × chicks/nest × number of years) + (2 adults/nest × nests/year) × (number of years ÷ years/generation)} ÷ (number of years) = 743 birds per year denied to California.

The loss of 743 birds per year would be a loss of significant habitat value that is currently provided by the project site. Most if not all these birds are protected by the federal Migratory Bird Treaty Act and by California's Migratory Bird Protection Act, both of which are intended to most strongly protect breeding migratory birds. The loss of 743 birds would easily qualify as an unmitigated significant impact.

INTERFERENCE WITH WILDLIFE MOVEMENT

One of CEQA's principal concerns regarding potential project impacts is whether a proposed project would interfere with wildlife movement in the region. The species Noriko and RBC (2025) detected on the project site had at some point moved to the site, A5-74

and in fact members of some of these species were in flight when Noriko detected them. At minimum, the project site provides wildlife with stopover opportunities during migration or dispersal of young. However, the DEIR focuses too much on the red-herring question of whether the site occurs within a movement corridor. The question is a red herring because the CEQA standard applies to all types of movement and not just the movement channeled by corridors.

However, the DEIR concludes without evidence "no wildlife movement corridors are mapped within the project site." This conclusion is based on no program of observation. There was no study design or specific field method implemented to quantify or characterize wildlife movement across the project site or beyond. A simple program of observation, for example, would be to perform timed surveys on stations located at intervals across the site, and to have observers plot wildlife flight paths on handheld maps. Another would be to use a thermal-imaging camera to track and record animal movements at night, including terrestrial mammals, birds and bats. But RBC (2025) reports nothing like this, and its analysis of wildlife movement and whether the project would interfere with it is therefore limited to speculation. Speculation is an unsound basis for making important determinations. A5-74

Whether the site includes a wildlife movement corridor is not the only consideration when it comes to the standard CEQA Checklist question of whether the project would interfere with wildlife movement in the region. The primary phrase of the CEQA standard goes to wildlife movement regardless of whether the movement is channeled by a corridor. Wildlife are obviously using the site, so they are able to travel to and from the site. Most of the birds recorded at the site are migratory birds, and the site is one of the last remaining patches of open space available to birds that need to move through the region. The project site is important to wildlife movement in the region.

TRAFFIC IMPACTS ON WILDLIFE

The DEIR neglects to address one of the project's most obvious, substantial impacts to wildlife, and that is wildlife mortality and injuries caused by project-generated traffic. Project-generated traffic would endanger wildlife that must, for various reasons, cross roads used by the project's traffic (Photos 26–29), including along roads far from the project footprint but which would nevertheless by traversed by automobiles head to or from the project's building. Vehicle collisions have accounted for the deaths of many thousands of amphibian, reptile, mammal, bird, and arthropod fauna, and the impacts have often been found to be significant at the population level (Forman et al. 2003). Across North America traffic impacts have taken devastating tolls on wildlife (Forman et al. 2003). In Canada, 3,562 birds were estimated killed per 100 km of road per year (Bishop and Brogan 2013), and the US estimate of avian mortality on roads is 2,200 to 8,405 deaths per 100 km per year, or 89 million to 340 million total per year (Loss et al. 2014). Local impacts can be more intense than nationally. A5-75

27

Photo 26. *A white-tailed antelope squirrel runs across the road just in the Coachella Valley, 26 May 2022. Such road crossings are usually successful, but too often prove fatal to the animal.*

Photo 27. *A coyote uses the crosswalk to cross a road on 2 February 2023. Not all drivers stop, nor do all animals use the crosswalk. Too often, animals are injured or killed when they attempt to cross roads.*

A5-75

Photos 28 and 29. *Raccoon killed on Road 31 just east of Highway 505 in Solano County (left; photo taken on 10 November 2018), and mourning dove killed by vehicle on a Bakersfield road (right; photo by Noriko Smallwood, 21 June 2020.)*

The nearest study of traffic-caused wildlife mortality was performed along a 2.5-mile stretch of Vasco Road in Contra Costa County, California. Fatality searches in this study

28

found 1,275 carcasses of 49 species of mammals, birds, amphibians and reptiles over 15 months of searches (Mendelsohn et al. 2009). This fatality number needs to be adjusted for the proportion of fatalities that were not found due to scavenger removal and searcher error. This adjustment is typically made by placing carcasses for searchers to find (or not find) during their routine periodic fatality searches. This step was not taken at Vasco Road (Mendelsohn et al. 2009), but it was taken as part of another study next to Vasco Road (Brown et al. 2016). Brown et al.'s (2016) adjustment factors for carcass persistence resembled those of Santos et al. (2011). Also applying searcher detection rates from Brown et al. (2016), the adjusted total number of fatalities was estimated at 9,462 animals killed by traffic on the road. This fatality number projected over 1.25 years and 2.5 miles of road translates to 3,028 wild animals per mile per year. In terms comparable to the national estimates, the estimates from the Mendelsohn et al. (2009) study would translate to 188,191 animals killed per 100 km of road per year, or 22 times that of Loss et al.'s (2014) upper bound estimate and 53 times the Canadian estimate. An analysis is needed of whether increased traffic generated by the project site would similarly result in local impacts on wildlife.

A5-75

For wildlife vulnerable to front-end collisions and crushing under tires, road mortality can be predicted from the study of Mendelsohn et al. (2009) as a basis, although it would be helpful to have the availability of more studies like that of Mendelsohn et al. (2009) at additional locations. My analysis of the Mendelsohn et al. (2009) data resulted in an estimated 3,028 animals killed per mile along a county road in Contra Costa County. The estimated numbers of fatalities were 1.75% birds, 26.4% mammals (many mice and pocket mice, but also ground squirrels, desert cottontails, striped skunks, American badgers, raccoons, and others), 67.4% amphibians (large numbers of California tiger salamanders and California red-legged frogs, but also Sierran treefrogs, western toads, arboreal salamanders, slender salamanders and others), and 4.4% reptiles (many western fence lizards, but also skinks, alligator lizards, and snakes of various species). VMT is useful for predicting wildlife mortality because I was able to quantify miles traveled along the studied reach of Vasco Road during the time period of the Mendelsohn et al. (2009), hence enabling a rate of fatalities per VMT that can be projected to other sites, assuming similar collision fatality rates.

Predicting project-generated traffic impacts on wildlife

The DEIR predicts 9,413,031 mitigated annual VMT would be generated by the project. During the Mendelsohn et al. (2009) study, 19,500 cars traveled Vasco Road in Contra Costa County daily, so the vehicle miles that contributed to my estimate of non-volant fatalities was 19,500 cars and trucks × 2.5 miles × 365 days/year × 1.25 years = 22,242,187.5 vehicle miles per 9,462 wildlife fatalities, or 2,351 vehicle miles per fatality. This rate divided into the predicted annual VMT would predict 4,004 vertebrate wildlife fatalities per year due to project-generated traffic. This would still be a large number of animals killed by the project's traffic.

A5-76

Based on my analysis, the project-generated traffic would cause substantial, significant impacts on wildlife. The EIR does not address this potential impact, let alone propose to mitigate it. Mitigation measures to improve wildlife safety along roads are available and

29

are feasible, and they need exploration for their suitability with the proposed project. Given the predicted level of project-generated traffic-caused mortality, and the lack of any proposed mitigation, it is my opinion that the proposed project would result in potentially significant adverse biological impacts, and that, as the EIR is currently written, these impacts would be unmitigated.

A5-76

CUMULATIVE IMPACTS

The DEIR's cumulative impacts analysis is flawed. The most fundamental flaw is its assumption that mitigation of a project's direct impacts would prevent cumulative impacts, which is an assumption that is inconsistent with the CEQA's definition of cumulative impacts. According to the DEIR (p. p. 4.3-25), "With implementation of MM BIO-1 through MM BIO-6, the proposed Project would not cause a significant impact to biological resources. Mitigation would include construction BMPs to avoid potential impacts and disturbance to special status species, and Parry's spineflower, burrowing owl, nesting bird, Crotch's bumble bee, Coastal whiptail, Coast horned lizard, and Southern California legless lizard pre-construction surveys and avoidance measures. Project level impacts would be less than significant with the implementation of these measures and therefore would not contribute to a cumulative impact." The notion expressed in this passage is that cumulative impacts are really only residual impacts of insufficiently mitigated direct impacts, and that sufficient mitigation of direct impacts would leave no residual impacts and therefore no cumulative impacts. But this is not how cumulative impacts are defined. Mitigation directed to the project's direct impacts cannot avoid, minimize or reduce the habitat losses and habitat fragmentation already well underway throughout the region, leaving the project site as one of the last remaining patches of habitat of many special-status species. The loss of the habitat on the project site would contribute cumulatively and very significantly to the loss and fragmentation of habitat regionally.

A5-77

MITIGATION STRATEGY

MM BIO-1: Rare Plant Mitigation Plan. *...A rare plant mitigation plan shall be prepared ... The plan will demonstrate the feasibility of conserving, enhancing, or restoring Parry's spineflower habitat in areas to be managed as natural open space without conflicting with other resource management objectives. Habitat conservation, enhancement, or restoration will be at a minimum 1:1 ratio (acres conserved, enhanced, or restored to acres impacted). If the rare plant mitigation plan proposes conservation of an extant population, the plan shall include at a minimum: (a) the location of the conserved habitat and an analysis of its suitability as compensatory mitigation; (b) an assessment of the extant Parry's spineflower populations at the proposed conservation site; (c) a long-term management plan which includes objectives, management practices, monitoring protocols, adaptive management strategies, and reporting requirements; and (d) details regarding the establishment of a non-wasting endowment to perpetually fund management of the conserved land, or such other funding mechanism acceptable to CDFW. If the rare plant mitigation plan proposes enhancement or restoration, the plan shall include at minimum: (a) collection/salvage measures for plants or seed banks, to retain intact soil conditions*

A5-78

30

and maximize success likelihood; (b) details regarding storage of plants or seed banks; (c) location of the proposed recipient site, and detailed site preparation and plant introduction techniques details for top soil storage, as applicable; (d) time of year that the salvage and replanting or seeding will occur and the methodology of the replanting; (e) a description of the irrigation, if used; (f) success criteria; and (g) a detailed monitoring program, commensurate with the plan's goals.

Essentially, the DEIR defers the formulation of a rare plant mitigation plan to some later date, presumably (but not clearly) prior to project construction. The main problem with this measure is that no candidate sites have been identified for its implementation. The DEIR does not report whether any suitable mitigation sites exist where the mitigation plan can be implemented.

A5-78

Another problem with the measure is the 1:1 mitigation ratio based on acres. Acres are not plants. The measure specifies that the acres conserved would be based on acres impacted, but the DEIR does not clarify what acres impacted means. If the acres impacted are simply the little green-bordered polygons depicted on Figure 5 of RBC (2025), then the environmental context of the inhabited acres at the mitigation site might encompass many fewer individual Parry's spineflowers or the environmental context they need. And mitigation success would be measured in acres regardless of whether the Parry's spineflowers at the mitigation site persist.

A5-79

Yet another problem is the mitigation ratio, which, assuming the same number of Parry's spinflowers are conserved as those that are destroyed by the project, truly results in a 50% loss of Parry's spinelflowers. To achieve a no-net-loss standard, a much larger mitigation ration is needed; I would suggest 5:1, and it should be based on plants, not acres.

A5-80

Finally, the DEIR fails to cite evidence of the efficacy this measure where it has been applied elsewhere. The DEIR needs to convince the public and decision-makers that the measure has already conserved Parry's spineflowers after members of this species were lost to other projects.

A5-81

MM BIO-2: Best Management Practices. *...the following monitoring requirements and Best Management Practices (BMPs) shall be implemented: a. Construction vehicles shall not exceed 15 miles per hour ... Prior to initial ground disturbing activities, a Worker Environmental Awareness Program (WEAP) shall be prepared, ...*

Should the project go forward, then I concur the listed BMPs should be implemented. However, it needs to be understood that the BMPs' conservation benefits to special-status species would be *de minimis* compared to project impacts. Most of these measures were required at most if not all the projects that my co-investigator and I surveyed before and after development to measure impacts on wildlife (Smallwood and Smallwood 2023). We revisited the sites to repeat the survey methods at the same time of year, the same start time in the day, and the same methods and survey duration in order to measure the effects of mitigated development on wildlife. We structured the

A5-82

31

experiment in a before-after, control-impact experimental design, as some of the sites had been developed since our initial survey and some had remained undeveloped. All the developed sites had included mitigation measures to avoid, minimize or compensate for impacts to wildlife. Nevertheless, we found that mitigated development resulted in a 66% loss of species on site, and 48% loss of species in the project area. Counts of vertebrate animals declined 90%. We reported that "Development impacts measured by the mean number of species detected per survey were greatest for amphibians (-100%), followed by mammals (-86%), grassland birds (-75%), raptors (-53%), special-status species (-49%), all birds as a group (-48%), non-native birds (-44%), and synanthropic birds (-28%). Our results indicated that urban development substantially reduced vertebrate species richness and numerical abundance, even after richness and abundance had likely already been depleted by the cumulative effects of loss, fragmentation, and degradation of habitat in the urbanizing environment," and despite all the mitigation measures and existing policies, regulations, and habitat plans.

A5-82

Regarding the WEAP, it should be remembered that construction workers are working with heavy machinery and moving vehicles, and therefore they need to focus on their work. The WEAP might help prevent the taking of one or a few animals, but workers should not be expected to focus on anything but work safety and performance.

MM BIO-3A: Burrowing Owl Preconstruction Surveys. *No less than 14 days prior to the onset of construction activities, a qualified biologist shall survey the construction limits of the project site and a 500-foot buffer for the presence of burrowing owls and occupied nest burrows. A second survey shall be conducted within 24 hours prior to the onset of construction activities. Time lapses between project activities greater than one week (7 days) would trigger subsequent 24-hour take avoidance surveys to confirm burrowing owl absence. The surveys shall be conducted in accordance with the most current CDFW survey methods. If burrowing owls are not observed during clearance surveys or biological monitoring, no additional conditions are required to avoid impacts to burrowing owl. The Project Applicant shall submit at least one burrowing owl pre-construction survey report to the satisfaction of the City to document compliance with this mitigation measure. For the purposes of this measure, 'qualified biologist' is a biologist who meets the requirements set forth in the BUOW Guidelines (CDFW 2012).*

A5-83

The burrowing owl is a candidate for listing under the California Endangered Species Act. Therefore, the applicant needs to consult with the CDFW as a first step and before the EIR is certified. Furthermore, the CDFW (2012) survey guidelines need to be implemented in full, meaning that breeding-season detection surveys must be completed. MM BIO-3A's preconstruction surveys cannot stand in for breeding season detection surveys, because preconstruction surveys carry nowhere near the same detection probabilities as do breeding-season detection surveys. For these reasons, MM BIO-3A is flawed and deficient.

A5-84

MM BIO-3B: Burrowing Owl Preconstruction Surveys. *If burrowing owls, active burrows, or signs thereof are confirmed during any survey or biological monitoring, project activities with the potential to impact burrowing owl shall be*

32

immediately halted. The qualified biologist shall coordinate with CDFW and prepare a Burrowing Owl Plan that shall be submitted to CDFW for review and approval prior to commencing project activities with the potential to impact burrowing owl. The Burrowing Owl Plan shall describe proposed avoidance, and monitoring actions. The Burrowing Owl Plan shall include the number and location of occupied burrow sites, acres of burrowing owl habitat that will be impacted, details of site monitoring, and details on proposed buffers and other avoidance measures if avoidance is proposed. Project activities with the potential to impact burrowing owl shall not occur within 500 feet of an active burrow until CDFW approves the Burrowing Owl Plan. If project activities, including occupied burrow exclusion and closure, could result in take of burrowing owl, the applicant shall coordinate with CDFW for appropriate CESA authorization (i.e., ITP under CFGC section 2081) prior to commencement of project activities with the potential to impact burrowing owl. The ITP shall describe, at a minimum, project activities and equipment, proposed avoidance/buffers, temporary and permanent impacts, monitoring, relocation and/or translocation, and minimization and compensatory mitigation actions. ITP compensatory mitigation will be fulfilled by one or more of following options: 1) purchase of credits at a CDFW-approved conservation or mitigation bank (if available); 2) execution of a Mitigation Credit Agreement; or 3) Permittee-responsible mitigation land acquisition. The conditions of the permit or measures outlined in the plan shall be adhered to by the applicant and any required compensatory mitigation of habitat would be provided.

A5-84

See my comment under MM BIO-3A. The applicant needs to consult with the CDFW as a first step, and not as a condition of whether a preconstruction survey results in a burrowing owl detection. This measure is unacceptable.

MM BIO-4A: Crotch's Bumble Bee Surveys. *At a minimum, two pre-construction nesting surveys shall be conducted prior to project implementation. Surveys shall occur within 1) one week; and 2) within 24-hours prior to any vegetation removal or ground-disturbing activities scheduled to occur during the Crotch's bumble bee flight season (February through October). Surveys shall follow the guidelines provided in the CDFW's Survey Considerations for CESA Candidate Bumble Bee Species (2024b) and shall occur within the project site and areas adjacent to the project site where suitable habitat exists. The surveyors shall be qualified biologists familiar with Crotch's bumble bee identification and life history.*

A5-85

Crotch's bumble bee occurs on the project site. As a first step, the project applicant needs to consult with the CDFW about how to obtain an incidental take permit for this species.

MM BIO-4B: Crotch's Bumble Bee CESA ITP. *Suitable Crotch's bumble bee habitat and Crotch's bumble bee presence has been confirmed on the site; therefore, a CESA ITP shall be applied for and obtained prior to the commencement of project activities with the potential to impact Crotch's bumble bee. The ITP shall include, at a minimum, a description of project activities and equipment, proposed avoidance/buffers, identification of temporary and permanent impacts, monitoring requirements, relocation and/or translocation protocols, and compensatory*

A5-86

mitigation measures. Compensatory mitigation will be at a minimum 1:1 ratio (acres conserved, enhanced, or restored to acres impacted). ITP compensatory mitigation shall be satisfied by one or more of the following mechanisms: 1) purchase of credits at a CDFW-approved conservation or mitigation bank (if available); 2) execution of a Mitigation Credit Agreement; or 3) Permittee-responsible mitigation land acquisition.

A5-86

See my comment under MM BIO-4A.

MM BIO-4C: Crotch's Bumble Bee Biological Monitor. *A qualified biological monitor shall conduct fulltime monitoring during removal of suitable nectar plants that is scheduled to occur during the queen flight period (February through March), colony active period (March through September), and/or gyne flight period (September through October). The monitor shall have authority to temporarily halt or redirect activities as needed to avoid unauthorized impacts.*

A5-87

See my comment under MM BIO-4A.

MM BIO-5A: Nesting Bird Surveys. *To ensure compliance with California Fish and Game Code Sections 3503, 3503.5, and 3513 and to avoid potential impacts to nesting birds, vegetation clearing and ground-disturbing activities shall be conducted outside of the bird nesting season (generally February 15 through August 31), if feasible. Regardless of the time of year, a qualified biologist shall conduct a nesting bird survey within three (3) days prior to any disturbance of the site, including but not limited to vegetation clearing, disking, demolition activities, staging, or grading.*

Regarding the start of construction outside the breeding season, "if feasible," this avoidance measure is not a requirement, but rather a condition for implementing a preconstruction survey. Moreover, its implementation would not prevent the permanent loss of the avian productive capacity that I predict in my letter herein.

A5-88

Should the project go forward, I concur with this measure. However, it needs to be understood that the conservation benefits of this measure would be *de minimis* compared to the project's potential impacts on breeding birds. This measure would not prevent the permanent loss of the avian productive capacity that I predict in my letter herein. Preconstruction, take-avoidance surveys consist of two steps, both of which are very difficult. First, the biologist(s) performing the survey must identify birds that are breeding. Second, the biologist(s) must locate the breeding birds' nests. The first step is typically completed by observing bird behaviors such as food deliveries and nest territory defense. To be successful these types of observations typically require many surveys on many dates spread throughout the breeding season even for a single species. To identify and locate the birds of all species nesting on a site requires a much greater survey effort. Even assuming all the predicted 522 nest sites could be found (not likely), the mitigation measure would apply only to the breeding season of the survey. After the breeding season of the preconstruction survey, California would be denied the production of birds from the project site during every subsequent year. The project's impacts on birds would be permanent and of large magnitude.

34

MM BIO-5B: Nesting Bird Surveys. *If active nests are identified, the biologist shall establish suitable buffers around the nests depending on the level of activity within the buffer and species observed. Buffer areas shall be avoided until the nests are no longer occupied, and the juvenile birds can survive independently from the nests. During construction activities, the qualified biologist shall continue biological monitoring activities at a frequency recommended by the qualified biologist using their best professional judgment. If nesting birds are documented, avoidance and minimization measures may be adjusted and construction activities stopped or redirected by the qualified biologist to avoid take of nesting birds. If nesting birds are not documented during the pre-construction survey, adherence to additional measures may not be necessary to avoid impacts to nesting birds.*

The mitigation language allows a single individual to make a subjective decision, outside the public's view, to determine the buffer area for any given species. This measure lacks objective criteria, and it is therefore unenforceable.

A5-89

MM BIO-6A: Special-Status Preconstruction Lizard Surveys. *Within 30 days prior to the commencement of any on-site project activities, a qualified biologist shall conduct preconstruction surveys in suitable special-status lizard habitat throughout the project site. ... A minimum of one daytime survey during suitable weather for lizard activity shall be conducted by walking linear transects spaced to provide 100 percent coverage of suitable habitat. The location of any observed special-status lizards shall be documented. If feasible, the locations of any special-status lizards shall be avoided. Avoidance measures shall be monitored by the qualified biologist.*

The required survey should have been completed in support of the preparation of the DEIR. Deferring this survey until the preconstruction phase effectively bypasses the part of the environmental review that is intended to be slated for informing the pubic and decision-makers with an accurate characterization of the existing environmental setting.

A5-90

MM BIO-6B: Special-Status Preconstruction Lizard Surveys. *If pre-construction surveys are positive for coastal whiptail, coast horned lizard, or Southern California legless lizard and avoidance is not feasible, CDFW shall be notified in writing. In addition, relocation of all observed special-status lizard individuals shall be attempted and, if feasible, lizards would be relocated to the nearest available suitable habitat on conserved land in consultation with CDFW.*

See my comment under MM BIO-6A. Moreover, the capture and relocation of lizards can be seen as cruel to the animals in the receiving areas. Dumping lizards into areas where the same species already reside would increase competition for mates, home ranges and forage, hence adding stress to residents and forced emigrants as well. The carrying capacities of the species at issue cannot be increased, so relocations would ultimately result in the same numbers of individuals that existed in the receiving areas as before the relocations. But these same numbers would be settled upon after the social chaos forced on residents in the receiving areas as a result of this measure. Although I am sure it is not the intent of this measure to be cruel, I argue it would be cruel and unethical to relocate lizards from the project site to the nearest available habitat.

A5-91

35

NEEDED MITIGATION MEASURES

Fund Wildlife Rehabilitation Facilities: Compensatory mitigation is needed, and it ought also include funding contributions to wildlife rehabilitation facilities to cover the costs of injured animals that will be delivered to these facilities for care. Many animals would likely be injured during construction and by collisions with automobiles traveling to and from the project site during project operations.

A5-92

Landscaping: If the project goes forward, California native plant landscaping (i.e., grassland and locally appropriate scrub plants) should be considered to be used as opposed to landscaping with lawn and exotic shrubs and trees. Native plants offer more structure, cover, food resources, and nesting substrate for wildlife than landscaping with lawn and ornamental trees. Native plant landscaping has been shown to increase the abundance of arthropods which act as important sources of food for wildlife and are crucial for pollination and plant reproduction (Narango et al. 2017, Adams et al. 2020, Smallwood and Wood 2022.). Further, many endangered and threatened insects require native host plants for reproduction and migration, e.g., monarch butterfly. Around the world, landscaping with native plants over exotic plants increases the abundance and diversity of birds, and it is particularly valuable to native birds (Lerman and Warren 2011, Burghardt et al. 2008, Berthon et al. 2021, Smallwood and Wood 2022). Landscaping with native plants is a way to maintain or to bring back some of the natural habitat and lessen the footprint of urbanization by acting as interconnected patches of habitat for wildlife (Goddard et al. 2009, Tallamy 2020). Lastly, not only does native plant landscaping benefit wildlife, it requires less water and maintenance than traditional landscaping with lawn and hedges.

A5-93

Thank you for your consideration,

Shawn Smallwood, Ph.D.

36

Response A5-1

This comment is introductory in nature. The commenter asks the City to accept the comments behalf of the Golden State Environmental Justice Alliance and requests to be added to the public interest list regarding future environmental documents.

Response A5-2

This comment summarizes information about the Project and does not raise any specific issue or questions on the environmental analysis provided in the Draft EIR.

Response A5-3

This comment incorrectly states the southern portion of the project site is located on Assessor Parcel Number (APN) 1133-02-100. The image of the parcel and APN 1133-02-100 provided by the commenter does not rely on the City of Rialto's official GIS web mapping service.[1] As identified in **Section 3.0: Project Description** of the Draft EIR, the Project would be located on APN 023-19-223. The City disagrees with this claim of the commenter. The commenter has not raised issues that would render the EIR deficient or require recirculation.

For response to the commenter's note about Summit Avenue, please see Response A5-25.

Response A5-4

The comment asserts that the Draft EIR lacks substantial evidence supporting the stated earthwork quantities (270,000 cubic yards of cut and 300,000 cubic yards of fill) and fails to identify a specific soil import site. The commenter contends that this information is necessary to accurately assess construction-related truck trips and associated impacts. Rather, the commenter provides no evidence to support this assertion. Under CEQA Guidelines Section 15384, argument, speculation, unsubstantiated opinion or narrative does not constitute substantial evidence. (*Pala Band of Mission Indians v. County of San Diego* (1998) 68 Cal.App.4th 556, 580.)

As discussed in **Section 3.0: Project Description** of the Draft EIR, the grading estimates are based on the preliminary civil engineering plans prepared for the Project, which provide a reasonable approximation of anticipated cut and fill quantities. Under CEQA, an EIR is not required to include final engineering or construction-level design drawings, nor to identify specific material sources or destinations, provided that the analysis reasonably discloses the maximum foreseeable impacts based on available project-level information (CEQA Guidelines §§15144, 15151; *Laurel Heights Improvement Assn.* (1988) 47 Cal.3d 376, 415).

The EIR's analysis conservatively assumes a net import of approximately 30,000 cubic yards of soil, which was used to quantify the maximum potential number of haul truck trips and associated air quality, greenhouse gas, and noise impacts during construction; see **Section 3.0: Project Description** of the Draft EIR. These assumptions were incorporated into the CalEEMod modeling. The import soil site and corresponding distance for analysis in the Draft EIR was generated from default CalEEMod parameters which is based on the Transportation Analysis Zone (TAZ) specific to the site's location. Reliance on these assumptions for the analysis in the Draft EIR accounts for a conservative worst-case scenario and provides an adequate and accurate environmental analysis. Further, the City will verify all Project details (i.e.,

[1] City of Rialto's online GIS Mapping Service is provided at this website address: https://gis.rialtoca.gov/portal/apps/experiencebuilder/experience/?id=89d11c74cb054b3aa22f28759e6296c7

earthwork quantities and compliance with development standards) as part of the plan check process prior to issuing permits.

The commenter has not raised issues that would render the EIR deficient or require recirculation. No changes to the document are required.

Response A5-5

This comment states that the Draft EIR does not include analysis relevant to environmental justice issues in reviewing potential Project impacts, including cumulative impacts from the proposed Project. The Draft EIR fully analyzes and discloses the Project's cumulative impacts in **Section 4.2: Air Quality** (page 4.2-32), **Section 4.5: Energy** (page 4.5-19); and **Section 4.7: Greenhouse Gas Emissions** (page 4.7-26). CEQA does not require consideration of potential implications to environmental justice or socioeconomics as a specific resource; further, environmental justice is not listed within the "Environmental Factors Potentially Affected" in Appendix G, Environmental Checklist Form, to the CEQA Guidelines. The Draft EIR analyzed the Project's potential impacts on sensitive receptors and concluded that impacts can be mitigated to a less than significant level. Additionally, the City, County, SCAQMD, and the CEQA Guidelines do not include thresholds that consider environmental justice such as the CalEnviroScreen results, but rather account for the potential health effects of a project with project-level thresholds.

This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not raise a substantive issue on the content of the EIR, no further response is warranted.

Response A5-6

See Response A5-5. There is currently no air quality guidance or thresholds to analyze areas with higher pollution burden differently from areas with lower pollution burden. However, the Draft EIR includes project-specific dispersion modeling to estimate the PM_{10} and potential of cancer risk in the vicinity of Project construction and operations. On page 4.2-16 of Draft EIR **Section 4.2: Air Quality**, the methodology for the dispersion modeling is explained. Construction dispersion modeling included all construction activity while operational modeling included idling of trucks, on-site truck movement, off-site truck movement, off-road equipment including forklifts and cargo handling equipment, and one emergency generator. Meteorological data was used from the Fontana-Arrow Highway Monitoring Station, which is representative of and nearest to the project site. The modeling included building downwash and conservative estimates for vehicle and stack heights. Risk was calculated using the State of California Office of Environmental Health Hazard Assessment (OEHHA) methodology with age sensitivity factors and frequency of time spent at home (as shown in Draft EIR Appendix C page 19 in Table 2). Table 4.2-13 in the Draft EIR (page 4.2-29) shows the unmitigated scenarios for construction, operation and combined for nearby residential, student, and worker receptors. Both construction and operational cancer risk is less than 2 per one million for all receptors. The commenter has not raised issues that would render the EIR deficient or require recirculation.

Response A5-7

See Response A5-5. The comment states information from OEHHA on hazardous waste and solid waste facility impacts. The project site is located within the 160-acre area and the former bunker area of the larger Rockets, Fireworks, and Flares (RFF) Superfund site (formerly known as the B.F. Goodrich site).Development of the Project will result in a benefit to the community by developing a currently vacant and underutilized site that is environmentally constrained due to its location within the RFF Superfund

site, and will ensure the careful and thorough removal of any unexploded ordnances and discarded military munitions that may be present on the site prior to development, thus resulting in reduced hazards and increased safety for the surrounding community. Refer to **Section 4.8: Hazards and Hazardous** Materials of the Draft EIR. No further response is required.

Response A5-8

See Response A5-5. The comment discusses water quality information from OEHHA but provides no comment regarding the proposed Project. As discussed in Draft EIR **Section 4.9: Hydrology and Water Quality**, the Project will not result in any impacts to hydrology and water quality, including drinking water. No further response is required.

Response A5-9

See Response A5-5 and Response A5-7. The comment states information from OEHHA on cleanup sites but provides no comment regarding the proposed Project. Please refer to Draft EIR **Section 4.8: Hazards and Hazardous Materials** for a discussion of the RFF Superfund site. No further response is required.

Response A5-10

See Response A5-5. The comment discusses socioeconomic data but provides no comment regarding the proposed Project. No response is required.

Response A5-11

See Response A5-5 and Response A5-6. The Draft EIR included project-specific dispersion modeling to evaluate the potential environmental impacts to the communities in the vicinity of the project site.

Response A5-12

This commenter states that CalEEMod, the software used for the Draft EIR analysis, is not considered an approved compliance modeling software for non-residential uses in the State of California. CEQA does not mandate that certain tools or modeling protocols be employed in environmental analysis such as is implied by the commenter. CEQA requires that analyses be sufficient to provide decision-makers with information enabling them to make decisions that intelligently account of environmental consequences of projects (CEQA Guidelines § 15151, Standards of Significance).

With specific regard to the use of CalEEMod for the purposes of modeling energy consumption, the City has historically and successfully employed CalEEMod for this purpose. Further, the SCAQMD, the Responsible Agency for air quality considerations, sanctions use of CalEEMod to provide a "uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria pollutant and greenhouse gas (GHG) emissions associated with both construction and operational from a variety of land use projects."[2] Through the use of CalEEMod, SCAQMD integrates air quality and energy impact analyses. To ensure consistency and accuracy of analyses in support of SCAQMD policies, the City has determined that CalEEMod is appropriate for CEQA modeling of both air quality impacts and energy consumption.

The energy modeling protocols cited by the commenter (CBECC-Com, EnergyPro, and IES VE) are used for the performance approach (energy budget) method for demonstrating compliance with the Title 24 Energy Standards. The analysis included within **Section 4.5: Energy,** of the Draft EIR discloses the amount

[2] SCAQMD. (2024). Air quality modeling for CEQA. Retrieved from https://www.aqmd.gov/home/rules-compliance/ceqa/air-quality-modeling

of energy that the proposed Project would require. The analysis is not intended or required to demonstrate compliance for Title 24 energy standard performance.

The energy modeling protocols identified in the comment provide modeling of building energy consumption only, whereas CalEEMod comprehensively and cohesively provides building energy consumption estimates, as well as establishes the basis for estimation of construction activity/ construction equipment energy consumption, and mobile-source (vehicular) energy consumption. This latter category (vehicular energy consumption) comprises the majority of the proposed Project energy demand. In addition, the sources for the methodologies include studies commissioned by the California Energy Commission (CEC) and also use energy conservation standards subject to Title 24. CalEEMod User Guide Appendix D (Technical Source Documentation for Emissions Calculations) states the energy intensity estimates are based on a survey completed in 2019 with structures ranging from 1935 to 2015. The Appendix notes "default energy consumption estimates provided in CalEEMod based on the RASS (California Residential Appliance Saturation Study are very conservative, overestimating expected energy use compared to what would be expected for new buildings subject to the latest Energy Code with more stringent energy efficiency measures." Therefore, the energy estimates in **Section 4.5: Energy** of the Draft EIR are conservative. The energy modeling protocols offered by the commenter (which do not consider energy consumption attributable to construction activities or mobile sources) would vastly underestimate the proposed Project energy demands and proposed Project energy consumption.

Additionally, the Draft EIR discloses the proposed Project's electricity consumption, natural gas consumption, and transportation fuel consumption and determined that the proposed Project's energy consumption would not be inefficient or wasteful, as the proposed Project will be required to comply with the Title 24 Nonresidential Building Energy Efficiency Standards and CALGreen standards published by the CEC, which contain stringent mandatory standards for mechanical systems, lighting (indoor and outdoor), and appliances to minimize energy use. Therefore, the Draft EIR used the appropriate model to calculate and disclose the proposed Project's energy use, and also demonstrated that the proposed Project would be required to comply with Title 24 Building Energy Efficiency and CALGreen Standards. Additionally, MM GHG-2 requires buildings to meet or exceed CALGreen Tier 2 standards, which would further reduce energy consumption. Findings and conclusions of the Draft EIR are not affected. As demonstrated, the comments submitted are incorrect. Revisions to the EIR are not required.

Response A5-13

The comment states that the Draft EIR does not include an analysis of the Project's compliance with the City's General Plan buildout assumptions or the Rialto Airport Specific Plan buildout scenario, and therefore must be revised to provide this analysis.

The City disagrees. The Draft EIR adequately analyzes the Project's consistency with the City of Rialto General Plan and the Rialto Airport Specific Plan in accordance with CEQA Guidelines Section 15125(d), which requires an EIR to "discuss any inconsistencies between the proposed Project and applicable general plans." As addressed on page 4.13-6 of **Section 4.13: Population and Housing**, the proposed Project is consistent with the existing General Plan and Specific Plan designations for the site, meaning that future growth associated with Project implementation has already been accounted for in the General Plan and General Plan EIR. Because the Project is consistent with the existing General Plan land use designation and Specific Plan designation, development of the site with a warehouse use was already anticipated and analyzed.

The Project's contribution of approximately 664,859 square feet represents only a small portion (approximately 3.8%) of the total industrial buildout potential identified in the General Plan and falls within the scope of development anticipated in the City's adopted plans and environmental analyses. No substantial evidence has been provided by the comment to suggest that this amount of industrial development would exceed or conflict with the growth assumptions of the City's General Plan or Specific Plan.

Accordingly, the Draft EIR's conclusion that the Project is consistent with the City's adopted land use plans and policies is supported by substantial evidence. The commenter has not raised issues that would render the EIR deficient or require recirculation.

Response A5-14

The commenter asserts that the Draft EIR failed to analyze the Project's consistency with several goals and policies from SCAG's 2024 Connect SoCal Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and that the Project's greenhouse gas (GHG) impacts conflict with these policies.

The City disagrees. All policies cited in the comment are taken from Chapter 3.3: Regional Planning Policies of the 2024 Connect SoCal RTP/SCS. As stated in the plan, these policies are intended for County Transportation Commissions (CTCs) and local jurisdictions, which "can refer to specific policies to demonstrate alignment with the Regional Transportation Plan/Sustainable Communities Strategy when seeking resources from state or federal programs." These policies are not regulatory requirements and are not applicable to individual private development projects such as the proposed warehouse.

Furthermore, the commenter does not provide any specific explanation or evidence showing how the Project would conflict with the cited policies or why they are relevant to this Project. Many of the referenced policies, particularly those related to equitable engagement, restorative justice, and disadvantaged communities, are regional and programmatic objectives, beyond the scope or responsibility of a private development project. Further, CEQA does not require analysis of "disadvantaged communities" or "environmental justice" impacts, and the CEQA Guidelines do not define or use that terminology.

For the foregoing reasons, Equitable Engagement and Decision-Making Policies 46 and 47 and Sustainable Development Policies 48-50 cited by commenter are inapplicable to the Project. Likewise, Air Quality Policies 51-53 and Climate Resilience Policies 64-66 focus on regional or programmatic efforts and cannot directly be implemented by the Project. However, as discussed in **Section 4.7: Greenhouse Gas Emissions**, the Project's GHG analysis complies with CEQA Guidelines Section 15064.4 and demonstrates consistency with applicable State, regional, and local climate plans, including SCAG's Connect SoCal RTP/SCS, the City's General Plan, and the CARB Scoping Plan. Although the Draft EIR concludes that GHG impacts would remain significant and unavoidable, this finding does not constitute a policy inconsistency, as the Connect SoCal policies are advisory, not binding, and the Project's emissions are consistent with regional growth assumptions used in SCAG's modeling.

Accordingly, the Draft EIR's GHG policy consistency analyses are adequate and the commenter has not raised issues that would render the EIR deficient or require recirculation.

Response A5-15

The commenter states that the General Plan consistency analysis in the Draft EIR does not provide an adequate evaluation of all land use plans, policies, and regulations adopted for the purpose of reducing environmental effects.

Section 4.10: Land Use and Planning of the Draft EIR provides a discussion of Project consistency with applicable City of Rialto General Plan policies and other plans; this analysis can be found starting on page 4.10-8 in Table 4.10-1: General Plan Consistency Analysis. The analysis in the table is consistent with the thresholds of significance established in Appendix G of the CEQA Guidelines and CEQA Guidelines Section 15125 as it addresses General Plan policies that have been adopted for the purpose of avoiding or mitigating an environmental effect and that are applicable to the Project. More specifically, Section 15125(d) states "The EIR shall discuss any inconsistencies between the proposed Project and applicable general plans, specific plans, and regional plans."

The commenter asserts that the Draft EIR does not provide evidence or support that the Project does not conflict with some of the goals and policies of the General Plan. The commenter provides a list of these goals and policies but does not provide any specific explanation or evidence showing how the Project would conflict with the cited policies or why they are relevant to this Project.

With respect to the commenter's opinion regarding alleged inconsistencies, it should be noted that, under CEQA, a project is consistent with the underlying general plan if, considering all its aspects, it will further the objectives and policies of the general plan and not obstruct their attainment. A given project need not be in perfect conformity with each and every general plan policy (*Clover Valley Foundation v. City of Rocklin* (2011) 197 Cal.App.4th 200, 238). Moreover, a lead agency's determination that a project is consistent with the general plan is entitled to deference (*Id.*).

It should further be noted that not all goals and policies relate to an environmental consideration and by their nature do not require evaluation in an EIR. In making this determination, factors such as the following may be considered:

1. The goal, policy, or implementation measure does not relate, nor was it written to reduce and impact to an environmental resource;
2. The goal, policy, or implementation measure does not relate to topics requiring examination under CEQA;
3. The goal, policy, or implementation measure is beyond the scope or responsibility of a private development;
4. The goal, policy, or implementation measure is written so broadly that the responsibility for its implementation could only be the responsibility of the City.

Responses to the individual policies listed by the commenter are outlined below. The Project does not conflict with these General Plan policies. Further, these polices are advisory in nature and are not required.

- **Policy 2-9.4.** At the time of preparation of the Draft EIR, the future warehouse tenant is unknown and commercial space is not proposed as it would not be consistent with the intended industrial use of the site. If feasible, incorporation of flexible commercial spaces could be implemented at a later date.

- **Policy 2-12.2.** The Project does not require or propose any street trees or parkway landscaping within public right-of-way. As stated in **Section 4.1: Aesthetics**, of the Draft EIR, the Project would be subject to the development regulations in Section V of the Rialto Airport Specific Plan, which serve as the controlling mechanism for development within the Specific Plan. Per the Rialto Airport Specific Plan, projects designated General Manufacturing (I-GM) are required to provide a 20-foot average minimum width of landscaping from the property line along public roadways. The conceptual landscape plan is provided as Figure 3-10 in the Draft EIR Project Description. The Project would provide 20-foot-wide landscape buffers along the project site frontage of Locust Avenue and Lowell Street. A smaller landscape buffer would be provided along the western project boundary along Lake Padden Lane, which is not a public roadway. The Project would also be subject to compliance with the development standards in Rialto Municipal Code Sections 18.61.250 and 18.61.270, which include requirements for plants, landscape maintenance, and landscape buffers. The Rialto Airport Specific Plan landscape requirements are greater than the Municipal Code requirements.

- **Policy 2-16.1.** Given the nature and function of the Project, opportunities for integrating traditional public art are limited. This policy is encouragement-based and not a mandatory requirement for individual projects.

- **Policy 2-17.3 and Policy 2.17-4.** Policy 2-17.3 states "Discourage architectural monotony" and Policy 2-17.4 states "Discourage the design of boxy structures; emphasize articulation of the front façade and the horizontal plane with multi-story structures." Please refer to **Section 3.0: Project Description**, page 3-12, which addresses building design, landscaping, and lighting. Figure 3-8 in the Draft EIR depicts the conceptual elevations for the building, which shows that the Project incorporates architectural articulation, panel reveals, varying wall planes, and accent colors (white, gray, and blue) with blue window glazing. These features provide visual interest and relief. As documented in **Section 4.1: Aesthetics** and **Section 4.10: Land Use and Planning**, and Table 4.10-1: General Plan Consistency Analysis, the Draft EIR includes substantial evidence supporting the Project's consistency with applicable design policies. Please also refer to Response A5-18.

- **Goal 2-17, Policy 2-27.1.** As stated throughout the Draft EIR the project site would include approximately 160,491 sf of landscaping (9.2% of the project site). Landscaping would be focused around the site perimeters, parking areas, driveway entrances, and building entrances. The Project does not propose multiple structures with the opportunity to provide landscape plazas or green spaces between buildings.

- **Goal 2-17, Policy 2-27.2.** See response to Policy 2-12.2.

- **Goal 2-17, Policy 2-27.2.** The project site is not located on land intended for development of open space or a pocket park. This policy is advisory in nature and not required.

- **Policy 2-37.1.** This is a City initiative and not applicable to a single private warehouse development project.

Based on the above, the environmental review contained in the Draft EIR pertaining to General Plan consistency, and consistency with other applicable planning documents, meets CEQA requirements. Further, the planning consistency analysis for all applicable documents in relation to the Project was

properly tailored and used to clearly define policies that are within the applicant's ability and responsibility to address environmental impacts.

The discussion above is consistent with CEQA case law that has found that a given project need not be in perfect conformity with each General Plan policy. Accordingly, it may not be possible for every project to completely satisfy, nor is it the responsibility of every project to satisfy every goal or policy of a general plan, including those pertaining to environmental resources. Thus, the Project was evaluated for consistency with each of the applicable policies from the City of Rialto General Plan that were adopted for the purpose of avoiding or mitigating an environmental effect and through that evaluation it was determined that no additional environmental impacts from a conflict with an applicable policy would occur. No further discussion is required and no changes to the EIR have been made or are required because of this comment.

Response A5-16

The comment asserts that the Draft EIR incorrectly excluded Level of Service (LOS) analysis and that LOS remains required to evaluate consistency with Policies 4-1.20 and 4-1.21 of the City's General Plan Circulation Element.

As correctly stated in the Draft EIR, LOS is no longer used under CEQA to determine transportation impact significance. In 2018, the State of California adopted CEQA Guidelines Section 15064.3, which formally replaced delay-based metrics (such as LOS and intersection delay) with Vehicle Miles Traveled (VMT) as the appropriate measure of transportation impacts under CEQA. The Guidelines expressly state that "a project's effect on automobile delay shall not constitute a significant environmental impact" (§ 15064.3(c)).

While the City's General Plan includes LOS-based operational policies for local traffic management, those policies are not CEQA thresholds of significance. Rather, they are design and performance standards applied during City engineering review during project permitting. The Draft EIR appropriately addressed potential conflicts with applicable circulation plans and policies and found the Project consistent with the Rialto Circulation Element because the Project would provide adequate site access, internal circulation, and roadway improvements consistent with City standards.

Therefore, a detailed LOS analysis is not required for CEQA impact determination, and its exclusion does not render the EIR inadequate. As a point of information, a Transportation Impact Study (TIS) was prepared for the Project in accordance with the City's *Traffic Impact Analysis Guidelines for Vehicle Miles Traveled (VMT) and Level of Service (LOS) Assessment*. The TIS is on file with the City of Rialto Planning Department and available for public review upon request. The Project's VMT analysis included as Appendix J to the Draft EIR fulfills CEQA's current requirements, and the Draft EIR provides substantial evidence supporting its less than significant findings for transportation impacts. Accordingly, a project-level LOS analysis is not required for CEQA purposes, and the commenter has not raised issues that would render the EIR deficient or require recirculation.

Response A5-17

The comment mischaracterizes the Project's compliance with General Plan Policies 2-12.1 and 2-12.5. Lake Padden Lane is not a public roadway and therefore does not require screening under Policy 2-12.1. However, a landscape buffer is proposed along Lake Padden Lane. As stated in **Section 4.10: Land Use and Planning**, Table 4.10-1: General Plan Consistency Analysis, page 4.10-9, the Draft EIR evaluated

consistency with these policies and found the Project compliant. As referenced in Draft EIR Table 4.10-1, Figures 3-9 and 3-10 support the consistency finding as they demonstrate that the proposed design includes tree and landscape screening along public roadways, and a 14-foot-high decorative screen wall painted with accented reveals to provide visual relief. Landscaping encompassing approximately 9.2 percent of the site, including street-front buffers along Lowell Street and Locust Avenue, contributes to an attractive and varied streetscape. Accordingly, substantial evidence supports the Draft EIR's conclusion that the Project is consistent with Policies 2-12.1 and 2-12.5, and no further analysis or finding of significance is warranted. The commenter has not raised issues that would render the EIR deficient or require recirculation.

Response A5-18

The comment asserts that the Draft EIR does not provide substantial evidence demonstrating compliance with General Plan Policies 2-17.1, 2-17.3, 2-17.4, and 2-23.1, and that the Project's design—a concrete tilt-up industrial building—constitutes architectural monotony inconsistent with these policies.

The City disagrees. As documented in **Section 4.10: Land Use and Planning**, and Table 4.10-1: General Plan Consistency Analysis, the Draft EIR includes substantial evidence supporting the Project's consistency with applicable design policies. As noted on page 4.10-10 of the Draft EIR, the Project incorporates architectural articulation, panel reveals, varying wall planes, and accent colors (white, gray, and blue) with blue window glazing, as depicted in Figures 3-6 through 3-8. These features provide visual interest and relief, consistent with Policies 2-17.1 and 2-23.1, which emphasize variety in planes, textures, and façade treatments.

Moreover, CEQA does not require an evaluation of aesthetics or architectural style based on subjective aesthetic preferences (*see Bowman v. City of Berkeley* (2004) 122 Cal.App.4th 572, 592). The City's adopted Precise Plan of Design review process ensures that the final building design conforms to the City's design standards and visual quality expectations. Accordingly, the Draft EIR provides substantial evidence demonstrating consistency with the City's General Plan design policies and no revision is required.

Response A5-19

The commenter misrepresents the Draft EIR's analysis of Policy 2-23.2, which encourages architecture that disaggregates large buildings into smaller parts with greater human scale.

As outlined in the comment and stated in the consistency analysis table on page 4.10-11 of the Draft EIR, the Project would include vertical articulation, glazing, and color variation across the façades, along with the use of contrasting tones (white, gray, and blue) and changes in wall plane depth to visually break up the building's form.

The City disagrees with the commenter's claim that these elements do not reduce massing. The Draft EIR provides substantial evidence—both descriptive and graphical—demonstrating that the Project's vertical articulation, color, material diversity, and landscaping collectively meet the intent of Policy 2-23.2. Accordingly, the Draft EIR's determination that the Project is consistent with Policy 2-23.2 is supported by substantial evidence, and no revision to the EIR is required.

Response A5-20

The commenter claims policy consistency analysis is inaccurate due to modeling software used in the Draft EIR. This is further addressed in the Response A5-12 above. The Draft EIR provides substantial evidence and adequate analysis demonstrating consistency and no revision is required.

Response A5-21

The commenter misrepresents the Draft EIR's analysis and conclusions regarding population and employment generation. The Draft EIR does not make speculative assumptions; rather, it relies on data from the Southern California Association of Governments (SCAG) Rialto 2019 Local Profiles Report and SCAG's 2024 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), as stated on page 4.13-5 of the Draft EIR, to evaluate the Project's employment and population context.

As discussed in **Section 4.13: Population and Housing**, the Draft EIR concludes that the Project is consistent with the General Industrial General Plan designation and General Manufacturing Specific Plan designation, both of which already account for warehouse and employment-generating uses in the City's long-range land use projections. Employment generation was estimated using SCAG's accepted employment density factor for industrial/warehouse uses (one employee per 1,195 sf), resulting in approximately 557 operational employees. This estimate is a reasonable and conservative basis for CEQA analysis.

The Draft EIR's statement that new jobs "would likely be filled by the local labor market" is supported by SCAG data, referenced on page 4.13-5, showing that approximately 92.4 percent of Rialto residents commute outside the City for employment, meaning the Project would help balance the City's jobs-to-housing ratio and provide opportunities for local employment. CEQA does not require a demographic or skills-based labor market analysis to determine worker qualifications or interest; such economic assessments are outside CEQA's scope.

The commenter's suggestion that construction or operational workers commuting from outside the City would substantially increase VMT or emissions is also unfounded and is not supported by substantial evidence. Construction and operational worker trips were already analyzed in the Air Quality, Greenhouse Gas Emissions, and Transportation sections of the Draft EIR using CalEEMod and the City's Traffic Impact Analysis Guidelines, which incorporate regional commute distances typical of the Inland Empire labor force. These analyses therefore capture the full range of potential environmental effects associated with worker travel. Accordingly, the Draft EIR includes substantial evidence and no additional or revised analysis of population, housing, or labor market effects is required.

Response A5-22

The comment asserts that the Project would generate 557 employees, representing 13 percent of Rialto's projected job growth from 2019–2035, and claims that the Draft EIR did not demonstrate that such growth was anticipated by the Rialto General Plan, SCAG's Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), or the Air Quality Management Plan (AQMP).

The City disagrees. The commenter mischaracterizes the Draft EIR's employment analysis and its consistency findings. As discussed in **Section 4.13: Population and Housing**, pages 4.13-6 and 4.13-7, the Draft EIR demonstrates that the Project is consistent with the site's existing General Plan and Rialto Airport Specific Plan land use designations. Warehouse and employment-generating industrial uses on the project site are already assumed in the City's planned growth capacity, and therefore the employment associated

with the Project is accounted for in the Rialto General Plan buildout projections and the General Plan EIR. The estimate of 557 operational employees is based on SCAG's Employment Density Study (jobs per square foot), an accepted regional methodology, and does not induce substantial unplanned population growth, consistent with CEQA Guidelines Section 15126.2(d).

The commenter's assertion that 557 jobs would constitute "significant growth" misunderstands the nature of SCAG's growth forecasts. SCAG's Connect SoCal 2024 Demographics and Growth Forecast incorporates local general plans and specific plans into its regional growth allocation. Because the Project is consistent with both adopted land use designations, the employment growth associated with the Project is already included in SCAG's regional projections, including the RTP/SCS and the regional AQMP, which relies on the same SCAG forecasts. The commenter has not raised issues that would render the EIR deficient or require recirculation.

Response A5-23

The comment asserts that the Draft EIR must include a cumulative analysis of employment growth from recently approved or pending industrial projects since 2019 to determine whether combined job growth would exceed SCAG or General Plan forecasts.

The City disagrees. The Draft EIR's cumulative analysis appropriately relied on SCAG's 2024 Connect SoCal Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and the City of Rialto General Plan (adopted in 2024) as the basis for evaluating cumulative growth. The SCAG's RTP/SCS forecasts reflect the City's adopted land use designations and buildout potential; therefore, any project consistent with the General Plan and the Rialto Airport Specific Plan is, by definition, accounted for in the cumulative employment projections used by SCAG and the South Coast Air Quality Management District (SCAQMD) in preparing the Air Quality Management Plan (AQMP). Moreover, any projects that have since been developed and are already operational are properly accounted for as part of the baseline conditions.

As identified in **Section 3.13: Population and Housing**, the Project is consistent with the existing General Plan and Rialto Airport Specific Plan land use designations, which already anticipate large-scale industrial and logistics uses. The Project's approximately 557 employees are within the type and scale of employment assumed in SCAG's Connect SoCal forecasts and the Rialto General Plan EIR. Please also refer to Response A5-13 and A5-22. Accordingly, the Draft EIR provides an adequate cumulative analysis and the commenter has not raised issues that would render the EIR deficient or require recirculation.

Response A5-24

The comment asserts that the Draft EIR fails to evaluate the Project's consistency with the Rialto Circulation Element and the Rialto Airport Specific Plan with respect to the planned extension of Summit Avenue through the project site, and contends that the Project conflicts with those plans because it does not include the extension of Summit Avenue to Locust Avenue. The comment further claims that General Plan and Specific Plan amendments are required and that the Draft EIR must be revised accordingly.

The Draft EIR appropriately evaluates the Project's consistency with the current, applicable circulation network and related policies. The City of Rialto General Plan Circulation Element identifies a conceptual alignment of Summit Avenue extending eastward to Locust Avenue. However, no existing or dedicated right-of-way for this segment of Summit Avenue exists across the project site or adjacent parcels. Moreover, the area that would have accommodated this conceptual alignment has been encumbered by

existing development and permanent structures since the mid-1990s, including industrial facilities and the Mid-Valley Landfill, making the extension of Summit Avenue physically infeasible.

The City's Engineering and Planning staff have confirmed that no capital improvement, right-of-way acquisition, or entitlement actions are planned or funded to construct this segment of Summit Avenue. The Rialto Focused General Plan Update retained the conceptual depiction of Summit Avenue on Exhibit 4.1 as a legacy element from earlier plans; however, the planned roadway segment is not an actionable or implementable improvement and has been superseded by subsequent development patterns and circulation system modifications.

Consistent with CEQA Guidelines Section 15125(a), the Draft EIR properly describes and analyzes the Project in relation to existing and reasonably foreseeable physical conditions, rather than speculative or abandoned circulation concepts. The Draft EIR's transportation analysis relies on the current City roadway network and functional classification. Because the planned extension of Summit Avenue is not part of the existing or foreseeable circulation network, the Draft EIR was not required to analyze this speculative future roadway.

The Project's circulation design provides safe and efficient access via Locust Avenue and Lowell Street, in full conformance with City standards for driveways, truck circulation, and emergency access. As documented in the Draft EIR, the Project would not conflict with adopted transportation policies, plans, or programs that address the circulation system within the City or region, and no potentially significant impacts would occur. Accordingly, the Draft EIR does not require revision, and no General Plan or Specific Plan amendment is necessary. The Project remains consistent with the applicable General Plan Circulation Element and Rialto Airport Specific Plan policies when considered in light of existing site conditions and the City's current circulation framework.

Response A5-25

The comment asserts that the Draft EIR incorrectly excluded Level of Service (LOS) analysis and that LOS remains required to evaluate consistency with Policies 4-1.20 and 4-1.21 of the City's General Plan Circulation Element. See Response A5-16.

Response A5-26

The comment asserts that the Draft EIR is deficient because it does not include the Project Scoping Agreement required under the City's *Traffic Impact Analysis Guidelines for Vehicle Miles Traveled (VMT) and Level of Service (LOS) Assessment.* The Traffic Scoping Agreement was approved by the City Public Works Department on April 25, 2024 and was included in the TIS as Appendix A, which is on file with the City of Rialto Planning Department and available for public review upon request. The Project Scoping Agreement is also provided as **Attachment B**.

Response A5-27

The commenter states that Appendix J: VMT Analysis underestimates vehicle miles traveled (VMT) generated by Project operations because the analysis assumes 246 employees, while the Population and Housing section references 557 employees based on SCAG employment density factors.

The employee estimate used in Appendix J reflects the methodology typically applied in VMT analyses, which rely on standard Institute of Transportation Engineers (ITE) trip generation factors and employment rates calibrated to building square footage and land use type. This approach is consistent with the City's

Traffic Impact Analysis Guidelines for VMT and LOS Assessment and with statewide practice under SB 743 implementation. The Population and Housing section, by contrast, uses SCAG's Employment Density Study ratios solely to estimate employment growth for demographic context; it does not inform trip generation or VMT modeling. Because VMT is primarily a function of land use type, building intensity, and regional trip lengths—not the precise number of employees—the use of 246 employees in the VMT model provides an appropriate and representative estimate of trip generation for the proposed warehouse use. Accordingly, the commenter has not raised issues that would render the Draft EIR deficient or require recirculation.

Response A5-28

The commenter claims that the Draft EIR's VMT analysis is inadequate because it excludes truck, trailer, and delivery van trips from the operational VMT assessment and therefore underrepresents total Project-generated VMT.

The VMT analysis in Appendix J of the Draft EIR was prepared in accordance with SB 743 and the City's Traffic Impact Analysis Guidelines for VMT and LOS Assessment. These authorities specify that VMT analyses are limited to light-duty passenger vehicle travel, which is the metric used to evaluate consistency with statewide greenhouse gas reduction goals. Heavy-duty truck VMT is not part of the SB 743 transportation impact metric, as those emissions are instead addressed under air quality and greenhouse gas (GHG) analyses. The Project's operational truck and delivery vehicle activity assumed for the proposed warehouse use was fully analyzed in **Section 4.2: Air Quality** and **Section 4.7: Greenhouse Gas Emissions**. Therefore, the Draft EIR provides a complete analysis of both employee commute VMT and truck-related emissions.

The Project's VMT analysis properly focuses on passenger vehicle travel associated with employee commutes and visitor trips; it is methodologically correct and consistent with legislative intent under SB 743. Accordingly, the Draft EIR's VMT analysis is adequate and the commenter has not raised issues that would render the EIR deficient or require recirculation.

Response A5-29

The commenter claims that Appendix J is inadequate because it does not include the San Bernardino Transportation Analysis Model (SBTAM) model input parameters or output screens used to support the VMT analysis.

The SBTAM is a regional travel demand model and its full datasets and software outputs are not typically appended to project-level CEQA documents due to their size, complexity, and licensing restrictions. Consistent with CEQA Guidelines Section 15151, the Draft EIR includes sufficient information in Appendix J to describe the model inputs, assumptions, and results used to evaluate Project-generated VMT. SBTAM model files and output data are provided as **Attachment C**. The commenter has not raised issues that would render the EIR deficient or require recirculation.

Response A5-30

The commenter asserts the Draft EIR has not adequately analyzed the Project's potential to substantially increase hazards due to a geometric design feature, specifically as it relates to conflict between vehicles due to truck movements.

The commenter misclassifies movements on Lowell Street. As Lowell Street is classified as an Industrial Collector, trucks are allowed to use the width of the road to turn into and out of the site. If a driveway entrance or exit is occupied by a vehicle/truck, the incoming or outbound vehicle/truck would not be visually obstructed from seeing each other. In addition, No Parking Signs on the outbound vehicle/truck turns on Lowell Street would be provided for 100 linear feet such that parking does not obstruct the turning movement. The truck turn movements have been updated to depict the maneuverability and sight distances into and out of the project site; see exhibits provided in **Attachment D**. The commenter has not raised issues that would render the EIR deficient or require recirculation.

Response A5-31

The truck turn dimensions for the WB-67 have been added to the truck turn exhibits; see **Attachment D**. The commenter has not raised issues that would render the EIR deficient or require recirculation.

Response A5-32

The site distance analysis per the American Association of State Highway and Transportation Officials (AASHTO) requirements has been provided per the commenter's request; see exhibits in **Attachment D**. As depicted, the driveways are not obstructed by visual impacts. The commenter has not raised issues that would render the EIR deficient or require recirculation.

Response A5-33

The commenter states that the EIR does not address the Project's compliance with the General Plan buildout scenario. See Response A5-13.

Response A5-34

The commenter asserts that the EIR does not provide an adequate or accurate analysis of cumulative growth and that the Project would exceed SCAG projections. The City disagrees with the commenter. See Response A5-22 and A5-23.

Response A5-35

The commenter refers to an attached analysis from Dr. Smallwood for comments on biological resources. See Responses A5-54 through Responses A5-93.

Response A5-36

The City disagrees with the opinions of the commenter. The commenter has not raised issues that would render the EIR deficient. The commenter makes conclusory statements, but they do not pertain to any specific environmental issues other than the commenter stating the Draft EIR should be recirculated. The commenter's request for recirculation is repeated from previous comments. The commenter repeats its request for Golden State Environmental Justice Alliance to be added to the public interest list regarding future environmental documents. No further response is necessary and no changes to the EIR have been made or are required as a result of this comment.

Response A5-37

This comment is introductory in nature. The comment restates the Project Description. Responses to the comments contained in this letter are provided below in Responses A5-38 through A5-52. The comment has been noted for the record and no changes to the document have been made or are required.

Response A5-38

The commenter makes a general statement that the Draft EIR CalEEMod emissions modeling is inaccurate, citing "model inputs related to Project construction that are inconsistent with information disclosed in the DEIR." Responses to specific comments are provided below in Responses A5-39 through A5-41. No further response is required.

Response A5-39

The commenter states the Project construction schedule and any changes to CalEEMod should be provided by the Project Applicant. The comment further notes that the Draft EIR fails to provide substantial evidence to support the construction schedule and individual phase lengths.

According to the CalEEMod User's Guide, CalEEMod allows for changes to be made to the default model and for the user to provide justification for the change. The justification for any change to the default model must be supported by substantial evidence under CEQA and cannot be based on unsubstantiated data. The Project Applicant provided the construction schedule within the construction questionnaire, which is noted as justification in CalEEMod. The model inputs and analysis assumptions are provided in detail within Draft EIR Appendix B. Furthermore, CalEEMod 2022 outputs summarize changes to the model defaults in Section 8 (User Changes to Default Data) (see Draft EIR Appendix B).

All of the proposed Project air quality modeling has been conducted in conformance with SCAQMD requirements and applicable CalEEMod protocols. Findings and conclusions of the Draft EIR are not affected. Revisions to the EIR are not required.

Response A5-40

The commenter asserts that the methodology for air quality construction emissions is incorrect. The City disagrees. See response A5-39. As discussed above, CalEEMod User's Guide allows for changes to the model for project specific parameters. No further response or changes to the EIR are required.

Response A5-41

The commenter asserts that the Draft EIR does not clearly describe the extent of demolition and that the CalEEMod modeling may underestimate construction emissions due to an "unsubstantiated amount" of demolition debris.

As described in **Section 3.0: Project Description** of the EIR, demolition would be limited to "a World War II-era bunker structure and rail spurs in the southern portion of the project site and an underground transformer on the northwestern portion of the project site along Lowell Street." The 4,750 square feet of demolition reflected in CalEEMod represents an estimate of the minor amount of material on-site to be removed. This assumption was included to ensure that any limited demolition-related emissions were captured in the construction emissions analysis.

Because demolition activities are minor compared to the overall construction effort and were included in the CalEEMod inputs, the modeling does not underestimate construction emissions. The estimated emissions presented in the Draft EIR remain representative of expected conditions and adequate for determining significance under CEQA. Therefore, no revisions to the EIR or its conclusions are required.

Response A5-42

The commenter asserts that the Project may contribute to a disproportionate health risk impact to the community. See Responses A5-5 and A5-6. The Draft EIR evaluated cancer health risk to the community,

see Table 4.2-13 in **Section 4.2: Air Quality** of the EIR. Project cancer risk was below SCAQMD thresholds of 10 in one million. Therefore, per SCAQMD guidance, if an individual project does not exceed a threshold it would not have a cumulatively significant impact. Revisions to the EIR are not required.

Response A5-43

The commenter describes CalEPA's CalEnviroScreen 4.0 tool and identifies the Project's census tract ranking. No comment is provide and response is required.

Response A5-44

The commenter asserts that the Project may worsen disproportionate health risks to the community. Senate Bill 1000 requires cities and counties to integrate environmental justice elements into the planning process. As it applies to the City's General Plan, the Environmental Justice General Plan Element was adopted by the City on December 10, 2024 and is addressed in the Draft EIR. See response A5-42.

Response A5-45

The commenter notes that greenhouse gas emissions and air pollutants from warehouses should be evaluated cumulatively. See Responses A5-5 and A5-6.

Response A5-46

The Warehouse CITY dashboard is a community-based visualization tool developed by the Redford Conservancy at Pitzer College and Radical Research LLC to illustrate cumulative warehouse impacts in Southern California. While the dashboard provides regional context, CEQA requires that cumulative impact analysis for this project be based on substantial evidence and accepted methodologies (e.g., CalEEMod modeling, SCAQMD guidance, and project-specific data). Therefore, the tool was not used as the primary basis for CEQA significance determinations but may inform broader discussions on regional trends and environmental justice considerations. Please also see response A5-42.

Response A5-47

The commenter claims diesel particulate matter (DPM) emissions were inadequately evaluated due to age sensitivity factors (ASFs) not being accounted for in the Draft EIR's Appendix C page 25. The specific ASFs used in the health risk modeling are shown on Draft EIR Appendix C page 18 and 19, as well as throughout the appendix of Draft EIR Appendix C; refer to Health Risk Assessment Appendix A. The equation specific to each modeling scenario, which includes ASFs, is also shown in Health Risk Assessment Appendix A.

The commenter identified a typographical error in the equation shown on Appendix C page 25, which has been corrected and is shown below and in Final EIR Section 3.0, Errata. This correction does not change the analysis provided in the EIR. No further response or changes to the EIR are required.

> To estimate the cancer risk, the dose is multiplied by the cancer potency factor, <u>the ASF,</u> the exposure duration divided by averaging time, and the frequency of time spent at home (for residents only):
>
> $$Risk_{inh\text{-}res} = (Dose_{air}*CPF*\underline{ASF*}(ED/AT)*FAH)$$
>
> $Risk_{inh\text{-}res}$ = residential inhalation cancer risk (potential chances per million)
> $Dose_{air}$ = daily dose through inhalation (mg/kg-day)
> CPF = inhalation cancer potency factor ($mg/kg\text{-}day^{-1}$)

ASF = age sensitivity factor for a specified age group (unitless)
ED = exposure duration (years)
AT = averaging time of lifetime cancer risk (years)
FAH = fraction of time spent at home (unitless)

Response A5-48

The commenter provides a summary of the Draft EIR's GHG findings, states that under CEQA the Draft EIR must implement all feasible mitigation measures, and argues that additional feasible mitigation measures are available. Refer to Response A5-49 for information on the City's review of the commenter's suggested GHG mitigation measures.

Response A5-49

The commenter asserts that the Draft EIR should include additional mitigation measures to further reduce the Project's GHG emissions and suggests several measures purported to be feasible. These include requirements for future tenants occupying the Project to use advanced transportation technologies, alternative vehicle fuels, alternative generator fuels, and advanced building construction methods, as well as train staff. The Project will install solar photovoltaic (PV) panels or other source of renewable energy generation on the site, or will otherwise acquire energy from the local utility that has been generated by renewable sources, such that either option will provide 100 percent of the expected building electrical load. The building will be designed to meet or exceed CALGreen Tier 2 standards in effect at the time of building permit application; see MM GHG-1 and GHG-2. MM AQ-4 requires the preparation of a Transportation Demand Management (TDM) program, detailing strategies that would reduce the use of single occupant vehicles by employees, and MM AQ-5 requires non-diesel cargo handling equipment.

However, the commenter provides no evidence demonstrating that additional measures are feasible for the City to monitor or for the Project Applicant to implement. This is particularly true with respect to zero-emission heavy-duty truck technology, which is not yet widely or commercially available. No substantial evidence has been provided showing how such technology could realistically be used by Project tenants or that the local electricity provider, Southern California Edison, has sufficient capacity to meet the energy demands of an all-electric heavy-duty truck fleet for a facility of this size.

Moreover, the commenter offers no evidence that the suggested measures would actually or substantially reduce the Project's GHG emissions. CEQA does not require the adoption of every conceivable mitigation measure but only those that are feasible and would "substantially lessen" a project's significant effects (Public Resources Code § 21002). As the court explained *in San Franciscans for Reasonable Growth v. City and County of San Francisco* (1989) 209 Cal.App.3d 1502, 1519, a lead agency's duty to require mitigation applies only when such measures would avoid or substantially lessen significant effects; "the agency need not, under CEQA, adopt every nickel and dime mitigation scheme brought to its attention." Likewise, *Napa Citizens for Honest Government v. Napa County Board of Supervisors* (2001) 91 Cal.App.4th 342, 365, confirms that an EIR should focus on mitigation that is feasible, practical, and effective.

As demonstrated in the Draft EIR and supported by substantial evidence in the record, the Project already incorporates all feasible mitigation measures capable of substantially reducing its GHG emissions. Therefore, no additional mitigation measures or revisions to the EIR are required.

Response A5-50

The commenter recommends the consideration of local carbon offset programs to reduce as a last resort. Refer to Response A5-49. As discussed in Response A8-4, reliance on carbon offsets cannot ensure enforceable or effective mitigation under CEQA.

Response A5-51

The comment suggests the Draft EIR should be revised to include all feasible GHG mitigation measures. Refer to Response A5-49 regarding all feasible GHG mitigation measures. No revisions to the EIR are required.

Response A5-52

The commenter's statement is a standard professional disclaimer noting that their review was based on limited information and may be updated if additional data become available. The comment has been noted for the record and no changes to the Draft EIR have been made or are required as a result of this comment.

Response A5-53

This comment is a summary of the commenter's qualifications. The qualification pages of the comment letter are provided in full in **Attachment A**. This comment does not raise any specific issues or questions on the environmental analysis provided in the Draft EIR.

Response A5-54

This comment introduces the letter and summarizes the Project Description. This comment provides a summary statement of the commenter's concerns but does not raise any specific issues or questions on the environmental analysis provided in the Draft EIR. Specific comments on the Draft EIR are provided and responded to below.

Response A5-55

This comment is a summary of the commenter's qualifications. It does not raise any specific issues or questions on the environmental analysis provided in the Draft EIR.

Response A5-56

This comment summarizes the commenter's argument that all wildlife species should be considered in a CEQA review and presents the commenter's definition of "special-status species." It should be noted that the commenter's definition is broader than the one used in the Draft EIR and arguably extends beyond standard industry practice, precedence, and relevant case law. Please refer to **Section 4.3: Biological Resources** of the Draft EIR for a full discussion of applicable regulations and definitions pertaining to identification of special-status species. This comment does not raise any specific issues or questions on the environmental analysis in the Draft EIR. Specific comments on the Draft EIR are provided and addressed below.

Response A5-57

This comment is a summary of two site visits conducted by the commenter's employee. The comment includes photographs taken during the site visits, as well as a list of all wildlife species observed or otherwise detected. This comment does not raise any specific issues or questions on the environmental analysis in the Draft EIR.

Response A5-58

This comment summarizes the number of wildlife species observed during the site visits conducted by the commenter's employee from the perimeter of the project site and argues that habitat for these species would be lost as a result of the proposed Project. The Draft EIR acknowledges and analyzes this loss of habitat; refer to **Section 4.3: Biological Resources**.

Response A5-59

This comment summarizes a predictive analysis conducted by the commenter to justify the assumption that more species are present on the site than would have been observed. Sub-sampling, as was carried out for the Project's biological study, is a standard industry practice to acquire data for technical studies in support of environmental review. Regulatory agency protocols are established for more focused surveys of sites that may support certain special-status species to improve likelihood of detection and adequately analyze impacts on those species. Rocks Biological Consulting conducted numerous surveys at the project site as a part of the EIR technical analyses between October 2024 and June 2025 including focused protocol surveys for burrowing owl, rare plants, and Crotch's bumble bee. Approximately 59 person hours were spent surveying the site resulting in the observation of 75 animal (including insects) and 96 plant species as described in the August 2025 Biological Technical Report (BTR) included as Appendix D to the Draft EIR (see Table 1 page 6 for a summary of surveys conducted and Appendix B of the BTR for the list of species observed). Accordingly, the level of survey effort carried out for the biological resources analysis was in line with industry standards and precedent for a project of this size, type, and location. Additionally, Rocks Biological Consulting has conducted biological field work in Rialto for over two decades. Both field-level and principal biologists are highly qualified to detect plants and wildlife in the area possessing extensive knowledge of the local biological resources. In addition to field surveys and local knowledge, assessments also incorporated information from agency and citizen science databases to evaluate the potential for special-status species to occur. An assessment of the potential for rare small mammal species to be present, such as San Bernadino kangaroo rat, is provided in Draft EIR **Section 4.3: Biological Resources**, Table 4.3-1: Special Status Species Potential to Occur within the Project Site, on page 4.3-13. Habitats were not considered suitable, and the site is isolated from extant populations by adjacent development. Disagreement among experts does not render an EIR inadequate. (CEQA Guidelines § 15151).

Response A5-60

The commenter opines that the wildlife community associated with the project site was not accurately characterized. The City disagrees with the opinion of the commenter. As explained in response to Comment A5-59, the background review conducted and level of survey effort carried out at the project site is in line with standard industry practice, regulatory agency accepted protocols, and precedent for CEQA review, and provides adequate information for the public and decision-makers to consider potentially significant project consequences. Draft EIR **Section 4.3.4: Methodology**, pages 4.3-15 through 4.13-16 and pages 6 through 10 of the BTR in Appendix D detail the background review, site reconnaissance, and focused field survey methods. No further response is required.

Response A5-61

The comment summarizes CEQA objectives and the need to establish baseline conditions at a project site, claiming that more surveys were needed to adequately characterize the project site. See response A5-59 and A5-60 above, which summarize the numerous biological surveys conducted at the site. Biological

surveys carried out by Rocks Biological Consulting entailed 10 separate survey events and captured seasonal variation (fall, winter, spring, early summer) providing more than adequate data on existing site conditions. No further response is required.

Response A5-62

The comment is a summary of Rocks Biological Consulting's biological site surveys (reconnaissance and focused burrowing owl) and the number of wildlife species (and special-status species) observed during those surveys. In addition, Rocks Biological Consulting conducted rare plant and Crotch's bumble bee surveys that are not acknowledged by the commenter (see detailed response A5-59 above). The commenter questions the meaning of the findings regarding the number of wildlife species observed. This data as presented in the BTR, Appendix D of the Draft EIR, is for the purpose of characterizing the site's biological conditions, as required by CEQA and pointed out by the commenter in Comment A5-61. CEQA does not require an analysis or comparison of the survey findings between unrelated project sites as is suggested by the commenter. Rocks Biological Consulting's survey findings at other project sites are irrelevant from a CEQA standpoint as well as a biological perspective, as project sites surveyed by consultants vary widely in size, location, and habitat quality. Thus, comparisons cannot be drawn out of context. Furthermore, the commenter does not include the unrelated survey reports in their literature cited list, so it is unclear which project sites are being compared.

Response A5-63

The commenter references biological surveys conducted by Rocks Biological Consulting at other project site and questions why the findings for the proposed Project are not compared to other (unnamed/undisclosed) sites. See Response A5-62. The results of surveys at select other project sites are not relevant as the site location, size, habitat quality, and focused survey requirements may have been substantially different. No further response is needed.

Response A5-64

The commenter more species were detected on the project site than on other (unnamed/undisclosed) sites. See Response A5-62 and A5-63.

Response A5-65

The commenter notes that surveys conducted at other sites by the commenter's biological consultant had fewer resources. This comment is noted for the record but is irrelevant to the proposed Project; see Response A5-62 and A5-63.

Response A5-66

The commenter suggests that the non-breeding season burrowing owl surveys should have been done over greater time intervals. As shown on Draft EIR **Section 4.3: Biological Resources**, Table 4.3-2: Summary of Biological Surveys Conducted on page 4.13-6, non-breeding season surveys for burrowing owl were spaced out over the fall 2024 and winter 2025 period with surveys beginning in October and ending in late January. Additionally, as noted in **Section 4.3: Biological Resources,** page 4.13-19, focused surveys conducted at the site in spring and summer 2025 included inspection of potential habitat for burrowing owl. Thus, seasonal variability in owl presence/absence was adequately covered by the surveys. Additionally, the Draft EIR impact analysis assumes that future occupancy of the site by burrowing owl is a possibility and is addressed accordingly through mitigation measures to reduce and/or avoid potential impacts (see MM BIO-3A and BIO-3B).

Response A5-67

The commenter states that the blooming period for rare plant species with the potential to occur on the site was not identified. The commenter is incorrect. Draft EIR **Section 4.3: Biological Resources**, Table 4.3-1: Special Status Species Potential to Occur within the Project Site, on pages 4.3-8 through 4.3-9 identifies the blooming periods of special-status plant species with potential to occur in the project region. As demonstrated by this table, focused rare plant surveys were conducted during the seasonal timeframe (May and June) when those species identified as having a reasonable potential to occur on site would have been detectable. Reference sites for Parry's spineflower were not necessary as this species was detected on site. All other potentially occurring species were considered to have a low or very low potential, and thus identification of reference sites was not warranted or feasible as the habitat for such species is lacking.

Response A5-68

The commenter suggests that the literature and database reviews and consultation with local experts was inadequate. Special-status species evaluated for their potential to occur on site are listed in Draft EIR **Section 4.3: Biological Resources**, Table 4.3-1: Special Status Species Potential to Occur within the Project Site, on pages 4.3-8 through 4.3-13, and as noted a full list is presented in the BTR in Appendix D, Table 4. Standard databases were reviewed to assist in creation of these lists although other sources, including professional experience and local expertise, augment the database information. As stated in **Section 4.3: Biological Resources,** on page 4.3-7, and page 7 of the BTR included as Appendix D, database results, along with local biological knowledge, were used for assessment of special-status species' potential for occurrence on or adjacent to the project site. If surveyors had determined a special-status species had a moderate or high potential to occur based on conditions observed on site, the species would have been disclosed and assessed – whether it had been identified in the desktop analysis or not, as there is concurrence that database absence does not prove site absence. The potential for special-status species to occur at the project site was refined by considering the habitat affinities of each species, field habitat assessments, vegetation mapping, and knowledge of local biological resources which, although not specifically stated in the methodology, includes review of iNaturalist and eBird – hence these sources are cited on page 52 of the BTR which is included as Appendix D to the Draft EIR. This methodology corresponds to standard industry practice for developing potential to occur lists for project sites.

Response A5-69

The commenter questions the use of a three-mile buffer for the special-status species database search. A three-mile database query buffer was considered adequate to capture occurrences in the area of the site given its proximity to urban development and is an acceptable local lead agency practice for CEQA review. Other resources are reviewed and local knowledge incorporated as part of the background review as described in response to Comment A5-68, not merely the three-mile database search. Thus, screening of other species that are not necessarily included in Draft EIR **Section 4.3: Biological Resources**, Table 4.3-1: Special Status Species Potential to Occur within the Project Site, occurred as part of the review process. Those species for which potential habitat is present are documented within three miles, and/or have a heightened sensitivity status are included for further evaluation. The commenter indicates that some of the special-status species identified as having a low or no potential to occur have been documented within two miles of the site, questioning this determination. Potential to occur on site is not merely based upon proximity to the site. As described in the response to Comment A5-68, habitat suitability is evaluated in the field to further refine a species' potential for occurrence. Species excluded from discussion were not

expected or were considered to have a low likelihood of occurrence due to a lack of suitable habitat features or only marginal habitat suitability on site, as detailed in **Section 4.3: Biological Resources**, Table 4.3-1: Special Status Species Potential to Occur within the Project Site. Further, the City does not concur with the commenter's claim that a set number of special-status species occur on site merely based on their presence within a 4-mile radius. Varying sites have vastly different species richness and diversity based on many factors (e.g., habitat/vegetation types, quality and diversity, site size, urban disturbance, fragmentation and isolation). Lastly, the potential for occurrence determinations are made during the field survey, not during desktop review; no species were screened out during the initial database search.

Response A5-70

The commenter opines that the wildlife community was not adequately characterized. The methods employed to characterize the wildlife community are in line with industry standards and accepted lead and regulatory agency protocols as described in Response A5-59 through A5-62, A5-68, and A5-69.

Response A5-71

This comment provides a table of special-status species that have been recorded in natural resource databases within 30 miles of the project site. Please reference the response to Comment A5-69 regarding the methodology used by Rocks Biological Consulting to narrow down the list of species analyzed in the Draft EIR and BTR included as Appendix D. A broader list (as provided in this comment) which encompasses habitats and ecoregions far beyond that of the project site is not necessary for evaluation of Project impacts and CEQA adequacy.

Response A5-72

This comment provides an introduction to a discussion of impacts provided by the commenter and indicates impact analysis in the Draft EIR is not adequate, but does not identify specific analyses that are inadequate or lacking. More specific comments on the Draft EIR are provided and addressed below.

Response A5-73

The commenter opines that the loss of migratory birds would be a significant and unavoidable impact. The commenter provides a mathematical equation (nests per acre) from an unrelated site in Murietta. The opinion of the commenter are not based on factual information for the project site. Estimation of nest density is not required under CEQA and is not standard industry practice for species that are not considered rare under CEQA thresholds. Nesting birds are protected by the Migratory Bird Treaty Act and California Fish and Game Code as discussed in **Section 4.3: Biological Resources** on page 4.3-1. These regulations protect against direct take of active nests; they do not regulate future reproductive success of individual birds as such extrapolations are not required for common (i.e., non-rare) wildlife species under CEQA significance criteria. As required by MM BIO-5A, a pre-construction nest survey will be required prior to project development in compliance with State and federal law to avoid loss of individual birds and active nest sites. Accordingly, the Project will reduce impacts to these resources to a less than significant level per CEQA requirements.

Response A5-74

The commenter states that because wildlife was observed on the site, including migratory birds, the site is important to wildlife movement. As discussed in **Section 4.3: Biological Resources** on page 4.3-14, the site is surrounded by existing development, creating barriers to dispersal by overland wildlife movement, and is not identified as a corridor in CDFW biogeographic mapping. Accordingly, the site does not likely

function as part of a regional wildlife corridor as discussed in **Section 4.3: Biological Resources** on page 4.3-23. The analysis recognizes that native habitat on site could be utilized "by wildlife as a refuge between larger areas of naturally occurring habitat" and these natural areas are identified for the regional vicinity. Additionally, it is acknowledged that species capable of flight may use the site as a stepping-stone refuge. Thus, the assertion in this comment that only absence of a "movement corridor" was analyzed is inaccurate. The potential impacts associated with the loss of the site as a movement refuge for some species is disclosed and analyzed accordingly based on CEQA significance criteria.

Response A5-75

The commenter states that the Draft EIR does not address wildlife injury and mortality from vehicles. Traffic impacts and potential vehicle strikes are addressed in **Section 4.3: Biological Resources** on page 4.3-19; this analysis is related to burrowing owl. To minimize the potential for vehicle strikes, MM BIO-2 requires a construction vehicle speed limit of 15 miles per hour. Additionally, construction will occur during daylight hours to avoid impacts on nocturnal species such as coyote and raccoons, both of which are discussed in this comment as a concern for vehicle strikes. Post-construction vehicle speed limits will be equivalent to those of existing traffic for the area which is already surrounded by developed roadways and urbanization. The road mortality data sources cited in the comment are from substantially different settings as they relate to animal populations (Canada) and setting (rural roads). Species compositions, density, and behavior would be substantially different and thus these data are not comparable to the project site which is located among dense urbanization and existing human activity.

Response A5-76

The commenter states that the Draft EIR does not address wildlife injury and mortality from vehicles. Extrapolation of mortality rates from data collected on Vasco Road in eastern Contra Costa County is not appropriate for this site. Vasco Road, located in the east San Francisco Bay Area outside of urban and suburban development boundaries, is surrounded by thousands of acres of open space consisting of native grassland and oak savanna habitats. In contrast, the project site is generally bordered by urban development including warehouses, industrial office uses, a rock quarry, and landfill. As such, the species composition near the project area will be skewed to urban-adapted species as opposed to those species associated with native habitats. Additionally. wildlife densities will be naturally lower as habitat availability for wildlife is substantially reduced in an urban setting.

Response A5-77

The commenter opines that although the direct biological impacts of the Project would be mitigated, the Project would have cumulative biological impacts. The Project will compensate for overall habitat loss as discussed in this comment. **Section 4.3: Biological Resources**, pages 4.3-5 through 4.3-6 and Table 6 of the BTR included as Appendix D of the Draft EIR, identify impacts of up to 28.7 acres of vegetated habitat at the site. The remaining lands in the project area (15.6 acres) are considered developed/disturbed, providing little to no habitat value. As required by MM BIO-1 and MM BIO-4B, impacts to Parry's spineflower and Crotch's bumble bee habitat will be compensated for at a minimum 1:1 ratio. Habitat mitigation lands preserved for these species, offsetting the loss of 28.7 acres of vegetated land, will benefit other native plant and wildlife species occurring in the region and contribute to regional conservation efforts. Compensatory mitigation lands will be of higher quality than the project site lands as they must be characterized by highly suitable habitat for the target species, be placed in a Conservation Easement, and be managed for long-term habitat viability in perpetuity. Thus, there will be a net

cumulative habitat benefit associated with the Project as opposed to a cumulative loss as suggested in the comment.

Response A5-78

The commenter suggests that rare plant mitigation plan has been deferred. **Section 4.3: Biological Resource** of the Draft EIR, inclusive of MM BIO-1 prescribe criteria for the mitigation plan and mitigation site selection, both of which would be reviewed and approved by the lead agency and CDFW. As described in MM BIO-1, the selected site must either support or be enhanced to support the sensitive plant species found at the site. Further, the measure sets a minimum mitigation ratio that must be achieved. CEQA requires that mitigation must be feasible and as such, this mitigation measure was vetted accordingly before inclusion in the Draft EIR. (See Public Resources Code § 21061.1; CEQA Guidelines § 15364).

Response A5-79

The commenter suggests that mitigation based on acres impacted is not correct. As described in MM BIO-1 in **Section 4.3: Biological Resource**, the mitigation area, either occupied or enhanced/restored to be occupied, must be commensurate to the area occupied by Parry's spineflower on the project site. This would be based on both the extent of occupied habitat (polygons) and density of plants found at the impact site as shown on Figure 2 of the BTR included as Appendix D. Both occupied habitat polygons and the number of individual plants detected are provided on Figure 2. Since occupied habitat also includes a seedbank, the population could be underrepresented if mitigation was based only on the number of individuals found in a single year. A mitigation approach based on occupied habitat acreage, as proposed by MM BIO-1, achieves a more accurate compensatory mitigation area to adequately reduce impacts. Comment regarding mitigation timing is acknowledged, and the measure introduction has been revised as follows (addition underlined):

> **MM BIO-1: Rare Plant Mitigation Plan.** Parry's spineflower (CRPR 1B.1) is present on site and impacts are unavoidable; therefore, compensatory mitigation shall be provided to offset impacts. A rare plant mitigation plan shall be prepared and implemented by the applicant or its designee <u>prior to the onset of grading activities</u>….

Response A5-80

The commenter suggests a mitigation ratio of 5:1. The commenter does not provide evidence to support this suggested ratio. CEQA Guidelines allow reduction of potentially significant impacts through implementation of mitigation measures, and a less than significant level of impact is the threshold to be achieved through mitigation. Lead and responsible agencies establish significance criteria based on the sensitivity level of the resource. A "no net loss" standard for mitigation is not required by CEQA unless specified by a responsible agency as a regulatory requirement (i.e., in the case of State jurisdictional waters). There is no such "no net loss" policy for non-listed CRPR species and a minimum 1:1 compensation ratio achieves the less than significant impact threshold accordingly.

Response A5-81

The commenter states that the EIR does not address the success of Parry's Sunflower mitigation associated with other projects. An establishment monitoring period will be carried out to measure success of the mitigation as described in MM BIO-1. The mitigation plan will describe steps to be implemented if site monitoring results fall short of the success criteria and corrective actions to be taken until success is

achieved. The mitigation approach is in line with regulatory and lead agency mitigation standards for special-status plant species and has proven successful for rare plants in a variety of southern California habitats. As is also industry standard, a qualified botanist with knowledge of the specific species requirements will assist with preparation and implementation of the plan as described in MM BIO-1 to facilitate its efficacy.

Response A5-82

The comment is noted regarding study results that developed sites have less wildlife compared with undeveloped sites; however, this study did not take into account a survey of compensatory habitat mitigation lands that may have been required to offset development of the subject project sites. Without this comparison, it cannot be concluded that there is an overall loss of biodiversity. There is concurrence that Workers Environmental Awareness Protection (WEAP) training should not interfere with worker safety. Standard practice is for WEAP training to occur prior to the start of work at the project site and as required by MM BIO-2J to avoid this issue. MM BIO-2J states "all construction staff shall attend the WEAP training presentation prior to beginning work on site."

Response A5-83

The comment is noted regarding burrowing owl candidate listing, which is consistent with the status discussion provided in **Section 4.3: Biological Resources** on page 4.3-19. Coordination with CDFW has already occurred regarding the burrowing owl findings at the project site, and additional consultation would be required if results of pre-construction surveys are positive outline in MM BIO-3B. See response to Comment A5-66 regarding adequacy of the site surveys for burrowing owl.

Response A5-84

The commenter states that MM BIO-3B is not sufficient and CDFW consultation must be done before the EIR is certified. See Response A5-30. CDFW consultation has occurred and would continue if burrowing owl is positively identified through implementation of MM BIO-3A and as required by MM BIO-3B.

Response A5-85

The commenter states that the applicant needs to consult with CDFW regarding the Incidental Take Process. CDFW has been consulted, and the Project has already applied for an Incidental Take Permit for Crotch's bumble bee as required by MM BIO-4B. On November 25, 2025, CDFW determined that the application was complete.

Response A5-86

The commenter references comment A5-85. See Response A5-85.

Response A5-87

The commenter references comment A5-85. See Response A5-85.

Response A5-88

The commenter opines that the conservation benefits of MM BIO-5A would be de minimis. See Response A5-73.

Response A5-89

The comment suggests that MM BIO-5B allows for a subjective determination of a buffer area. The City disagrees. MM BIO-5A requires that a "qualified biologist" implement the measure to avoid take of active

avian nest sites. Industry standards indicate a certain level of education and training to be considered "qualified" to make avoidance recommendations and carry out compliance monitoring for nesting birds. Contrary to the statement in this comment that the measure is not enforceable, the City as the lead agency has oversight of implementation of avoidance measures (project conditions of approval) as part of the MMRP required for compliance with the adopted CEQA document. Project conditions of approval are public knowledge, and although accountability for implementation is assumed by technical professionals and the lead agency, implementation occurs within the view of the public at the project site with records of compliance maintained by the City for public review.

Response A5-90

The comment suggests that surveys have been deferred. This is incorrect. As described in the response to Comment A5-59, numerous surveys of the site have been conducted by Rocks Biological Consulting as a part of the Draft EIR (Draft EIR Appendix D), which included documentation of sensitive lizard species (coastal whiptail). Surveys conducted are in conformance with standard lead and regulatory agency protocols required for CEQA review. Survey protocols specific to lizards that are species of concern have not been established by the local or regulatory agencies, nor are they required as these species are not considered rare as defined by CEQA and recent caselaw. Nonetheless, the detection of coastal whiptail during biological surveys is indicative of site surveys being thorough and technically defensible. Although not detected, two other special-status lizards (coast horned lizard and Southern California legless lizard) are considered to have a potential to occur on site, and potential project impacts are analyzed in **Section 4.3: Biological Resources** on pages 4.3-21 and 4.3-22. Accordingly, MM BIO-6B is proposed to reduce potential impacts to these species to a less than significant level.

Response A5-91

The commenter makes several assumptions to draw the conclusion that moving lizards out of harm's way is cruel and unethical. First, this comment assumes that nearest available suitable habitat is already occupied by the special-status lizard species that may be relocated. Secondly, it assumes that the occupied habitat is at its carrying capacity. The commenter predicts that social chaos would occur if lizards are moved into habitat already occupied by the same species. Lizards are mobile and dispersal (the movement of animals from one area to another, often from their birth site to their breeding site) is a natural and frequent process. Thus, relocation from the site would mimic natural dispersal movements. In addition, not all lizards are territorial. This measure relates to coastal whiptail, coast horned lizard, and Southern California legless lizards. Southern California legless lizard is not territorial and can live in high densities. Whiptails and coast horned lizards are also non-territorial and often have overlapping home ranges with other individuals of the same species. Relocation of individuals out of harm's way is a standard avoidance practice that is acceptable mitigation for reptile species considered California Species of Special Concern. This mitigation measure is consistent with standard industry practice and adequately reduces potential impacts during construction to a less than significant level. The relocation activities would also be coordinated with the relevant regulatory agency (CDFW) as required by the mitigation measure. As discussed above, there is no biological basis for the argument that the avoidance measure is cruel and unethical.

Response A5-92

The commenter suggest that funding to a wildlife rehabilitation center be provided. The commenters suggestion is noted. Compensatory mitigation for project impacts will be provided per MM BIO-1 and MM

BIO-4B. See Response A5-75 and A5-76 regarding the potential for vehicle collisions. Biological resource mitigation measures will minimize the potential for wildlife injury as a result of the Project.

Response A5-93

The commenter suggests that California native plant landscaping be provided. Landscaping with native plants is generally preferable to non-native landscaping from a strictly biological perspective; however, it is not necessary to avoid or reduce significant impacts. As prescribed in BIO MM-2i, avoiding the use of invasive plants in landscaping would be required to reduce the potential for indirect impacts to natural habitats, plants, and animals in the region from weed infestations. Landscape planning must take into account local regulations and standards and also what is feasible in an urban environment based on irrigation limitations and requirements for fire hazard/brush management. The development of the project site is infill adjacent to already existing development and maintenance of native plant resources for a buffer native species is not necessary, as adjacent lands are urbanized. The comment also cites the need for host plants for endangered and threatened insects, including monarch butterfly; however, these species do not occur or have very low potential to occur within the immediate project vicinity, as documented in **Section 4.3: Biological Resources** on page 4.3-9. The only endangered or threatened insect identified by biological surveys focused on detection of sensitive insects was Crotch's bumble bee, which does not have a specific host plant and will readily nectar on non-native, and even invasive, plant species if the length of the flower's corolla is suitable. It is acknowledged that landscaping with native plants can lead to less water and maintenance requirements in some cases; however, this is not consistent for all native species. In many cases, successful landscaping with natives can result in increased maintenance requirements and often must be performed by native restoration experts. The City has oversight of landscaping design and will approve plans aligned with their policies related to allowable species, fire management, and water requirements.

Response A5-94

This comment includes the literature citation for the biological resources commenter from Shawn Smallwood, PhD. The citation pages of the comment letter are provided in full in **Attachment A**. This comment does not raise any specific issues or questions on the environmental analysis provided in the Draft EIR.

Rialto, CA 92376

Letter of Support for the Proposed Locust Gateway Development Project

Dear Mayor Joe Baca, Mayor Pro Tem Ed Scott, and Council members Andy Carrizales, Karla Perez, and Edward Montoya Jr.,

I am writing on behalf of Californians Allied for a Responsible Economy ("CARE CA") to express our strong support for the proposed Locust Gateway Development project ("Project"). The Project addresses environmental sustainability while providing important economic development for the city.

CARE CA recognizes that the applicant is approaching the Project in an environmentally sensitive manner, which aligns with our mission to encourage sustainable development and ensure a safe working environment for all. Environmentally friendly projects support a livable climate in Southern California where everyone can thrive by making the region more desirable for new businesses, new visitors, and new residents.

In addition, the Project will create numerous high-quality jobs by using a trained and professionalized local work force during construction, which aligns with our support for working families in the region and the City. Furthermore, we understand that operation of the Project will create substantial economic benefits for the City and region through increased property values, enhanced tax revenue, and the direct and indirect benefits of redeveloping a primarily vacant site. This type of economic development and investment has a beneficial effect on the residents and communities in the region.

Therefore, on behalf of its members and affiliates, CARE CA strongly supports the Project. We ask that the City approve the Project at its earliest convenience. We look forward to the Project being built so it can deliver jobs to the region and reoccurring economic benefits to the City.

A6-1

Sincerely,

Jeff Modrzejewski
Executive Director

Response A6-1

This comment acknowledges support for the Project by Allied for a Responsible Economy (CARE CA). The letter of support does not raise any specific issues or questions on the environmental analysis provided in the Draft EIR. No further response is required.

Comment Letter A7: Center for Community Action and Environmental Justice (CCAEJ)

CENTER FOR COMMUNITY ACTION AND ENVIRONMENTAL JUSTICE

Submitted via email to dcasey@rialtoca.gov.

Re: Locust Gateway Development Project Draft Environmental Impact Report (SCH #2024061274)

Dear Daniel Casey,

This letter is being written on behalf of the Center for Community Action and Environmental Justice (CCAEJ) to respond to the Draft Environmental Impact Report (DEIR) for the proposed Locust Gateway Development Project that would be built there in the city. After reviewing the documents, there are a few concerns with the Project and making sure that it does not overburden the community. A7-1

The biggest concern is for the routing of trucks from the Project. While the site is already part of the Airport Specific Plan and zoned industrial, we would like to ensure that truck traffic accessing the site is only able to do so via the correct routes and is **not** able to go through communities to reach the Project. While it is good to see that there are several references to Locust being the truck route that would serve the Project, it is important to ensure that trucks are dissuaded from using other routing such as Ayala north of Casmalia and Bohnert to access the Project. This is crucial to ensuring that truck traffic is not introduced into more residential areas of the city as a result of the Project. A7-2

Thank you for your time and consideration of this matter. If there are any future concerns, please do not hesitate to reach out for clarification. A7-3

Sincerely,

Marven E. Norman
Environmental Policy Analyst

CCAEJ is a long-standing community based organization with over 40 years of experience advocating for stronger regulations through strategic campaigns and building a base of community power. Most notably, CCAEJ's founder Penny Newman won a landmark federal case against Stringfellow Construction which resulted in the 'Stringfellow Acid Pits' being declared one of the first Superfund sites in the nation. *CCAEJ* prioritizes community voices as we continue our grassroots efforts to bring lasting environmental justice to the Inland Valley Region.

Mailing Address
PO Box 33124
Jurupa Valley, CA 92519
www.ccaej.org

Response A7-1

This comment is an introduction to the comments provided by the Center for Community Action and Environmental Justice (CCAEJ) and does not raise any specific issues or questions on the environmental analysis provided in the Draft EIR.

Response A7-2

The City acknowledges CCAEJ's comment pertaining to the Project using truck routes to access the site so as to not introduce truck traffic to residential communities. The City concurs with the commenter's concern for truck traffic and would condition the Project to use designated truck routes, thereby ensuring Project truck traffic would not go through residential communities. This comment does not raise a substantive issue on the content of the Draft EIR, no further response is required.

Response A7-3

This comment is a concluding comment that does not raise any specific issues or questions on the environmental analysis provided in the Draft EIR.

Re: Comments on Draft Environmental Impact Report for Locust Gateway Development Project, SCH No. 2024061274

Dear Mr. Casey:

Advocates for the Environment submits the comments in this letter regarding the Draft Environmental Impact Report (**DEIR**) for the Locust Gateway Development Project (**Project**). The Project Site is located at the southwest corner of Locust Avenue and Lowell Street in the City of Rialto (**City**). The Project proposes to develop the 40-acre Project Site by constructing a 664,859 square feet warehouse, inclusive of 7,713 square feet of ancillary office space, 365 vehicle parking stalls, 398 trailer parking stalls, and a fence-secured dock area with 82 dock doors. We have reviewed the DEIR prepared in September 2025 and submit comments regarding the sufficiency of the DEIR's Greenhouse-Gas (**GHG**) analysis under the California Environmental Quality Act (**CEQA**). A8-1

The City Should Require the Project to be Net-Zero

Given the current regulatory context and technological advancements, a net-zero significance threshold is feasible and extensively supportable. GHG emissions from buildings, including indirect emissions from offsite generation of electricity, direct emissions produced onsite, and from construction with cement and steel, amounted to 21% of global GHG emissions in 2019. (IPCC Sixth Assessment Report, Climate Change 2022, WGIII, Mitigation of Climate Change, p. 9-4.) This is a considerable portion of global GHG emissions. It is much more affordable to construct new building projects to be net-zero than to obtain the same level of GHG reductions by expensively retrofitting older buildings to comply with climate change regulations. Climate damages will keep increasing until we reach net zero GHG emissions, and there is a California state policy requiring the state to be net-zero by 2045. It therefore is economically unsound to construct new buildings that are not net-zero. A8-2

Environmental groups have achieved incredible outcomes by litigation under CEQA. Two of the largest mixed-use development projects in the history of California, Newhall Ranch

10211 Sunland Blvd., Shadow Hills, CA 91040 (818) 650-0030 X101 dw@aenv.org

(now FivePoint Valencia), and Centennial (part of Tejon Ranch) decided to move forward as net-zero communities after losing CEQA lawsuits to environmental groups. The ability for these large projects to become net-zero indicates that it is achievable, even for large-scale developments. The Applicant for this Project should do the same.

We urge the City to adopt net-zero as the GHG significance threshold for this project. This threshold is well-supported by plans for the reduction of GHG emissions in California, and particularly the CARB Climate Change Scoping Plans. The CARB 2017 Scoping Plan states that "achieving no net additional increase in GHG emissions, resulting in no contribution to GHG impacts, is an appropriate overall objective for new development." (CARB 2017 Scoping Plan, p. 101.) Additionally, the CARB 2022 Scoping Plan reaffirms the necessity of a net zero target by expressing: "it is clear that California must transition away from fossil fuels to zero-emission technologies with all possible speed … in order to meet our GHG and air quality targets." (CARB 2022 Scoping Plan, p. 184.) CARB further encourages a net-zero threshold in its strategies for local actions in Appendix D to the 2022 Scoping Plan. (CARB 2022 Scoping Plan, Appendix D, pp. 24-26.)

A8-2

Moving this Project forward as a net-zero project would not only be the right thing for the City to do, but also would help protect the City and the Applicant from CEQA GHG litigation.

CEQA GHG Significance Analysis

The calculated project-related emissions amount to 10,172 metric tons of carbon dioxide equivalent (**MTCO2e**) per year (DEIR, p. 4.7-19). The City adopted a significance threshold based on Appendix G of the CEQA Guidelines: GHG emissions would be significant if the Project would (1) "Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment." (**Threshold GHG Emissions-1**); or (2) "Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases." (**Threshold GHG Emissions-2**). (DEIR, pp. 4.7-16 – 4.7-17.) Based on this, the City concluded that the Project would have significant and unavoidable GHG emissions under Threshold GHG Emissions-1 and a less than significant impact under Threshold GHG Emissions-2. To reduce this identified significant GHG impact, the GHG Analysis offered Air Quality Mitigation Measures (**MM-AQ**) 2–5, and GHG Mitigation Measures (**MM-GHG**) 1–4. (DEIR, p. 4.7-17.)

A8-3

Infeasibility Finding Lacks Substantial Evidence

The City's conclusion that the Project would not be able to achieve any mitigation beyond which was identified in the proposed mitigation measures is not supported with substantial evidence. The DEIR should have proposed more mitigation measures to be applied to the

A8-4

10211 Sunland Blvd., Shadow Hills, CA 91040 (818) 650-0030 X101 dw@aenv.org

maximum-feasible extent in order to justify the conclusion that the Project's GHG impact would be unavoidable due to lack of feasibility of further mitigation. While the proposed mitigation measures are a good start, the City did not demonstrate that these actions would represent the maximum feasible mitigation to support a finding that the Project's impact would be significant and unavoidable.

CEQA requires that the lead agency identifies specific reasons for the infeasibility of further mitigation when concluding that a significant and unavoidable impact will occur. There are other readily available mitigation measures, and some of the individual proposed mitigation measures could be modified to provide further mitigation.

Around 93 percent of the Project's GHG impact originates from mobile sources, which the mitigation measures were not focused on reducing. (DEIR, p. 4.7-25.) Truck emissions alone make up 79% of the Project's mobile emissions.[1] The City claims that mobile emissions are not controllable, and therefore not feasible to mitigate, stating: "neither the Project Applicant nor the City has control over these [mobile] standards." (DEIR p. 4.7-18.)

A8-4

Still, the City has the ability to directly and indirectly control the emissions associated with this Project by imposing feasible mitigation measures to reduce emissions from trucks serving the Project. For instance, the City could mandate that the applicant's lease agreements include clauses limiting the use of heavy-duty diesel trucks, or that tenants' vehicle fleets use non-diesel fuels such as gasoline, ethanol, or biofuels. Additionally, the City could require the applicant to ensure that future tenants use hybrid or zero-emission commercial vehicles when these become reasonably available and to maintain a charging system for the vehicle fleet powered by solar panels on the Project site, proportional to the number of dock doors. After implementation of measures to the extent feasible, the City could also require the purchase of carbon offsets to reduce emissions from the Project, including offsetting mobile emissions. This kind of mitigation is both feasible and necessary to achieve the Project's fair share of emissions reductions. Thus, the conclusion that further mitigation is infeasible was not supported by substantial evidence.

The City Should Have Found a Significant Impact Under Threshold GHG Emissions-2

The DEIR analyzed consistency with the 2022 CARB Scoping Plan, the City of Rialto Climate Adaptation Plan (**CAP**), and the 2024–2050 Regional Transportation Plan/Sustainable Communities Strategy (**Connect SoCal RTP/SCS**). Due to inadequate analysis, the DEIR overlooks the Project's conflict with the 2022 Scoping Plan, while failing to acknowledge and analyze all applicable GHG reduction plans.

A8-5

[1] $(\frac{8{,}029\ MTCO2e}{10{,}172\ MTCO2e}) \times 100 = 78.93\%\ (DEIR, p.\ 4.7-19)$

The 2022 CARB Scoping Plan places particular emphasis on decarbonizing industrial facilities by "displacing fossil fuel use with a mix of electrification, solar thermal heat, biomethane, low- or zero-carbon hydrogen, and other low-carbon fuels to provide energy for heat and reduce combustion emissions." (2022 CARB Scoping Plan, p. 208.) Based on the analysis provided in the EIR, the Project does not appear to meet this objective. It's continued reliance on diesel fuel in construction equipment, heavy-duty trucks, and emergency backup generators creates a conflict with the Scoping Plan. (See DEIR, p. 4.2-14, 4.5-15.)

A8-5

The DEIR Should Have Analyzed All Applicable Plans

The City chose, as its second GHG threshold, whether the Project would "[c]onflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases." (DEIR, p. 4.7-17.) This language requires that the EIR analyze the Project's consistency with *all* other applicable plans, not just the plans that the City prefers to analyze.

The 2017 Scoping Plan was developed to help California comply with SB 32, which mandates a 40% reduction in GHG emissions below 1990 levels by 2030 (Health & Safety Code § 38566). The EIR does not explain how the Project aligns with these objectives or the 2050 goal of reducing emissions by 80% below 1990 levels. Moreover, the 2017 Scoping Plan sets statewide per capita GHG emissions targets of 6 MTCO2e by 2030 and 2 MTCO2e by 2050 (CARB Scoping Plan, p. 99). With the Project's per-service population GHG emissions of 16.8 MTCO2e/capita the Project significantly overshoots the 2050 target.[2]

A8-6

The Project significantly overshoots the 2050 target with GHG emissions of 18 MTCO2e per service population. Given that the 2050 target must be achieved within the Project's operational lifespan, it is evident that the Project will remain inconsistent with the 2017 Scoping Plan's long-term goals. Therefore, the Project's GHG impact is significant under the second threshold because it directly conflicts with established plans for reducing GHG emissions.

Consequently, the City did not demonstrate that the Project would be consistent with applicable plans, and there is evidence that the Project would have a significant GHG impact under the second threshold because it is inconsistent with applicable plans for the reduction of GHGs.

[2] $10{,}172\ MTCO2e \div 558\ employees = 18.22\ MTCO2e/service\ population$

10211 Sunland Blvd., Shadow Hills, CA 91040 (818) 650-0030 X101 dw@aenv.org

The Project's GHG Impacts Must be Fully Mitigated

CEQA requires that the Project include fair-share mitigation for all significant cumulative impacts. (*Napa Citizens for Honest Gov't v. Napa County Board of Supervisors* (2001) 91 Cal.App.4th 342, 364.) Here, the City's determination that the Project would have a significant cumulative GHG impact requires mitigation of the full extent of the Project's GHG emissions. The DEIR claims that no other mitigation measures are feasible, beyond the identified mitigation measures. But that conclusion is incorrect, and not supported by substantial evidence.

A8-7

The amount of GHG emissions that comprises the Project's fair share is clear. The reasonable lifespan of this Project is approximately 30 years as indicated by the amortization of construction emissions. (DEIR, p. 4.7-18.) Therefore, the Project would likely contribute over 305,160 MTCO2e during its entire lifespan.[3] This would be a good starting point from which to subtract the effect of additional non-offset mitigation measures, before purchasing carbon offsets.

A8-8

In addition to implementing zero-emission vehicle fleets to the extent feasible, several on-site mitigation measures are feasible, including exclusive use of electric-powered equipment in construction, installing solar water heaters, and installing automatic light switches, among many other mitigation strategies that can be incorporated in the Project as design features or as mitigation measures. Such features could be adopted individually or as part of a comprehensive goal of sustainable building certification, such as Leadership and Energy and Environmental Design (**LEED**), that extends further beyond CALGreen requirements.

The DEIR does not consider the use of electric or hybrid construction equipment as a feasible mitigation measure. This Project will rely on diesel-powered construction equipment, which contributes substantially to GHG emissions. (DEIR, p. 4.2-16.) Incorporating electric vehicle (**EV**) or hybrid construction equipment would reduce both short-term construction emissions and long-term operational emissions.

A8-9

The DEIR states the Project will comply with CALGreen § 5.106.5.3 mandatory requirements for EV charging infrastructure in nonresidential developments. (DEIR, p. 4.2-34.) The project plans to have 365 vehicle parking stalls, 398 trailer parking stalls, and 82 dock doors. (DEIR, p. 1-1.) Under CALGreen, only 18 vehicle parking stalls would be required to have EV chargers.[4] The DEIR does not consider installing EV charging infrastructure at the Project's 82 dock doors, which could support medium- and heavy-duty electric trucks and reduce transportation-related GHG emissions. It is feasible to exceed CALGreen's minimum requirements by equipping some dock doors with chargers and exceeding the minimum

[3] 10,172 MTCO2e per year × 30 years = 305,160 MTCO2e
[4] 365 *stalls* × 0.20 = 73 *EV capable spaces*; 73 *EV capable spaces* × 0.25 = *approx.* 18 *EVSE spaces*

10211 Sunland Blvd., Shadow Hills, CA 91040 (818) 650-0030 X101 dw@aenv.org

requirements for EV chargers. Overall, there are more options available to mitigate emissions to the full extent of the Project emissions, including available measures which are outlined in the California Attorney General's CEQA best practices recommendations for warehouse projects.[5]

A8-9

Carbon Offsets are Feasible as Mitigation Measures

After requiring operational emissions reductions to the maximum feasible extent, the City could also require the Applicant to purchase offsets for the Project's remaining GHG emissions. The City did not provide any evidence for why offsets would be infeasible. Overall, there are more options available to mitigate emissions to the full extent of Project emissions, and the City failed to acknowledge or implement many mitigation measures that are feasible and could help reduce the Project's GHG impact to the fair share extent.

A8-10

Offsets are acceptable mitigation measures under CEQA (Guidelines § 15126.4 (c)(3).) Many offset projects are currently operating, including projects that are relevant to the Project's operations such as the Truck Stop Electrification project in California (Project ID ACR133), among others.[6] Such offset programs are just examples of which the City could consider as feasible carbon offsets to reduce the Project's GHG impact.

Conclusion

The DEIR fails to require all feasible mitigation, despite concluding that the significant GHG impact will be unavoidable. The City should have mitigated the significant cumulative GHG impact to the fair share extent. Further, the Project would not be consistent with the applicable plans, policies, and regulations for reducing GHGs and should have found a significant GHG impact under the second threshold. Please put me on the interest list to receive updates about the progress of this Project. We make this request under Public Resources Code, section 21092.2.

A8-11

Sincerely,

Dean Wallraff, Attorney at Law
Executive Director, Advocates for the Environment

Response A8-1

This an introductory comment stating that the Advocates for the Environment reviewed the Draft EIR for the Project. The comment makes a general statement about concerns regarding the sufficiency of the Draft EIR's analysis of greenhouse gas (GHG) emissions impacts under CEQA. The comment has been noted for the record and no changes to the Draft EIR have been made or are required as a result of this comment.

Response A8-2

The commenter suggests that the City should use a net-zero GHG significance threshold. The comment also makes unsubstantiated statements that it is more affordable to construct new buildings to be net-zero now than to retrofit an old building in the future to meet the same standard. The Project does not propose the retrofit of an existing building, and will be constructed to meet or exceed CALGreen Tier 2 standards in effect at the time of building permit application; thereby ensuring efficiency and reducing the likelihood that costly retrofits will be required in the future (see MM GHG-2).

The commenter also references California's policy to achieve net-zero GHG emissions no later than 2045 (presumably AB 1279). It should be noted that the State has not adopted a net-zero GHG threshold (or any GHG threshold) for individual development projects. The State's policy to achieve net-zero GHG emissions by 2045 requires the California Air Resources Board (CARB) to ensure that Scoping Plan updates identify and recommend measures to achieve carbon neutrality, and to identify and implement policies and strategies that enable carbon dioxide (CO_2) removal solutions and carbon capture, utilization, and storage (CCUS) technologies. As discussed in Draft EIR pages 4.7-24 through 4.7-25, the Project would not conflict with the CARB Scoping Plan following compliance with all applicable regulations. The Project will install solar photovoltaic (PV) panels or other source of renewable energy generation on the site, or will otherwise acquire energy from the local utility that has been generated by renewable sources, such that either option will provide 100 percent of the expected building electrical load. The building will be designed to meet or exceed CALGreen Tier 2 standards in effect at the time of building permit application. (See MM GHG-1 and GHG-2). Mitigation Measure AQ-4 will require preparation of a Transportation Demand Management (TDM) program, detailing strategies that would reduce the use of single occupant vehicles by employees, and Mitigation Measure AQ-5 requires non-diesel cargo handling equipment.

The commenter states that two of the largest mixed-use developments in the history of California have moved forward as net-zero communities after losing CEQA lawsuits. However, these projects represent large new mixed-use communities, which differ from the Project in terms of size, scale and GHG emissions sources (i.e., heavy trucks vs. passenger vehicles). The 2022 CARB Scoping Plan notes that a number of key State actions should be accounted for in local target-setting, including zero-emission light-duty vehicles (relevant to transportation electrification); smart growth/VMT reduction (relevant to vehicle miles traveled reduction); and new and existing residential and commercial buildings (relevant to building decarbonization).

The 2022 CARB Scoping Plan does not recommend a net-zero GHG threshold for individual development projects, noting that such thresholds may make it more difficult to achieve statewide goals by prohibiting or complicating projects that are needed to support the State's climate goals, like infill development or solar arrays. The Scoping Plan also cautions against using net-zero targets and specifically notes that jurisdictions considering a net-zero target should carefully consider the implications it may have on

emissions in neighboring communities and beyond. Appendix D page 18 of the Scoping Plan states the following:

> Jurisdictions should also avoid creating targets that are impossible to meet as a basis to determine significance. For example, a net-zero target may imply that the GHG emissions of any project that are not reduced or offset to zero would be considered potentially significant. This may lead to undue burdens and frustrate project approval processes, which may be particularly problematic for residential development in climate-smart, infill areas. In addition, some jurisdictions have more land capacity to remove and store carbon, while others host GHG-emitting facilities that serve necessary functions and will take time to transition to new technology (e.g., municipal wastewater treatment plants, landfills, energy generation facilities).

Local governments have the discretion to adopt targets that apply to their jurisdictions as long as those targets are supported by substantial evidence. The Draft EIR uses a GHG threshold developed by the SCAQMD, which is based on substantial evidence as explained in the Draft EIR **Section 4.7: Greenhouse Gas Emissions** on page 4.7-17. Based on these thresholds, which are supported by substantial evidence, impacts would be significant and unavoidable impact for Threshold GHG-1 and a less than significant impact for Threshold GHG-2.

The Project is a speculative warehouse and is not comparable to the large mixed-use projects identified by the commenter in terms of size/scale and GHG emissions sources. As noted by the commenter, the State has regulations in place to reduce GHG emissions. The Project will comply with all requirements as required by law. The comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR or the Project's environmental effects; therefore, no further response is warranted.

Response A8-3

This comment summarizes the Draft EIR GHG findings of a significant and unavoidable impact for Threshold GHG-1 and a less than significant impact for Threshold GHG-2. As the comment does not raise any issues with respect to the content and adequacy of the Draft EIR or the Project's environmental effects, no further response is warranted.

Response A8-4

The commenter claims that the City's conclusion that no additional feasible mitigation measures are available to further reduce the Project's GHG emissions beyond those proposed in the Draft EIR is unsupported by substantial evidence. The commenter further recommends that the City adopt additional measures targeting truck and tenant operations to reduce mobile source emissions. Suggested actions include requiring lease provisions that limit heavy-duty diesel truck use, mandating low- or zero-emission fleets, installing solar-powered charging stations proportional to dock doors, or purchasing carbon offsets. Refer to Response A5-49.

The Project will install solar photovoltaic (PV) panels or other source of renewable energy generation on the site, or will otherwise acquire energy from the local utility that has been generated by renewable sources, such that either option will provide 100 percent of the expected building electrical load. The building will be designed to meet or exceed CALGreen Tier 2 standards in effect at the time of building permit application. (See MM GHG-1 and GHG-2). Mitigation Measure AQ-4 will require preparation of a Transportation Demand Management (TDM) program, detailing strategies that would reduce the use of

single occupant vehicles by employees, and Mitigation Measure AQ-5 requires non-diesel cargo handling equipment. However, the commenter provides no evidence demonstrating that the suggested additional measures are feasible for the City to monitor or for the Project Applicant to implement. This is particularly true with respect to zero-emission heavy-duty truck technology, which is not yet widely or commercially available. No substantial evidence has been provided showing how such technology could realistically be used by Project tenants or that the local electricity provider, Southern California Edison, has sufficient capacity to meet the energy demands of an all-electric heavy-duty truck fleet for a facility of this size.

The commenter asserts that the conclusion that the Project's GHG emissions would be significant and unavoidable is not supported by substantial evidence because the Draft EIR does not identify infeasible mitigation measures. However, CEQA does not require an EIR to identify or specify potential mitigation measures and reject them as infeasible (*San Diego Citizenry Group v. County of San Diego* (2013) 219 Cal.App.4th 1, 15). A fundamental purpose of an EIR is to identify ways in which a proposed project's significant environmental impacts can be mitigated or avoided (Pub. Res. Code §§ 21002.1(a), 21081(a)(1)). To implement this statutory purpose, an EIR must identify and describe feasible mitigation measures for each of the project's significant environmental effects (Pub. Res. Code §§ 21061, 21100(b)(3); CEQA Guidelines §§ 15121(a), 15126.4(a)). When it approves a project, the City must adopt any feasible mitigation measures identified in the EIR that would mitigate or avoid the project's significant environmental impacts (Pub. Res. Code §§ 21002.1(b); 21081(a)(1); CEQA Guidelines §§ 15022, 15091(a)(1)). However, CEQA does not require analysis of every imaginable mitigation measure (*Gilroy Citizens for Responsible Planning v. City of Gilroy* (2006) 140 Cal.App.4th 911, 935; *San Franciscans for Reasonable Growth v. City & County of San Francisco* (1989) 209 Cal.App.3d 1502, 1519). An EIR should focus on mitigation measures that are feasible, practical, and effective (*Napa Citizens for Honest Gov't v. Napa County Bd. of Supervisors* (2001) 91 Cal.App.4th 342, 365; *Concerned Citizens of S. Cent. L.A. v Los Angeles Unified Sch. Dist.* (1994) 24 Cal.App.4th 826, 841). Here, the Draft EIR affirmatively incorporated all feasible mitigation measures, and the City is not required to speculate about the measures the commenter believes should be considered or implemented in the Draft EIR.

The commenter also recommended the purchase of carbon offsets to reduce Project GHG emissions but did not identify a specific offset program for the City to consider. Mandating carbon offsets as mitigation does not satisfy CEQA standards, which require mitigation measures to be "real, additional, quantifiable, permanent, verifiable, and enforceable" (*Golden Door Properties, LLC v. County of San Diego* (2018) 27 Cal.App.5th 892). To qualify as adequate mitigation, offsets must come from a CARB-approved registry. However, access to such registries is limited, the availability of sufficient credits is uncertain, and there is no guarantee that the reductions achieved would be additional to existing regulatory requirements or permanent over time. Consequently, reliance on carbon offsets cannot ensure enforceable or effective mitigation under CEQA.

Accordingly, the City finds that the Project incorporates all feasible and enforceable mitigation measures currently available to reduce GHG emissions to the maximum extent practicable. Therefore, no revisions to the EIR or its conclusions are required.

Response A8-5

The commenter asserts that the proposed Project is inconsistent with the 2022 CARB Scoping Plan and would conflict with its objective to decarbonize industrial facilities by displacing fossil fuel use with electrification, solar thermal heat, biomethane, low- or zero-carbon hydrogen, and other low-carbon fuels. Contrary to these assertions, the proposed Project would not conflict with any applicable GHG

reduction plans, including CARB's 2022 Scoping Plan, the City of Rialto Climate Adaptation Plan (CAP), and SCAG's RTP/SCS.

As addressed in **Section 4.7: Greenhouse Gas Emissions** of the Draft EIR, the 2022 CARB Scoping Plan establishes a framework to achieve carbon neutrality by 2045 through zero-emission transportation, decarbonized electricity, and industrial efficiency improvements. The Project supports these statewide goals through MM AQ-2, which prohibits natural gas infrastructure and requires all-electric building systems, thereby eliminating combustion-related building emissions and supporting industrial decarbonization consistent with the Scoping Plan.

While the commenter cites the use of diesel fuel in construction equipment, heavy-duty trucks, and emergency backup generators, such activities are temporary or regulated under existing State programs. The City cannot impose restrictions on regional mobile source emissions or fleet composition, which are subject to CARB's regulatory authority. These emissions will continue to decline due to implementation of State measures such as the Advanced Clean Trucks Regulation,[3] Executive Order N-79-20, and the Mobile Source Strategy, all of which promote transition to zero-emission technologies.

Accordingly, the Project would not conflict with or impede implementation of the 2022 CARB Scoping Plan or other applicable GHG reduction plans. The Draft EIR's analysis remains adequate, and no revisions are required.

Response A8-6

The commenter claims that the Draft EIR did not analyze other applicable plans, specifically the 2017 CARB Scoping Plan.

The comment mentions the 2017 Scoping Plan's goal of 6 $MTCO_2e$ per capita by 2030 and 2 $MTCO_2e$ per capita by 2050. However, the 2022 CARB Scoping Plan updated and replaced the 2017 Scoping Plan, and as such the 2017 Scoping Plan no longer is in effect. CEQA does not require an evaluation of consistency with plans that no longer are in effect. The 2022 Scoping Plan does not include a per capita target. Statewide per capita emissions are used as a metric to evaluate statewide emissions. The comment incorrectly applies the 2017 Scoping Plan's 6 $MTCO_2e$ and 2 $MTCO_2e$ statewide metrics to the proposed Project as thresholds. A project level per capita emissions threshold has not been established by CARB. Furthermore, the Statewide GHG per capita goal is also an inappropriate comparison because it based service population on California residents and employees. There are many factors contributing to the Project's total GHG emissions that are unrelated to the on-site employee population only.

For example, the Project's emissions are primarily from trucks used to move goods that would be used by a much broader population. Therefore, it would be erroneous to compare a state-level target to an individual development project. Since it is unknown the precise number of people that would be served by the goods managed by the proposed Project annually, it would be erroneous to calculate the emissions

[3] The California Air Resources Board (CARB) has issued a notice of public hearing to consider proposed amendments to the Advanced Clean Fleets (ACF) and Low Carbon Fuel Standard (LCFS) regulations under Titles 13 and 17 of the California Code of Regulations. The proposed CARB amendments would repeal portions of the Advanced Clean Fleets (ACF) regulation that apply to private and federal fleets, following CARB's withdrawal of its federal waiver request. This change clarifies that these fleets are no longer required to comply with ACF zero-emission vehicle mandates. However, state and local government fleets would remain subject to the ACF requirements for a phased transition to zero-emission vehicles.

per capita (service population) without factoring in the number of end users. Therefore, the commenter's calculation and reasoning above is based on inaccurate assumptions.

Executive Order B-55-18 does not establish any regulations, policies, or any other type of mandate for private development projects to reduce GHG emissions. Instead, Executive Order B-55-18 directs State agencies to establish an implementation program (i.e., regulations and policies) that will allow the State to achieve carbon neutrality by 2045. The Executive Order B-55-18 reduction targets were codified by AB 1279, the California Climate Crisis Act in September 2022. The 2022 CARB Scoping Plan lays out a path to achieve the AB 1279 targets for carbon neutrality.

As addressed in Draft EIR Table 4.10-1, the proposed Project would comply with the 2022 California Green Building Standards (CALGreen) Code and would be designed to include measures that reduce GHG emissions, including providing bicycle parking, electric vehicle charging, water-conserving plumbing fixtures and fittings, water-efficient landscaping, construction waste management, and recycling requirements. The Project would also implement CALGreen Tier 2 performance standards pursuant to MM GHG-2, which exceed the minimum mandatory CALGreen requirements and would further reduce the Project's GHG emissions. In addition, CALGreen is designed to expand the use of green building practices to reduce the carbon footprint of California's new and existing inventory of buildings. As identified stated in Draft EIR Tables 4.7-4 and 4.10-1 and **Section 4.5: Energy** and **Section 4.7: Greenhouse Gas Emissions**, the proposed Project would comply with the CALGreen Code regarding energy conservation and green building standards.

The Draft EIR adequately addresses compliance with CARB's 2022 Scoping Plan, the City of Rialto Climate Adaptation Plan (CAP), and SCAG's RTP/SCS. This comment does not identify any new significant environmental issues or impacts that were not already addressed in the Draft EIR. The Draft EIR's analysis is adequate, and no revisions are required.

Response A8-7

The commenter opines that there is other feasible measures to mitigate greenhouse gas emission impacts. Refer to Response A8-4.

Response A8-8

The commenter asserts that the Project's total GHG emissions over a 30-year lifespan should be calculated as a starting point for considering additional mitigation or carbon offsets. The commenter's suggestion to evaluate the Project's GHG emissions over a 30-year operational lifespan is inconsistent with SCAQMD's recommended CEQA methodology. SCAQMD thresholds are based on annual GHG emissions, not total emissions over a project's speculative lifespan. The 30-year period referenced in the Draft EIR is used to amortize construction emissions for comparison to annual thresholds, consistent with the published SCAQMD methodology available at the time of Draft EIR publication.[4] Therefore, calculating or evaluating a Project's arbitrary lifetime GHG emissions would be inconsistent with SCAQMD guidance and unnecessary under CEQA. Refer to Response A8-4 regarding carbon offsets.

[4] South Coast Air Quality Management District (SCAQMD), *Draft Guidance Document – Interim CEQA Greenhouse Gas (GHG) Significance Threshold*, https://www.aqmd.gov/docs/default-source/ceqa/handbook/greenhouse-gases-(ghg)-ceqa-significance-thresholds/ghgattachmente.pdf, accessed November 6, 2025.

Response A8-9

The commenter opines that there is other feasible measures to mitigate greenhouse gas emission impacts. Refer to Response A8-4 and Response A5-49.

Response A8-10

The commenter opines that the City did not identify why carbon offsets are not feasible. Refer to Response A8-4.

Response A8-11

The comment suggests the Draft EIR should be revised to include all feasible GHG mitigation measures and claims the Project would not be consistent with all applicable plans, policies, and regulations for reducing GHG emissions. Refer to Response A8-4 and Response A5-49 regarding all feasible GHG mitigation measures. No revisions to the EIR are required.

3.0 ERRATA TO THE EIR

3.1 INTRODUCTION TO THE ERRATA

The Draft EIR for the Locust Gateway Development Project, is hereby incorporated by reference as part of the Final EIR. Changes to the EIR are further detailed below.

The changes to the EIR do not affect the overall conclusions of the environmental document, and instead represent changes to the EIR to provide clarification, amplification and/or insignificant modifications, as needed as a result of public comments on the Draft EIR, or due to additional information received during the public review period. These clarifications and corrections do not warrant Draft EIR recirculation pursuant to CEQA Guidelines Section 15088.5.

None of the changes or information provided in the comments reflect a new significant environmental impact, a substantial increase in the severity of an environmental impact for which mitigation is not proposed, or a new feasible alternative or mitigation measure that would clearly lessen significant environmental impacts but is not adopted. In addition, the changes do not reflect a fundamentally flawed or conclusory EIR.

Changes to the EIR are listed by Section, page, paragraph, etc. to best guide the reader to the revision. Changes are identified as follows:

- Deletions are indicated by ~~strikeout text~~.
- Additions are indicated by <u>underlined text.</u>

3.2 CHANGES TO THE EIR

The following additions/revisions to Mitigation Measures (MM) AQ-3, BIO-1, BIO-3B, BIO-4B, BIO-4C, and CUL-5 will be added to Table 1-1: Summary of Impacts and Mitigation Program, in **Section 1.0: Executive Summary** of the EIR.

Page 1-8, MM AQ-3 has been revised in Table 1-1: Summary of Impacts and Mitigation Program as follows:

Table 1-1: Summary of Impacts and Mitigation Program			
Thresholds	**Level of Significance Before Mitigation**	**Standard Conditions; Mitigation Measures; Laws, Ordinances and Regulations**	**Level of Significance after Mitigation**
Section 4.2: Air Quality			
Impact 4.2-1: Would the Project conflict with or obstruct implementation of the applicable air quality plan?	Potentially Significant Impact	**MM AQ-3: Electric Landscape Equipment**. Prior to the issuance of occupancy permits, the Planning Division shall confirm that the Project's ~~Codes~~ Covenants, Conditions and Restrictions (CC&Rs) and/or tenant lease agreements include contractual language that all handheld landscaping equipment used on site shall be 100 percent electrically powered. The logistics warehouse and parking lots shall be equipped with exterior electrical outlets to accommodate this requirement. This requirement shall be included in the third-party vendor agreements for landscape services for the building owner and tenants, as applicable. This mitigation measure applies only to tenant improvements and not the building shell approvals.	Less than Significant Impact with Mitigation

Section 1.0: Executive Summary, MM BIO-1, MM BIO-3B, MM BIO-4B, and MM BIO-4C has been revised in Table 1-1: Summary of Impacts and Mitigation Program as follows:

Table 1-1: Summary of Impacts and Mitigation Program			
Thresholds	**Level of Significance Before Mitigation**	Standard Conditions; Mitigation Measures; Laws, Ordinances and Regulations	**Level of Significance after Mitigation**
Section 4.3: Biological Resources			
Impact 4.3-1: Would the Project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS?	Potentially Significant Impact	**MM BIO-1: Rare Plant Mitigation Plan**. Parry's spineflower (CRPR 1B.1) is present on site and impacts are unavoidable; therefore, compensatory mitigation shall be provided to offset impacts. A rare plant mitigation plan shall be prepared and implemented by the applicant or its designee prior to the onset of grading activities. The plan will demonstrate the feasibility of conserving, enhancing, or restoring Parry's spineflower habitat in areas to be managed as natural open space without conflicting with other resource management objectives. Habitat conservation,	Less than Significant Impact with Mitigation

Table 1-1: Summary of Impacts and Mitigation Program			
Thresholds	**Level of Significance Before Mitigation**	Standard Conditions; Mitigation Measures; Laws, Ordinances and Regulations	**Level of Significance after Mitigation**
		enhancement, or restoration will be at a minimum 1:1 ratio (acres conserved, enhanced, or restored to acres impacted). If the rare plant mitigation plan proposes conservation of an extant population, the plan shall include at a minimum: (a) the location of the conserved habitat and an analysis of its suitability as compensatory mitigation; (b) an assessment of the extant Parry's spineflower populations at the proposed conservation site; (c) a long-term management plan which includes objectives, management practices, monitoring protocols, adaptive management strategies, and reporting requirements; and (d) details regarding the establishment of a non-wasting endowment to perpetually fund management of the conserved land, or such other funding mechanism acceptable to CDFW. If the rare plant mitigation plan proposes enhancement or restoration, the plan shall include at minimum: (a) collection/salvage measures for plants or seed banks, to retain intact soil conditions and maximize success likelihood; (b) details regarding storage of plants or seed banks; (c) location of the proposed recipient site, and detailed site preparation and plant introduction techniques details for top soil storage, as applicable; (d) time of year that the salvage and replanting or seeding will occur and the methodology of the replanting; (e) a description of the irrigation, if used; (f) success criteria; and (g) a detailed monitoring program, commensurate with the plan's goals. **MM BIO-3B: Burrowing Owl Plan or CESA ITP ~~Preconstruction Surveys.~~** If burrowing owls, active burrows, or signs thereof are confirmed during any survey or biological monitoring, project activities with the potential to impact burrowing owls shall be immediately halted. The qualified biologist shall coordinate with CDFW and prepare a Burrowing Owl Plan that shall be submitted to CDFW for review and approval prior to commencing ~~project activities~~ on-site grading with the potential to impact burrowing	

Table 1-1: Summary of Impacts and Mitigation Program			
Thresholds	**Level of Significance Before Mitigation**	Standard Conditions; Mitigation Measures; Laws, Ordinances and Regulations	**Level of Significance after Mitigation**
		owl. The Burrowing Owl Plan shall describe proposed avoidance, and monitoring actions. The Burrowing Owl Plan shall include the number and location of occupied burrow sites, acres of burrowing owl habitat that will be impacted, details of site monitoring, and details on proposed buffers and other avoidance measures if avoidance is proposed. Project activities with the potential to impact burrowing owls shall not occur within 500 feet of an active burrow until CDFW approves the Burrowing Owl Plan. If project activities, including occupied burrow exclusion and closure, could result in take of burrowing owl, the applicant shall coordinate with CDFW for appropriate CESA authorization (i.e., ITP under CFGC section 2081) prior to commencement of ~~project activities~~ on-site grading with the potential to impact burrowing owl. The ITP shall describe, at a minimum, project activities and equipment, proposed avoidance/buffers, temporary and permanent impacts, monitoring, relocation and/or translocation, and minimization and compensatory mitigation actions. ITP compensatory mitigation will be fulfilled by one or more of following options: 1) purchase of credits at a CDFW-approved conservation or mitigation bank (if available); 2) execution of a Mitigation Credit Agreement; or 3) Permittee-responsible mitigation land acquisition. The conditions of the permit or measures outlined in the plan shall be adhered to by the applicant and any required compensatory mitigation of habitat would be provided. **MM BIO-4B: Crotch's Bumble Bee CESA ITP.** Suitable Crotch's bumble bee habitat and Crotch's bumble bee presence has been confirmed on the site; therefore, a CESA ITP shall be applied for and obtained prior to the commencement of ~~project activities~~ on-site grading with the potential to impact Crotch's bumble bee. The ITP shall include, at a minimum, a description of project activities and equipment, proposed avoidance/buffers, identification of	

Table 1-1: Summary of Impacts and Mitigation Program			
Thresholds	**Level of Significance Before Mitigation**	Standard Conditions; Mitigation Measures; Laws, Ordinances and Regulations	**Level of Significance after Mitigation**
		temporary and permanent impacts, monitoring requirements, relocation and/or translocation protocols, and compensatory mitigation measures. Compensatory mitigation will be at a minimum 1:1 ratio (acres conserved, enhanced, or restored to acres impacted). ITP compensatory mitigation shall be satisfied by one or more of the following mechanisms: 1) purchase of credits at a CDFW-approved conservation or mitigation bank (if available); 2) execution of a Mitigation Credit Agreement; or 3) Permittee-responsible mitigation land acquisition. **MM BIO-4C: Crotch's Bumble Bee Biological Monitor.** A qualified biological monitor shall conduct full-time monitoring during removal of suitable nectar plants that is scheduled to occur during the queen flight period (February through March), colony active period (~~March~~ April through ~~September~~ August), and/or gyne flight period (September through October). The monitor shall have authority to temporarily halt or redirect activities as needed to avoid unauthorized impacts.	

Section 1.0: Executive Summary, MM CUL-5 has been revised in Table 1-1: Summary of Impacts and Mitigation Program as follows:

Table 1-1: Summary of Impacts and Mitigation Program			
Thresholds	**Level of Significance Before Mitigation**	**Standard Conditions; Mitigation Measures; Laws, Ordinances and Regulations**	**Level of Significance after Mitigation**
Section 4.4: Cultural Resources			
Impact 4.4-1: Would the Project cause a substantial adverse change in the significance of a historical resource pursuant to Section 15064.5?	Potentially Significant Impact	**MM CUL-5: Inadvertent Discovery of Cultural Resources.** In the event that cultural resources are discovered during Project implementation, all earthwork and ground-disturbing activities shall halt within a buffer of the discovery established by the Project Archaeologist and the Project Archaeologist shall assess the nature and significance of the find. The Project Archaeologist shall coordinate with the City and identify whether the resource is potentially significant and if it requires further evaluation. Work	Less than Significant Impact with Mitigation

Table 1-1: Summary of Impacts and Mitigation Program			
Thresholds	**Level of Significance Before Mitigation**	**Standard Conditions; Mitigation Measures; Laws, Ordinances and Regulations**	**Level of Significance after Mitigation**
		on the other portions of the project site outside of the buffered area may continue during this assessment period. If the cultural resources are Native American in origin, the Consulting Tribes must be immediately contacted and consulted regarding potential significance and treatment of the resource. Specifically, the Consulting Tribes shall be contacted, as detailed within Tribal Cultural Resources (TCR) Mitigation Measure 3, regarding any pre-contact finds and shall be provided information after the Project Archaeologist makes his/her initial assessment of the nature of the find, so as to provide Tribal input with regard to significance and treatment. For any potential significant cultural resources, the Project Archaeologist shall make recommendations to the City to avoid or mitigate impacts to the resource. If significant pre-contact cultural resources, as defined by CEQA, are discovered and avoidance cannot be ensured, the archaeologist shall develop a Monitoring and Treatment Plan, the drafts of which shall be provided to the Consulting Tribes for review and comment, as detailed within TCR-1. The Project Archaeologist shall monitor the remainder of the project and implement the Monitoring and Treatment Plan accordingly. Preservation in place (i.e. avoidance) is the preferred manner of treatment. If preservation in place is not feasible, treatment may include implementation of archaeological data recovery to excavate the resource along with subsequent laboratory processing and analysis. Disposition of significant Native American archaeological materials, such as reburial or curation by a qualified repository within San Bernardino County, shall be agreed upon by the City and Consulting Tribes. Any significant non-Native American archaeological material shall be curated at a public, non-profit institution with a research interest in the materials within San Bernardino County, if such an institution agrees to accept the material. If no institution accepts the archaeological material, it shall be offered to a local school or historical society in the area	

Table 1-1: Summary of Impacts and Mitigation Program			
Thresholds	**Level of Significance Before Mitigation**	**Standard Conditions; Mitigation Measures; Laws, Ordinances and Regulations**	**Level of Significance after Mitigation**
		for educational purposes. All identified cultural resources shall be recorded on appropriate California Department of Parks and Recreation (CA DPR 523) series forms and evaluated for significance. All findings shall be included within a Monitoring Report drafted by the Project Archaeologist and submitted to the City and Consulting Tribes for review. Final copies of the Monitoring Report shall be submitted to the City, Consulting Tribes, and South Central Coastal Information Center (SCCIC).	

Section 4.2: Air Quality

Page 4.2-35, MM AQ-3 has been revised and is incorporated into the Final EIR as follows:

MM AQ-3 **Electric Landscape Equipment**. Prior to the issuance of occupancy permits, the Planning Division shall confirm that the Project's ~~Codes~~ Covenants, Conditions and Restrictions (CC&Rs) and/or tenant lease agreements include contractual language that all handheld landscaping equipment used on site shall be 100 percent electrically powered. The logistics warehouse and parking lots shall be equipped with exterior electrical outlets to accommodate this requirement. This requirement shall be included in the third-party vendor agreements for landscape services for the building owner and tenants, as applicable. This mitigation measure applies only to tenant improvements and not the building shell approvals.

Section 4.3: Biological Resources

Page 4.3-25 through 4.3-28, MM BIO-1, MM BIO-3B, MM BIO-4B, and MM BIO-4C have been revised and are incorporated into the Final EIR as follows:

MM BIO-1 **Rare Plant Mitigation Plan.** Parry's spineflower (CRPR 1B.1) is present on site and impacts are unavoidable; therefore, compensatory mitigation shall be provided to offset impacts. A rare plant mitigation plan shall be prepared and implemented by the applicant or its designee prior to the onset of grading activities. The plan will demonstrate the feasibility of conserving, enhancing, or restoring Parry's spineflower habitat in areas to be managed as natural open space without conflicting with other resource management objectives. Habitat conservation, enhancement, or restoration will be at a minimum 1:1 ratio (acres conserved, enhanced, or restored to acres impacted).

If the rare plant mitigation plan proposes conservation of an extant population, the plan shall include at a minimum: (a) the location of the conserved habitat and an analysis of its suitability as compensatory mitigation; (b) an assessment of the extant Parry's spineflower populations at the proposed conservation site; (c) a long-term management plan which includes objectives, management practices, monitoring protocols, adaptive management strategies, and reporting requirements; and (d) details regarding the establishment of a non-wasting endowment to perpetually fund management of the conserved land, or such other funding mechanism acceptable to CDFW.

If the rare plant mitigation plan proposes enhancement or restoration, the plan shall include at minimum: (a) collection/salvage measures for plants or seed banks, to retain intact soil conditions and maximize success likelihood; (b) details regarding storage of plants or seed banks; (c) location of the proposed recipient site, and detailed site preparation and plant introduction techniques details for top soil storage, as applicable; (d) time of year that the salvage and replanting or seeding will occur and the methodology of the replanting; (e) a description of the irrigation, if used; (f) success criteria; and (g) a detailed monitoring program, commensurate with the plan's goals.

MM BIO-3B **Burrowing Owl Plan or CESA ITP ~~Preconstruction Surveys~~.** If burrowing owls, active burrows, or signs thereof are confirmed during any survey or biological monitoring, project activities with the potential to impact burrowing owl shall be immediately halted.

The qualified biologist shall coordinate with CDFW and prepare a Burrowing Owl Plan that shall be submitted to CDFW for review and approval prior to commencing on-site grading ~~project activities~~ with the potential to impact burrowing owl. The Burrowing Owl Plan shall describe proposed avoidance, and monitoring actions. The Burrowing Owl Plan shall include the number and location of occupied burrow sites, acres of burrowing owl habitat that will be impacted, details of site monitoring, and details on proposed buffers and other avoidance measures if avoidance is proposed. Project activities with the potential to impact burrowing owl shall not occur within 500 feet of an active burrow until CDFW approves the Burrowing Owl Plan.

If project activities, including occupied burrow exclusion and closure, could result in take of burrowing owl, the applicant shall coordinate with CDFW for appropriate CESA authorization (i.e., ITP under CFGC section 2081) prior to commencement of on-site grading ~~project activities~~ with the potential to impact burrowing owl. The ITP shall describe, at a minimum, project activities and equipment, proposed avoidance/buffers, temporary and permanent impacts, monitoring, relocation and/or translocation, and minimization and compensatory mitigation actions. ITP compensatory mitigation will be fulfilled by one or more of following options: 1) purchase of credits at a CDFW-approved conservation or mitigation bank (if available); 2) execution of a Mitigation Credit Agreement; or 3) Permittee-responsible mitigation land acquisition.

The conditions of the permit or measures outlined in the plan shall be adhered to by the applicant and any required compensatory mitigation of habitat would be provided.

MM BIO-4B **Crotch's Bumble Bee CESA ITP.** Suitable Crotch's bumble bee habitat and Crotch's bumble bee presence has been confirmed on the site; therefore, a CESA ITP shall be applied for and obtained prior to the commencement of on-site grading ~~project activities~~ with the potential to impact Crotch's bumble bee. The ITP shall include, at a minimum, a description of project activities and equipment, proposed avoidance/buffers, identification of temporary and permanent impacts, monitoring requirements, relocation and/or translocation protocols, and compensatory mitigation measures. Compensatory mitigation will be at a minimum 1:1 ratio (acres conserved, enhanced, or restored to acres impacted). ITP compensatory mitigation shall be satisfied by one or more of the following mechanisms: 1) purchase of credits at a CDFW-approved conservation or mitigation bank (if available); 2) execution of a Mitigation Credit Agreement; or 3) Permittee-responsible mitigation land acquisition.

MM BIO-4C **Crotch's Bumble Bee Biological Monitor.** A qualified biological monitor shall conduct full-time monitoring during removal of suitable nectar plants that is scheduled to occur during the queen flight period (February through March), colony active period (~~March~~ April through ~~September~~ August), and/or gyne flight period (September through October). The monitor shall have authority to temporarily halt or redirect activities as needed to avoid unauthorized impacts.

Section 4.4: Cultural Resources

Page 4.4-11 through 4.4-12, MM CUL-5 has been revised and is incorporated into the Final EIR as follows:

MM CUL-5 **Inadvertent Discovery of Cultural Resources.** In the event that cultural resources are discovered during Project implementation, all earthwork and ground-disturbing activities shall halt within a buffer of the discovery established by the Project Archaeologist and the Project Archaeologist shall assess the nature and significance of the find. The Project Archaeologist shall coordinate with the City and identify whether the resource is potentially significant and if it requires further evaluation. Work on the other portions of the project site outside of the buffered area may continue during this assessment period. If the cultural resources are Native American in origin, the Consulting Tribes must be immediately contacted and consulted regarding potential significance and treatment of the resource. Specifically, the Consulting Tribes shall be contacted, as detailed within Tribal Cultural Resources (TCR) Mitigation Measure 3, regarding any pre-contact finds and shall be provided information after the Project Archaeologist makes his/her initial assessment of the nature of the find, so as to provide Tribal input with regard to significance and treatment. For any potential significant cultural resources, the Project Archaeologist shall make recommendations to the City to avoid or mitigate impacts to the resource. If significant pre-contact cultural resources, as defined by CEQA, are discovered and avoidance cannot be ensured, the archaeologist shall develop a Monitoring and Treatment Plan, the drafts of which shall be provided to the Consulting Tribes for review and comment, as detailed within TCR-1. The Project Archaeologist shall monitor the remainder of the project and implement the Monitoring and Treatment Plan accordingly. Preservation in place (i.e. avoidance) is the preferred manner of treatment. If preservation in place is not feasible, treatment may include implementation of archaeological data recovery to excavate the resource along with subsequent laboratory processing and analysis.

Disposition of significant Native American archaeological materials, such as reburial or curation by a qualified repository within San Bernardino County, shall be agreed upon by the City and Consulting Tribes. Any significant non-Native American archaeological material shall be curated at a public, non-profit institution with a research interest in the materials within San Bernardino County, if such an institution agrees to accept the material. If no institution accepts the archaeological material, it shall be offered to a local school or historical society in the area for educational purposes. All identified cultural resources shall be recorded on appropriate California Department of Parks and Recreation (CA DPR 523) series forms and evaluated for significance. All findings shall be included within a Monitoring Report drafted by the Project Archaeologist and submitted to the City and Consulting Tribes for review. Final copies of the Monitoring Report shall be submitted to the City, Consulting Tribes, and South Central Coastal Information Center (SCCIC).

Section 4.7: Greenhouse Gas Emissions

Page 4.7-26, last sentence of the second paragraph of Section 4.7.7 has been revised and is incorporated into the Final EIR as follows:

> As such, the Project would cumulatively contribute to a significant and unavoidable GHG impact.

Section 4.8: Hazards and Hazardous Materials

Page 4.8-21, last sentence of first paragraph has been revised and is incorporated into the Final EIR as follows:

> Therefore, although the project site is located within the RFF Superfund site, based on the Phase II ESA findings and compliance with MM HAZ-2 through MM HAZ-4, ~~Project~~ implementation of the Project would not create a significant hazard to the public or the environment and impacts would be reduced to a less than significant level.

Appendix C Health Risk Assessment

Page 20, the first paragraph has been revised and is incorporated into the Final EIR as follows:

> To estimate the cancer risk, the dose is multiplied by the cancer potency factor, the ASF, the exposure duration divided by averaging time, and the frequency of time spent at home (for residents only):
>
> $$Risk_{inh\text{-}res} = (Dose_{air} * CPF * ASF * (ED/AT) * FAH)$$
>
> $Risk_{inh\text{-}res}$ = residential inhalation cancer risk (potential chances per million)
> $Dose_{air}$ = daily dose through inhalation (mg/kg-day)
> CPF = inhalation cancer potency factor ($mg/kg\text{-}day^{-1}$)
> ASF = age sensitivity factor for a specified age group (unitless)
> ED = exposure duration (years)
> AT = averaging time of lifetime cancer risk (years)
> FAH = fraction of time spent at home (unitless)

4.0 MITIGATION MONITORING AND REPORTING PROGRAM

4.1 PURPOSE OF MITIGATION MONITORING AND REPORTING PROGRAM

The California Environmental Quality Act (CEQA) requires that all public agencies establish monitoring and/or reporting procedures for mitigation adopted as conditions of approval in order to mitigate or avoid significant environmental impacts. This Mitigation Monitoring and Reporting Program (MMRP) has been developed to provide a vehicle by which to monitor the Mitigation Program outlined in the Locust Gateway Development Project Final Environmental Impact Report (EIR), State Clearinghouse No. 2024061274. The MMRP has been prepared in conformance with Section 21081.6 of the Public Resources Code. Specifically, Section 21081.6 states:

(a) When making findings required by paragraph (1) of subdivision (a) of Section 21081 or when adopting a mitigated negative declaration pursuant to paragraph (2) of subdivision (c) of Section 21080, the following requirements shall apply:

(1) The public agency shall adopt a reporting or monitoring program for the changes made to the project or conditions of project approval, adopted in order to mitigate or avoid significant effects on the environment. The reporting or monitoring program shall be designed to ensure compliance during project implementation. For those changes which have been required or incorporated into the project at the request of a responsible agency or a public agency having jurisdiction by law over natural resources affected by the project, that agency shall, if so requested by the lead or responsible agency, prepare and submit a proposed reporting or monitoring program.

(2) The lead agency shall specify the location and custodian of the documents or other material which constitute the record of proceedings upon which its decision is based.

CEQA Guidelines Section 15097 provides clarification of mitigation monitoring and reporting requirements and guidance to local lead agencies on implementing strategies. The reporting or monitoring program must be designed to ensure compliance during project implementation. The City of Rialto is the Lead Agency for the Project and is therefore responsible for ensuring the implementation of the MMRP. The MMRP has been drafted to meet the requirements of Public Resources Code Section 21081.6 as a fully enforceable monitoring program.

4.2 ORGANIZATION

The Mitigation Program identified in the EIR outlines the standard conditions of approval and mitigation measures for which implementation of the Project would be consistent with.

The MMRP defines the following for each Mitigation Program element:

- **Definition.** The Mitigation Program element contains the criteria for mitigation, either in the form of adherence to certain adopted regulations or identification of the steps to be taken in mitigation.

- **Time Frame.** In each case, a time frame is provided for performance of the mitigation or the review of evidence that mitigation has taken place. The performance points selected are designed to ensure that impact-related components of Project implementation do not proceed without establishing that the mitigation is implemented or ensured. All activities are subject to the approval of all required permits from agencies with permitting authority over the specific activity.
- **Monitoring/Reporting Method.** The actions required to ensure the measure is implemented are noted.
- **Responsible Party or Designated Representative.** Unless otherwise indicated, an applicant would be the party responsible for implementing the mitigation, and the City of Rialto or designated representative would be responsible for monitoring the performance and implementation of the mitigation measure. To guarantee that the mitigation will not be inadvertently overlooked, a supervising public official acting as the Designated Representative is the official who grants the permit or authorization called for in the performance. Where more than one official is identified, permits or authorization from all officials shall be required.

The last column of the MMRP table will be used by the parties responsible for documenting when implementation of the measure has been completed. The ongoing documentation and monitoring of mitigation compliance will be completed by the City of Rialto. The completed MMRP and supplemental documents will be kept on file at the City of Rialto Community Development Department.

Locust Gateway Development Project Mitigation Monitoring and Reporting Program					
Standard Conditions; Mitigation Measures; Laws, Ordinances and Regulations	**Implementation Timing**	**Monitoring/Reporting Method**	**Responsible Party for Implementation/ Approval**	**Verification**	
				Date	**Initials**
Air Quality					
Laws, Ordinances, and Regulations (LORs) are existing requirements that are based on local, State, or federal regulations or laws that are frequently required independently of CEQA review. **LOR AQ-1.** Prior to the issuance of grading permits, the City Engineer shall confirm that the Grading Plan, Building Plans and Specifications require all construction contractors to comply with South Coast Air Quality Management District's (SCAQMD) Rules 402 and 403 to minimize construction emissions of dust and particulates. The measures include, but are not limited to, the following: ▪ Portions of a construction site to remain inactive longer than a period of three months will be seeded and watered until grass cover is grown or otherwise stabilized. ▪ All on-site roads will be paved as soon as feasible or watered periodically or chemically stabilized. ▪ All material transported off site will be either sufficiently watered or securely covered to prevent excessive amounts of dust. ▪ The area disturbed by clearing, grading, earthmoving, or excavation operations will be minimized at all times. ▪ Where vehicles leave a construction site and enter adjacent public streets, the streets will be swept daily or washed down at the end of the workday to remove soil tracked onto the paved surface.	Prior to the issuance of grading permits	On-site inspections	City of Rialto Public Works Department, Engineering Services		
LOR AQ-2. Require diesel powered construction equipment to turn off when not in use per Title 13 of the California Code of Regulations, Section 2449.	Ongoing during construction	On-site inspections	City of Rialto Public Works Department, Engineering Services		
LOR AQ-3. Install water-efficient irrigation systems and devices, such as soil moisture-based irrigation controls and sensors for landscaping according to the City's Water Efficient Landscape requirements (Chapter 12.50 of the City's Municipal Code).	Prior to Issuance of Occupancy Permit	Documentation of Low Water Use Landscaping	City of Rialto Community Development Department, Planning Division		
LOR AQ-4. In accordance with California Title 24 Standards, buildings will be designed to have 15 percent of the roof area "solar ready" that will structurally accommodate later installation of rooftop solar panels. If future building operators pursue providing rooftop solar panels, they will submit plans for solar panels prior to occupancy.	Condition of issuance of Building Permit	On-site inspections	City of Rialto Community Development Department, Building and Safety Division

LOR AQ-5. The Project shall be designed in accordance with the applicable California Green Building Standards (CALGreen) Code (24 CCR, Part 11). The Building Official, or designee shall ensure compliance prior to the issuance of each building permit. These requirements include, but are not limited to: ▪ Design buildings to be water efficient. Install water-efficient fixtures in accordance with Section 5.303 of the California Green Building Standards Code Part 11. ▪ Recycle and/or salvage for reuse a minimum of 65 percent of the nonhazardous construction and demolition waste in accordance with Section 5.408.1 of the California Green Building Standards Code Part 11. ▪ Provide storage areas for recyclables and green waste and adequate recycling containers located in readily accessible areas in accordance with Section 5.410 of the California Green Building Standards Code Part 11. ▪ To facilitate future installation of electric vehicle supply equipment (EVSE), nonresidential construction shall comply with Section 5.106.5.3 (nonresidential electric vehicle charging) of the California Green Building Standards Code Part 11.	Condition of issuance of Building Permit Prior to issuance of Occupancy Permit	On-site inspections	City of Rialto Community Development Department, Building and Safety Division		
MM AQ-1: Low VOC Paints. The Project shall use "Super-Compliant" low VOC paints which have been reformulated to exceed the regulatory VOC limits (i.e., have a lower VOC content than what is required) put forth by SCAQMD's Rule 1113 for all architectural coatings. Super-Compliant low VOC paints shall be no more than 10 g/L of VOC. Prior to issuance of a building permit, the City shall confirm that plans include the following specifications: ▪ All architectural coatings will be super-compliant low VOC paints. ▪ Recycle leftover paint. Take any leftover paint to a household hazardous waste center; do not mix leftover water-based and oil-based paints. ▪ Keep lids closed on all paint containers when not in use to prevent VOC emissions and excessive odors. ▪ For water-based paints, clean up with water only. Whenever possible, do not rinse the cleanup water down the drain or pour it directly into the ground or the storm drain. Set aside the can of cleanup water and take it to the hazardous waste center (www.cleanup.org). ▪ Use compliant low-VOC cleaning solvents to clean paint application equipment.	Prior to issuance of a Building Permit	Confirm compliance during on-site inspections	City of Rialto Community Development Department, Building and Safety Division		

Locust Gateway Development Project Mitigation Monitoring and Reporting Program					
Standard Conditions; Mitigation Measures; Laws, Ordinances and Regulations	**Implementation Timing**	**Monitoring/Reporting Method**	**Responsible Party for Implementation/ Approval**	**Verification**	
				Date	**Initials**
▪ Keep all paint- and solvent-laden rags in sealed containers to prevent VOC emissions. ▪ Contractors shall construct/build with materials that do not require painting and use pre-painted construction materials to the extent practicable. ▪ Use high-pressure/low-volume paint applicators with a minimum transfer efficiency of at least 50 percent or other application techniques with equivalent or higher transfer efficiency.					
MM AQ-2: Require All-Electric Development. Prior to the issuance of building permits, the Building Department shall confirm that building plans require the Project to use all-electric appliances, and end uses instead of natural gas. The Project shall not include natural gas utility lines or connections. The purpose of this mitigation measure is to reduce air quality emissions from natural gas.	Prior to the issuance of Building Permits	Approval of Plans and Specifications	City of Rialto Community Development Department, Building and Safety Division		
MM AQ-3: Electric Landscape Equipment. Prior to the issuance of occupancy permits, the Planning Division shall confirm that the Project's Covenants, Conditions and Restrictions (CC&Rs) and/or tenant lease agreements include contractual language that all handheld landscaping equipment used on site shall be 100 percent electrically powered. The logistics warehouse and parking lots shall be equipped with exterior electrical outlets to accommodate this requirement. This requirement shall be included in the third-party vendor agreements for landscape services for the building owner and tenants, as applicable. This mitigation measure applies only to tenant improvements and not the building shell approvals.	Prior to the issuance of Occupancy Permits	Approval of Plans and Specifications	City of Rialto Community Development Department, Planning Division		
MM AQ-4: Transportation Demand Management: Prior to issuance of tenant occupancy permits, the tenant/facility operator shall prepare and submit a Transportation Demand Management (TDM) program detailing strategies that would reduce the use of single occupant vehicles by employees by increasing the number of trips by walking, bicycle, carpool, vanpool and transit. The TDM shall include measures such as, but not limited to the following: ▪ Provide a transportation information center and on-site TDM coordinator to educate residents, employers, employees, and visitors of surrounding transportation options.	Prior to the issuance of tenant occupancy permits.	Approval of Plans and Specifications	Tenant/Facility Operator		

Locust Gateway Development Project Mitigation Monitoring and Reporting Program

				Date	**Initials**
▪ Promote bicycling and walking through design features such as showers for employees, self-service bicycle repair area, etc. around the Project site. ▪ Each building shall provide secure bicycle storage space equivalent to two percent of the automobile parking spaces provided. ▪ Each building shall provide a minimum of two shower and changing facilities as part of the tenant improvements. ▪ Provide on-site car share amenities for employees who make only occasional use of a vehicle, as well as others who would like occasional access to a vehicle of a different type than they use day-to-day. ▪ Promote and support carpool/vanpool/rideshare use through parking incentives and administrative support, such as ride-matching service. ▪ Incorporate incentives for using alternative travel modes, such as preferential load/unload areas or convenient designated parking spaces for carpool/vanpool users. ▪ Provide meal options on site or shuttles between the facility and nearby meal destinations. ▪ Each building shall provide preferred parking for electric, low-emitting and fuel-efficient vehicles equivalent to at least eight percent of the required number of parking spaces. ▪ This mitigation measure applies only to tenant occupancy and not the building shell approvals.					
MM AQ-5: Non-Diesel Cargo Handling Equipment. The warehouse building shall include the necessary charging stations for cargo handling equipment. Prior to the issuance of a tenant occupancy permit, the Planning Division shall confirm that the Project plans and specifications show that all outdoor cargo handling equipment (including yard trucks, hostlers, yard goats, pallet jacks, and forklifts) are zero emission or alternatively fueled (i.e., powered by electricity or non-diesel fuels). The building manager or their designee shall be responsible for enforcing these requirements. Note that SCAQMD Rule 2305 (Warehouse Indirect Source Rule) Warehouse Actions and Investments to Reduce Emissions (WAIRE) points may be earned for electric/zero emission yard truck/hostler usage. This mitigation measure applies only to tenant improvements and not the building shell approvals.	Prior to the issuance of tenant occupancy permits.	Approval of Plans and Specifications	City of Rialto Community Development Department, Planning Division

				Date	**Initials**
Biological Resources					
MM BIO-1: Rare Plant Mitigation Plan. Parry's spineflower (CRPR 1B.1) is present on site and impacts are unavoidable; therefore, compensatory mitigation shall be provided to offset impacts. A rare plant mitigation plan shall be prepared and implemented by the applicant or its designee prior to the onset of grading activities. The plan will demonstrate the feasibility of conserving, enhancing, or restoring Parry's spineflower habitat in areas to be managed as natural open space without conflicting with other resource management objectives. Habitat conservation, enhancement, or restoration will be at a minimum 1:1 ratio (acres conserved, enhanced, or restored to acres impacted). If the rare plant mitigation plan proposes conservation of an extant population, the plan shall include at a minimum: (a) the location of the conserved habitat and an analysis of its suitability as compensatory mitigation; (b) an assessment of the extant Parry's spineflower populations at the proposed conservation site; (c) a long-term management plan which includes objectives, management practices, monitoring protocols, adaptive management strategies, and reporting requirements; and (d) details regarding the establishment of a non-wasting endowment to perpetually fund management of the conserved land, or such other funding mechanism acceptable to CDFW. If the rare plant mitigation plan proposes enhancement or restoration, the plan shall include at minimum: (a) collection/salvage measures for plants or seed banks, to retain intact soil conditions and maximize success likelihood; (b) details regarding storage of plants or seed banks; (c) location of the proposed recipient site, and detailed site preparation and plant introduction techniques details for top soil storage, as applicable; (d) time of year that the salvage and replanting or seeding will occur and the methodology of the replanting; (e) a description of the irrigation, if used; (f) success criteria; and (g) a detailed monitoring program, commensurate with the plan's goals.	Prior to the onset of grading activities.	Verify Pre-Construction Surveys Conducted. Field Inspection signoff, and compliance report by Qualified Biologist.	Qualified Biologist City of Rialto Community Development Department, Planning Division		
MM BIO-2: Best Management Practices. To avoid impacts to special-status resources and inadvertent disturbance, the following monitoring requirements and Best Management Practices (BMPs) shall be implemented:	Prior to initial ground disturbing activities. Ongoing during grading and construction	Verify Pre-Construction Surveys Conducted. Field Inspection signoff, and	Qualified Biologist

a. Construction vehicles shall not exceed 15 miles per hour on unpaved roads adjacent to the project site or the right-of-way accessing the site. b. The Applicant, or its contractors, shall screen, cover, or elevate at least one foot above ground, all construction pipe, culverts, or similar structures with a diameter of three inches or greater that are stored on site overnight. These pipes, culverts, and similar structures shall be inspected by the Project biologist for wildlife before such material is moved, buried, or capped. c. Construction activities shall occur during daytime hours to the greatest extent feasible. If construction must occur at nighttime, lights shall be oriented in such a way that they direct light downward and toward the active construction, ensuring that no direct light is emitted towards adjacent lands, and shields or deflectors shall be installed on lights to reduce light spill. Nighttime concrete pouring shall be performed in accordance with the City of Rialto Municipal Code. d. A biologist shall flush special-status species (i.e., avian or other mobile species), with the exception of burrowing owls, from suitable habitat areas within the Project development footprint to the maximum extent practicable immediately (e.g., within 24 hours) prior to initial vegetation removal activities. The biologist shall flush wildlife by walking through habitats to be imminently removed and towards adjacent open space. e. At the end of each workday during construction, the applicant, or its contractors, shall cover all excavated, steep-sided holes or trenches more than eight inches deep and that have sidewalls steeper than 1:1 (45 degree) slope with plywood or similar materials, or provide a minimum of one escape ramp per 100 feet of trenching (with slopes no greater than 3:1) constructed of earth fill or wooden planks. The applicant, or its contractors shall thoroughly inspect holes and trenches for trapped animals each workday. f. Contractors shall not permit pets on the construction site. g. If trash and debris need to be stored overnight during maintenance activities, fully covered trash receptacles that are animal-proof and weather-proof shall be used by the maintenance contractor to contain all food, food scraps, food wrappers, beverage containers, and other miscellaneous trash. Alternatively, standard trash		compliance report by Qualified Biologist.	City of Rialto Community Development Department, Planning Division

				Date	**Initials**
receptacles may be used during the day but must be removed or emptied each night. h. To prevent inadvertent disturbance to areas outside the limits of work, the construction limits shall be clearly demarcated (e.g., installation of flagging or temporary visibility construction fence) prior to ground-disturbance activities, and all construction activities, including equipment staging and maintenance, shall be conducted within the marked disturbance limits. The work limit delineation shall be maintained throughout Project construction. i. The Applicant, or its contractors, shall avoid the use of invasive plant species in the associated landscaping. j. Prior to initial ground disturbing activities, a Worker Environmental Awareness Program (WEAP) shall be prepared, which will include a training presentation and key fact sheet. The training will instruct construction crews to be aware of and recognize sensitive biological resources that may be encountered within, or adjacent to, the project site. The training will provide workers with instructions to follow in the event a sensitive species is observed or suspected to be on site. Biologists shall provide WEAP training materials, including but not limited to the key fact sheet, to construction personnel before their commencement of work on the Project. Additionally, all construction staff shall attend the WEAP training presentation prior to beginning work on site. Upon completion of the WEAP training, each member of the construction crew shall sign a form stating that they attended the training, understood the information presented, and agreed to comply with the requirements set out in the WEAP training. Biologists shall provide updates relevant to the training to construction personnel during the safety ("tailgate") meetings, as needed.					
MM BIO-3A: Burrowing Owl Preconstruction Surveys. No less than 14 days prior to the onset of construction activities, a qualified biologist shall survey the construction limits of the project site and a 500-foot buffer for the presence of burrowing owls and occupied nest burrows. A second survey shall be conducted within 24 hours prior to the onset of construction activities. Time lapses between Project activities greater than one week (7 days) would trigger subsequent 24-hour take avoidance surveys to confirm burrowing owl absence. The surveys shall be conducted in accordance with	Preconstruction survey conducted no less than 14 days prior to the onset of construction activities Second survey conducted within 24 hours prior to the onset of construction activities.	Verify Pre-Construction Surveys Conducted. Field Inspection signoff, and compliance report by Qualified Biologist.	Qualified Biologist City of Rialto Community Development Department, Planning Division

				Date	**Initials**
the most current CDFW survey methods. If burrowing owls are not observed during clearance surveys or biological monitoring, no additional conditions are required to avoid impacts to burrowing owls. The Project Applicant shall submit at least one burrowing owl pre-construction survey report to the satisfaction of the City to document compliance with this mitigation measure. For the purposes of this measure, 'qualified biologist' is a biologist who meets the requirements set forth in the BUOW Guidelines (CDFW 2012).					
MM BIO-3B: Burrowing Owl Plan or CESA ITP. If burrowing owls, active burrows, or signs thereof are confirmed during any survey or biological monitoring, Project activities with the potential to impact burrowing owls shall be immediately halted. The qualified biologist shall coordinate with CDFW and prepare a Burrowing Owl Plan that shall be submitted to CDFW for review and approval prior to commencing on-site grading with the potential to impact burrowing owl. The Burrowing Owl Plan shall describe proposed avoidance, and monitoring actions. The Burrowing Owl Plan shall include the number and location of occupied burrow sites, acres of burrowing owl habitat that will be impacted, details of site monitoring, and details on proposed buffers and other avoidance measures if avoidance is proposed. Project activities with the potential to impact burrowing owls shall not occur within 500 feet of an active burrow until CDFW approves the Burrowing Owl Plan. If Project activities, including occupied burrow exclusion and closure, could result in take of burrowing owl, the applicant shall coordinate with CDFW for appropriate CESA authorization (i.e., ITP under CFGC section 2081) prior to commencement of on-site grading with the potential to impact burrowing owl. The ITP shall describe, at a minimum, Project activities and equipment, proposed avoidance/buffers, temporary and permanent impacts, monitoring, relocation and/or translocation, and minimization and compensatory mitigation actions. ITP compensatory mitigation will be fulfilled by one or more of following options: 1) purchase of credits at a CDFW-approved conservation or mitigation bank (if available); 2) execution of a Mitigation Credit Agreement; or 3) Permittee-responsible mitigation land acquisition. The conditions of the permit or measures outlined in the plan shall be adhered to by the applicant and any required compensatory mitigation of habitat would be provided.	If burrowing owls are detected during preconstruction surveys	Preparation of Burrowing Owl Plan, if burrowing owls are detected	City of Rialto Community Development Department, Planning Division California Department of Fish and Wildlife (CDFW) Qualified Biologist

				Date	**Initials**
MM BIO-4A: Crotch's Bumble Bee Surveys. At a minimum, two pre-construction nesting surveys shall be conducted prior to Project implementation. Surveys shall occur within 1) one week; and 2) within 24-hours prior to any vegetation removal or ground-disturbing activities scheduled to occur during the Crotch's bumble bee flight season (February through October). Surveys shall follow the guidelines provided in the CDFW's *Survey Considerations for CESA Candidate Bumble Bee Species* (2024b) and shall occur within the project site and areas adjacent to the project site where suitable habitat exists. The surveyors shall be qualified biologists familiar with Crotch's bumble bee identification and life history.	Two pre-construction nesting surveys shall be conducted prior to Project implementation. 1) one week; and 2) within 24-hours prior to any vegetation removal or ground-disturbing activities scheduled to occur during the Crotch's bumble bee flight season (February through October)	Verify Pre-Construction Surveys Conducted. Field Inspection signoff, and compliance report by Qualified Biologist	Qualified Biologist City of Rialto Community Development Department, Planning Division		
MM BIO-4B: Crotch's Bumble Bee CESA ITP. Suitable Crotch's bumble bee habitat and Crotch's bumble bee presence has been confirmed on the site; therefore, a CESA ITP shall be applied for and obtained prior to the commencement of on-site grading with the potential to impact Crotch's bumble bee. The ITP shall include, at a minimum, a description of Project activities and equipment, proposed avoidance/buffers, identification of temporary and permanent impacts, monitoring requirements, relocation and/or translocation protocols, and compensatory mitigation measures. Compensatory mitigation will be at a minimum 1:1 ratio (acres conserved, enhanced, or restored to acres impacted). ITP compensatory mitigation shall be satisfied by one or more of the following mechanisms: 1) purchase of credits at a CDFW-approved conservation or mitigation bank (if available); 2) execution of a Mitigation Credit Agreement; or 3) Permittee-responsible mitigation land acquisition.	CESA ITP shall be applied for and obtained prior to the commencement of on-site grading.	Verify Pre-Construction Surveys Conducted. Field Inspection signoff, and compliance report by Qualified Biologist	City of Rialto Community Development Department, Planning Division California Department of Fish and Wildlife (CDFW) Qualified Biologist		
MM BIO-4C: Crotch's Bumble Bee Biological Monitor. A qualified biological monitor shall conduct full-time monitoring during removal of suitable nectar plants that is scheduled to occur during the queen flight period (February through March), colony active period (April through August), and/or gyne flight period (September through October). The monitor shall have authority to temporarily halt or redirect activities as needed to avoid unauthorized impacts.	Ongoing during removal of suitable nectar plants if conducted February through March, April through August, and/or September through October.	Verify Pre-Construction Surveys Conducted. Field Inspection signoff, and compliance report by Qualified Biologist	Qualified Biologist City of Rialto Community Development Department, Planning Division		
MM BIO-5A: Nesting Bird Surveys. To ensure compliance with California Fish and Game Code Sections 3503, 3503.5, and 3513 and to avoid potential impacts to nesting birds, vegetation clearing and ground-disturbing activities shall be conducted outside of the bird nesting season (generally February 15 through August 31), if feasible.	Prior to vegetation clearing and ground-disturbing activities Nesting bird survey within three (3) days prior to any disturbance of the site.	Verify Pre-Construction Surveys Conducted. Field Inspection signoff, and	Qualified Biologist City of Rialto Community Development Department, Planning Division

Standard Conditions; Mitigation Measures; Laws, Ordinances and Regulations	**Implementation Timing**	**Monitoring/Reporting Method**	**Responsible Party for Implementation/ Approval**	**Verification**	
				Date	**Initials**
Regardless of the time of year, a qualified biologist shall conduct a nesting bird survey within three (3) days prior to any disturbance of the site, including but not limited to vegetation clearing, disking, demolition activities, staging, or grading.		compliance report by Qualified Biologist			
MM BIO-5B: Nesting Bird Surveys. If active nests are identified, the biologist shall establish suitable buffers around the nests depending on the level of activity within the buffer and species observed. Buffer areas shall be avoided until the nests are no longer occupied, and the juvenile birds can survive independently from the nests. During construction activities, the qualified biologist shall continue biological monitoring activities at a frequency recommended by the qualified biologist using their best professional judgment. If nesting birds are documented, avoidance and minimization measures may be adjusted and construction activities stopped or redirected by the qualified biologist to avoid take of nesting birds. If nesting birds are not documented during the pre-construction survey, adherence to additional measures may not be necessary to avoid impacts to nesting birds.	Pre-construction nesting bird survey. Biological monitoring ongoing during construction.	Verify Pre-Construction Surveys Conducted. Field Inspection signoff, and compliance report by Qualified Biologist	Qualified Biologist City of Rialto Community Development Department, Planning Division		
MM BIO-6A: Special-Status Preconstruction Lizard Surveys. Within 30 days prior to the commencement of any on-site Project activities, a qualified biologist shall conduct pre-construction surveys in suitable special-status lizard habitat throughout the project site. Project-related activities that would result in ground disturbance include any construction, vegetation removal, equipment and vehicle access, parking, and staging. The qualified biologist shall have familiarity with special-status lizard species as recognized by CDFW. A minimum of one daytime survey during suitable weather for lizard activity shall be conducted by walking linear transects spaced to provide 100 percent coverage of suitable habitat. The location of any observed special-status lizards shall be documented. If feasible, the locations of any special-status lizards shall be avoided. Avoidance measures shall be monitored by the qualified biologist.	Preconstruction surveys within 30 days prior to the commencement of any on-site Project activities.	Verify Pre-Construction Surveys Conducted. Field Inspection signoff, and compliance report by Qualified Biologist	Qualified Biologist City of Rialto Community Development Department, Planning Division		
MM BIO-6B: Special-Status Preconstruction Lizard Surveys. If pre-construction surveys are positive for coastal whiptail, coast horned lizard, or Southern California legless lizard and avoidance is not feasible, CDFW shall be notified in writing. In addition, relocation of all observed special-status lizard individuals shall be attempted and, if feasible, lizards would be relocated to the nearest available suitable habitat on conserved land in consultation with CDFW.	During pre-construction surveys.	Verify Pre-Construction Surveys Conducted. Cultural Resources					
MM CUL-1 Retention of Archaeologist. Prior to issuance of any permit for ground-disturbing activities, the Project Applicant shall provide evidence to the City of Rialto (City) that a qualified professional archaeologist meeting Secretary of the Interior professional qualifications (Project Archaeologist) has been retained.	Prior to issuance of any permit for ground-disturbing activities.	Verify Pre-Construction Surveys Conducted. Field Inspection signoff, and compliance report by Qualified Archaeologist.	Project Archeologist City of Rialto Community Development Department, Planning Division		
MM CUL-2: Cultural Resource Management Plan. Prior to any ground-disturbing activities the Project Archaeologist shall develop a Cultural Resource Management Plan (CRMP) to address the details, timing, and responsibilities of all archaeological and cultural resource activities that occur on the project site. The CRMP shall be written in consultation with the Consulting Tribes and shall include the following: approved Mitigation Measures (MM)/Conditions of Approval (COA), contact information for all pertinent parties, parties' responsibilities, procedures for each MM or COA, and an overview of the Project schedule.	Prior to issuance of any permit for ground-disturbing activities.	Approval of Cultural Resources Management Plan	Project Archeologist City of Rialto Community Development Department, Planning Division Consulting Tribes		
MM CUL-3: Cultural Resources Sensitivity Training. A Cultural Resources Training shall be provided to all construction managers and construction personnel prior to commencing any ground disturbance work within the project area. The training shall be prepared and conducted or overseen by the Project Archaeologist. The training content shall include, but is not limited to, information about any known cultural resources in Project area and vicinity and the process for inadvertent discovery. The training may be discontinued when ground disturbance is completed. Construction personnel shall not be permitted to operate equipment within the construction area unless they have attended the training. The Qualified Archeologist or designated Archaeological Monitor and Monitoring Tribes' designated representatives shall attend the pre-grade meeting with the grading contractors to conduct the initial training and explain and coordinate the requirements of the Cultural Resource Management Plan.	Prior to commencing any ground disturbance work.	Verify Pre-Construction Surveys Conducted. Field Inspection signoff, and compliance report by Qualified Archaeologist	Construction Managers and Construction Personnel, Project Archaeologist or designated Archaeological Monitor City of Rialto Community Development Department, Planning Division Monitoring Tribes		
MM CUL-4: Archaeological Monitoring. The Project Archaeologist shall monitor or supervise archaeological monitors (Monitors) for initial ground disturbing activities. After initial grading, should no cultural resources be present and/or subsurface soils indicate a low likelihood for significant intact resources, the Project Archaeologist shall	Archeological monitoring during initial ground disturbing activities.	Verify Pre-Construction Surveys Conducted. Field Inspection signoff, and	Project Archaeologist City of Rialto Community Development Department, Planning Division

have the ability to recommend archaeological monitoring be decreased or eliminated after initial ground-disturbing activities are complete, which shall be approved in writing by the City. Any such recommendation shall be specific to archaeological monitoring and not impact the implementation of Mitigation Measures TCR-1 and/or TCR-2.		compliance report by Qualified Archaeologist			
MM CUL-5: Inadvertent Discovery of Cultural Resources. In the event that cultural resources are discovered during Project implementation, all earthwork and ground-disturbing activities shall halt within a buffer of the discovery established by the Project Archaeologist and the Project Archaeologist shall assess the nature and significance of the find. The Project Archaeologist shall coordinate with the City and identify whether the resource is potentially significant and if it requires further evaluation. Work on the other portions of the project site outside of the buffered area may continue during this assessment period. If the cultural resources are Native American in origin, the Consulting Tribes must be immediately contacted and consulted regarding potential significance and treatment of the resource. Specifically, the Consulting Tribes shall be contacted, as detailed within Tribal Cultural Resources (TCR) Mitigation Measure 3, regarding any pre-contact finds and shall be provided information after the Project Archaeologist makes his/her initial assessment of the nature of the find, so as to provide Tribal input with regard to significance and treatment. For any potential significant cultural resources, the Project Archaeologist shall make recommendations to the City to avoid or mitigate impacts to the resource. If significant pre-contact cultural resources, as defined by CEQA, are discovered and avoidance cannot be ensured, the archaeologist shall develop a Monitoring and Treatment Plan, the drafts of which shall be provided to the Consulting Tribes for review and comment, as detailed within TCR-1. The Project Archaeologist shall monitor the remainder of the Project and implement the Monitoring and Treatment Plan accordingly. Preservation in place (i.e. avoidance) is the preferred manner of treatment. If preservation in place is not feasible, treatment may include implementation of archaeological data recovery to excavate the resource along with subsequent laboratory processing and analysis. Disposition of significant Native American archaeological materials, such as reburial or curation by a qualified repository within San Bernardino County, shall be agreed upon	During Project implementation	Verify Pre-Construction Surveys Conducted. by the City and Consulting Tribes. Any significant non-Native American archaeological material shall be curated at a public, non-profit institution with a research interest in the materials within San Bernardino County, if such an institution agrees to accept the material. If no institution accepts the archaeological material, it shall be offered to a local school or historical society in the area for educational purposes. All identified cultural resources shall be recorded on appropriate California Department of Parks and Recreation (CA DPR 523) series forms and evaluated for significance. All findings shall be included within a Monitoring Report drafted by the Project Archaeologist and submitted to the City and Consulting Tribes for review. Final copies of the Monitoring Report shall be submitted to the City, Consulting Tribes, and South Central Coastal Information Center (SCCIC).					
SC CUL-1. If human remains are encountered during the undertaking, California State Health and Safety Code Section 7050.5 states that excavation shall stop and no further disturbance shall occur within 100 feet of the discovery until the County Coroner has made a determination of origin and disposition of the remains pursuant to Public Resources Code Section 5097.98. The County Coroner must be notified of the find immediately. If the remains are determined to be prehistoric, the Coroner will notify the Native American Heritage Commission (NAHC), which will determine and notify a Most Likely Descendant (MLD). With the permission of the landowner or his/her authorized representative, the MLD may inspect the site of the discovery within 48 hours of notification. If the NAHC is unable to identify an MLD, the MLD fails to make a recommendation, or the landowner or his/her authorized representative rejects the recommendation, the human remains and associated items will be interred on the property with appropriate dignity in a location that will not be subject to future disturbance. a) Include an analysis of the expected ground motions at the site from known active faults using accepted methodologies; b) Determine structural design requirements as prescribed by the most current version of the California Building Code, including applicable City amendments, to ensure that structures can withstand ground accelerations expected from known active faults; and c) Determine the final design parameters for walls, foundations, foundation slabs, utilities, roadways, parking lots, sidewalks, and other surrounding related improvements. Project plans for foundation design, earthwork, and site preparation shall incorporate all of the mitigation in the site-specific investigations. The structural engineer shall review the site-specific investigations, provide any additional necessary measures to meet Building Code requirements, and incorporate all applicable recommendations from the investigation in the structural design plans and shall ensure that all structural plans for the Project meet current Building Code requirements. The City's registered geotechnical engineer or third-party registered engineer retained to review the geotechnical reports shall review each site-specific geotechnical investigation, approve the final report, and require compliance with all geotechnical requirements contained in the investigation in the plans submitted for the grading, foundation, structural, infrastructure and all other relevant construction permits. The City shall review all Project plans for grading, foundations, structural, infrastructure and all other relevant construction permits to ensure compliance with the applicable geotechnical investigation and other applicable Code requirements.			City of Rialto Public Works Department City of Rialto's registered geotechnical engineer or third-party registered engineer		
MM GEO-1: Paleontological Monitoring. Prior to the issuance of any grading permits, or any permit authorizing ground disturbance, the Project Applicant shall, to the satisfaction of the City of Rialto Community Development Director, demonstrate that a qualified paleontologist has been retained to respond on an as-needed basis to address unanticipated paleontological discoveries. A paleontologist is defined as an individual with an M.S./M.A. or Ph.D. in paleontology or geology who is familiar with paleontological procedures and techniques, and who is knowledgeable in the geology and paleontology of the area.	Prior to the issuance of any grading permits for ground-disturbing activities.	Verify Pre-Construction Surveys Conducted. Field Inspection signoff, and compliance report by Qualified Paleontologist	Project Applicant City of Rialto Community Development Director Qualified Paleontologist		

Locust Gateway Development Project Mitigation Monitoring and Reporting Program					
Standard Conditions; Mitigation Measures; Laws, Ordinances and Regulations	**Implementation Timing**	**Monitoring/Reporting Method**	**Responsible Party for Implementation/ Approval**	**Verification**	
				Date	**Initials**
In the event that fossils or fossil-bearing deposits are inadvertently unearthed during excavation and grading activities, all earth disturbing activities within a 100-foot radius of the area of discovery shall be temporarily halted or diverted. The qualified paleontologist shall be contacted to evaluate the significance of the finding and determine an appropriate course of action in accordance with Society of Vertebrate Paleontology standards and assess the significance of the find under the criteria set forth in CEQA Guidelines Section 15064.5. The paleontologist shall notify the appropriate agencies to determine procedures that would be followed before construction is allowed to resume at the location of the find. If in consultation with the paleontologist, City staff and the Project Applicant determine that avoidance is not feasible, the paleontologist shall prepare an excavation plan for reducing the effect of the Project on the qualities that make the resource important. The plan shall be submitted to the City for review and approval and the Project Applicant shall implement the approval plan.					
Greenhouse Gas Emissions					
LOR GHG-1. Limit idling time for commercial vehicles to no more than five minutes per Title 13 of the California Code of Regulations, Section 2485.	Ongoing during construction	On-site inspections	City of Rialto Public Works Department, Engineering Services		
LOR GHG-2. In accordance with California Title 24 Standards, buildings will be designed to have 15 percent of the roof area "solar ready" that will structurally accommodate later installation of rooftop solar panels. If future building operators pursue providing rooftop solar panels, they will submit plans for solar panels prior to occupancy.	Condition of issuance of Building Permit	On-site inspections	City of Rialto Community Development Department, Building and Safety Division		
LOR GHG-3. Install water-efficient irrigation systems and devices, such as soil moisture-based irrigation controls and sensors for landscaping, according to the City's Water Efficient Landscape requirements (Chapter 12.50 of the City's Municipal Code).	Prior to Issuance of Occupancy Permit	Documentation of Low Water Use Landscaping	City of Rialto Community Development Department, Planning Division		
LOR GHG-4. Design buildings to be water efficient. Install water-efficient fixtures in accordance with Section 5.303 of the California Green Building Standards Code Part 11.	Condition of issuance of Building Permit Prior to issuance of Occupancy Permit	On-site inspections	City of Rialto Community Development Department, Building and Safety Division		

Locust Gateway Development Project Mitigation Monitoring and Reporting Program					
Standard Conditions; Mitigation Measures; Laws, Ordinances and Regulations	**Implementation Timing**	**Monitoring/Reporting Method**	**Responsible Party for Implementation/ Approval**	**Verification**	
				Date	**Initials**
LOR GHG-5. Recycle and/or salvage for reuse a minimum of 65 percent of the nonhazardous construction and demolition waste in accordance with Section 5.408.1 of the California Green Building Standards Code Part 11.	Ongoing during demolition and construction	On-site inspections	City of Rialto Community Development Department, Building and Safety Division		
LOR GHG-6. Provide storage areas for recyclables and green waste and adequate recycling containers located in readily accessible areas in accordance with Section 5.410 of the California Green Building Standards Code Part 11.	Condition of issuance of Building Permit Prior to issuance of Occupancy Permit	On-site inspections	City of Rialto Community Development Department, Building and Safety Division		
LOR GHG-7. To facilitate future installation of electric vehicle supply equipment (EVSE), construction shall comply with Section 5.106.5.3 (nonresidential electric vehicle charging) of the California Green Building Standards Code Part 11.	Condition of issuance of Building Permit Prior to issuance of Occupancy Permit	On-site inspections	City of Rialto Community Development Department, Building and Safety Division		
MM GHG-1: On-Site Renewable Electricity Generation. Prior to the issuance of the final Certificate of Occupancy for the building tenant, documentation shall be provided to the City demonstrating that the Project has either: 1) installed solar photovoltaic (PV) panels or other source of renewable energy generation on the site, or 2) otherwise acquired energy from the local utility that has been generated by renewable sources, such that either option will provide 100 percent of the expected building load which is anticipated to be approximately 1.42 kilowatt hours per year [kWh/year] per square foot). Alternatively, the Project may achieve 100 percent of the building's expected energy load through a combination of on-site renewable energy generation and renewable energy purchase. The final PV generation facility size requires approval by Southern California Edison (SCE). Should SCE limit the facility size, the amounts above shall be limited to the amount of SCE's approval. This mitigation measure applies only to tenant improvements and not the building shell approvals.	Prior to the issuance of the final Certificate of Occupancy for the building tenant.		Project Applicant City of Rialto Community Development Department, Building and Safety Division Southern California Edison (SCE)		
MM GHG-2: CALGreen Tier 2. Prior to the issuance of a building permit, the Project Applicant or successor in interest shall provide documentation to the City of Rialto Community Development Department, Building and Safety Division demonstrating that the Project is designed to meet or exceed 2022 CALGreen Tier 2 standards in effect at the time of building permit application.	Prior to the issuance of a building permit.	Field inspection signoff	Project Applicant City of Rialto Community Development Department, Building and Safety Division		
MM GHG-3: Solid Waste Diversion. Prior to issuance of tenant occupancy permits, the Project operator shall designate a solid waste management coordinator and	Prior to issuance of tenant occupancy permits	Field inspection signoff	Project Applicant

implement a waste management plan to recycle and/or salvage nonhazardous debris to achieve a minimum 75 percent diversion from landfills. The City of Rialto Community Development Department, Planning Division shall confirm that sales or lease agreements includes contractual language that obligates tenants, operators, or future owners to comply with the solid waste management plan. This mitigation measure applies only to tenant permits and not the building shell approvals.			City of Rialto Community Development Department, Planning Division		
MM GHG-4: Water Use Efficiency and Conservation Plan. The Project Applicant or designee shall implement a Water Use Efficiency and Conservation Plan that includes the following minimum requirements: **Indoor Conservation Features and Operations:** ▪ Install low-flow Fixtures: Install low-flow toilets at 1.28 gallons per flush, faucets at 1.2 gallons per minute, showerheads at 1.8 gallons per minute, kitchen faucets at 1.8 gallons per minute. In common areas, install faucets at 0.5 gallon per minute and urinals at max of 0.25 gallon per minute/flush. (These fixtures use less water while maintaining efficient performance.) ▪ Install dual-flush toilets: These toilets offer two flush options: one for liquid waste less than 1 gallons per minute and another for solid waste at 1.28 gallons per minute. (This allows the appropriate use of water for flushing needs.) ▪ Use water-efficient appliances: The Project Applicant or designee shall install energy-efficient and water-saving appliances with the ENERGY STAR label only. ▪ Good housekeeping and regular maintenance: The Project Applicant or designee shall regularly check and maintain plumbing fixtures, irrigation systems, and appliances to ensure they are functioning efficiently and not wasting water. **Outdoor Conservation Features and Operations:** ▪ Install only "Smart Irrigation Systems" for community landscaping: The Project Applicant or designee shall use smart sprinkler systems that adjust watering schedules based on weather conditions, soil moisture, and plant needs to avoid over or wasteful watering. The Project Applicant or designee shall also incorporate seasonal specific controls to ensure watering occurs during the most efficient times of day.	Condition of issuance of Building Permit Confirmation prior to Certificate of Occupancy	On-site inspection	Project Applicant City of Rialto Community Development Department, Building and Safety Division

				Date	**Initials**
▪ Adjustable Water Pressure Regulator: The Project Applicant or designee shall install pressure regulators to maintain optimal water pressure, preventing overuse and leaks. ▪ Drought-tolerant landscaping: The Project Applicant or designee shall include native and drought-tolerant vegetation that requires less water to thrive and is known to survive in the City of Rialto. The Project Applicant or designee shall replace drought-tolerant landscaping if it dies through enforceable Project CC&Rs and/or tenant lease agreements.					
Hazards and Hazardous Materials					
MM HAZ-1: Asbestos Survey and Lead-Based Paint Survey. Prior to approval of a demolition permit by the City of Rialto, an asbestos survey and a lead-based paint survey shall be conducted pursuant to applicable local, State, and federal laws. All asbestos-containing building materials shall be removed prior to structure demolition. Abatement or paint stabilization techniques shall be applied prior to demolition. Such measures shall include removal and stabilization of loose, flaking or peeling paint. Measures shall be taken to ensure that paint chips are not generated in the demolition process. All work shall be performed by an abatement contractor who is certified by the California OSHA Division of Occupational Safety and Health (Cal/OSHA) with properly trained and registered workers. All abatement techniques shall be in accordance with Cal/OSHA and U.S. Environmental Protection Agency (U.S. EPA) protocol and also in conformance with South Coast Air Quality Management District (SCAQMD) rules. All removed asbestos-containing building materials and lead-based paint shall be properly disposed of at a landfill certified to accept said materials, and waste shall be transported under the waste manifest by a certified waste transportation company. Once all of these materials have been removed, structure demolition may commence.	Prior to approval of a demolition permit.	Field inspection signoff	City of Rialto Community Development Department, Building and Safety Division Abatement Contractor		
MM HAZ-2: Munitions Monitor. Prior to issuance of grading permits, the Applicant shall submit proof to the City of Rialto Director of Community Development of the retainment of a munitions expert. A munitions expert must be an individual that is qualified to perform appropriate tasks per Department of Defense Explosives Safety	Prior to the issuance of the first grading permit Daily monitoring during grading activities	Field inspection signoff	Project Applicant City of Rialto Director of Community Development		

Locust Gateway Development Project Mitigation Monitoring and Reporting Program

				Date	**Initials**
Board Technical Paper-18 (DESB TP-18) standards. The munitions expert shall be onsite to monitor grading activities for unexploded ordinances (UXOs) and discarded military munitions (DMMs) and provide daily safety briefings before the start of construction. If UXOs are encountered during this process, the munitions expert shall have the authority to halt all or a portion of construction activities and contact the City of Rialto Police department at (909) 820-2550 to report and determine proper UXO handling and disposal. The munitions expert shall have the authority to halt all or a portion of construction activities at their discretion until such time that an encountered UXO is deemed properly disposed of.			Munitions Expert		
MM HAZ-3: Soil Management Plan. Prior to the issuance of a grading permit, the Applicant shall submit a Soil Management Plan (or equivalent document) to be implemented for construction of the Proposed Project. The objective of the Soil Management Plan is to provide guidance for the proper handling, onsite management, and disposal of impacted soil that might be encountered during construction activities. The plan would include practices that are consistent with the California Title 8, Occupational Safety and Health Administration (Cal-OSHA) regulations, as well as appropriate remediation standards that are protective of the planned use. Appropriately trained professionals would be on site during preparation, grading, and related earthwork activities to monitor soil conditions encountered. The Soil Management Plan would provide guidelines for the following: ▪ Identifying impacted soil ▪ Assessing impacted soil ▪ Soil excavation ▪ Impacted soil storage ▪ Verification sampling ▪ Impacted soil characterization and disposal The plan shall outline how Project construction crews would identify, handle, and dispose of potentially contaminated soil; identify the qualifications of the appropriately trained professionals that would monitor soil conditions and conduct soil sampling during construction; coordinate laboratory testing; and oversee disposal. The Soil Management Plan shall also include requirements for documenting and reporting incidents of encountered contaminants, such as documenting locations of occurrence,	Prior to the issuance of a grading permit. Soil Management Plan shall be submitted to the city and CUPA 45 days prior to the start of construction for review and approval.	Field inspection signoff	Project Applicant City of Rialto Community Development Department, Building and Safety Division CUPA

				Date	**Initials**
sampling results, and reporting actions taken to dispose of contaminated materials. In the event that potentially contaminated soils were encountered within the footprint of construction, soils would be tested and stockpiled. The appropriate Certified Unified Program Agency (CUPA) would determine whether further assessment is warranted. The Soil Management Plan shall be submitted to the city and CUPA 45 days prior to the start of construction for review and approval.					
MM-HAZ 4: Contaminated Soil Treatment. If previously unidentified soil contamination is observed by sight or odor or indicated by testing by a qualified professional using a portable volatile organic compound analyzer during excavation and grading activities, excavation and grading within such an area shall be temporarily halted and redirected around the area until the appropriate evaluation and follow-up measures are implemented, as contained in the South Coast Air Quality Management District's Rule 1166, to make the area suitable for grading activities to resume. In the event contamination is found, the Applicant shall notify the San Bernardino County Fire Department and the South Coast Air Quality Management District, as applicable. The contaminated soil shall be evaluated and excavated/disposed of, treated in-situ (in-place), or otherwise managed and disposed of in accordance with all applicable federal, State, and local laws and regulations.	During excavation and grading activities.	Field inspection signoff	Project Applicant San Bernardino County Fire Department South Coast Air Quality Management District City of Rialto Community Development Department, Building and Safety Division		
Hydrology and Water Quality					
SC HYD-1. The Applicant or his/her designees shall obtain a General Permit for Stormwater Discharge Associated with Construction Activity (Construction Activity General Permit). The Applicant or his/her designees shall provide a copy of this permit to the City Public Works Department prior to the issuance of the first grading permit.	Prior to the issuance of the first grading permit	Verify permit	Project Applicant City of Rialto Public Works Department		
SC HYD-2. Prior to issuance of the first grading permit, the Applicant shall submit to the City Engineer for approval, a Storm Water Quality Management Plan (SWQMP) specifically identifying Best Management Practices (BMPs) that will be incorporated into the Project to control stormwater and non-stormwater pollutants during and after construction. To ensure compliance, a legal and fiduciary enforcement mechanism in the form of a Storm Water Quality Management Plan Agreement shall be executed with the City of Rialto. This agreement shall additionally be recorded in the office of the County Recorder for the County of San Bernardino. The SWQMP shall	Prior to the issuance of the first grading permit	Verify plans	Project Applicant City of Rialto Engineer County Recorder for the County of San Bernardino

specify BMPs specific to the project site, which shall be integrated into the stormwater conveyance plan. The plan shall identify specific strategies, including the following. ▪ Site design features, including maximizing open space, preservation of natural drainages, and minimization of impervious surfaces. ▪ Source control features, including leveraging public outreach and education, use of appropriate landscaping, and covering trash storage areas. ▪ Treatment controls, including the use of underground chambers.					
SC HYD-3. An Erosion Control Plan shall be prepared, and included with the Project's grading plan, and implemented for the Project that identifies specific measures to control on-site and off-site erosion from the time ground disturbing activities are initiated through completion of grading. The Erosion Control Plan shall include the following measures at a minimum: ▪ Specify the timing of grading and construction to minimize soil exposure to rainy periods experienced in Southern California; and ▪ An inspection and maintenance program shall be included to ensure that any erosion which does occur either on-site or off-site as a result of this Project will be corrected through a remediation or restoration program within a specified timeframe.	Prior to issuance of the first grading permit.	Verify plans	City of Rialto Community Development Department, Building and Safety Division		
Noise					
MM NOI-1: Noise Shielding and Muffling. Power construction equipment (including combustion engines), fixed or mobile, shall be equipped with noise shielding and muffling devices consistent with manufacturers' standards or the Best Available Control Technology, which achieve a noise reduction of 10 dBA or greater. All equipment shall be properly maintained, and the Applicant or Owner shall require any construction contractor to keep documentation on-site during any earthwork or construction activities demonstrating that the equipment has been maintained in accordance with manufacturer's specifications.	Ongoing during any earthwork or construction activities	Verify incorporation of applicable noise measures. Field inspection sign-offs. Submittal of compliance report from qualified noise consultant.	Project Applicant or Owner City of Rialto Community Development Department, Building and Safety Division		
SC PS-1. Prior to the issuance of the first grading permit and/or action that would permit site disturbance, the Applicant shall provide evidence to the City of Rialto Police Department that a construction security service or equivalent service shall be established at the construction site along with other measures, as identified by the	Prior to the issuance of the first grading permit and/or action that would permit site disturbance. Police Department and the Public Works Department, to be instituted during the grading and construction phase of the Project.			City of Rialto Public Works Department		
SC PS-2. Prior to issuance of building permits, the City of Rialto Police Department shall review development plans for the incorporation of defensible space concepts to reduce demands on police services. Public safety planning recommendations shall be incorporated into the Project plans. The Applicant shall prepare a list of Project features and design components that demonstrate responsiveness to defensible space design concepts. The Police Department shall review and approve all defensible space design features incorporated into the Project prior to initiating the building plan check process.	Prior to issuance of building permits	Verify Required Public Safety Information on Development Plans	Project Applicant City of Rialto Police Department		
Transportation					
SC TRAN-1. Prior to issuance of any grading or building permit, the Applicant shall submit for City of Rialto Community Development Director and Traffic Engineer review and approval a Construction Management Plan for the Project. The Plan shall identify construction phasing and address traffic control for any temporary street closures, detours, or other disruptions to traffic circulation and public transit routes. The Plan shall identify the routes that construction vehicles shall use to access the site, the hours of construction traffic, traffic controls and detours, construction materials and vehicle staging areas, and temporary parking arrangements for the construction workers.	Prior to issuance of any Grading or Building Permit	Approved Construction Management Plan	Project Applicant City of Rialto Community Development Director City of Rialto's Traffic Engineer		
Tribal Cultural Resources					
MM TCR-1: Native American Monitoring for Gabrieleño Band of Mission Indians – Kizh Nation. The Project Applicant shall retain a Native American Monitor from or approved by the Gabrieleño Band of Mission Indians – Kizh Nation. The monitor shall be retained prior to the commencement of the first permit that would result in a "ground-disturbing activity" for the subject project at all project locations (i.e., both on-site and any off-site locations that are included in the Project description/definition and/or required in connection with the Project, such as public improvement work). "Ground-disturbing activity" shall include, but is not limited to, demolition, pavement	Monitor shall be retained prior to the commencement of any ground-disturbing activity. Monitor shall complete daily monitoring logs.	Submittal of executed monitoring agreement to the City of Rialto	Project Applicant City of Rialto Community Development Department, Planning Division Gabrieleño Band of Mission Indians – Kizh Nation, Morongo Band of Mission Indians

removal, potholing, auguring, grubbing, tree removal, boring, grading, excavation, drilling, and trenching. A copy of the executed monitoring agreement shall be submitted to the City of Rialto prior to the commencement of any ground-disturbing activity, or the issuance of any permit necessary to commence a ground-disturbing activity. The agreement would also address the consideration of rotating monitoring with the Morongo Band of Mission Indians. The monitor shall complete monitoring logs that provide descriptions of the relevant ground-disturbing activities, the type of construction activities performed, locations of ground-disturbing activities, soil types, cultural-related materials, and any other facts, conditions, materials, or discoveries of significance to the Tribe. Monitor logs shall identify and describe any discovered Tribal Cultural Resources, including but not limited to, Native American cultural and historical artifacts, remains, places of significance, etc., (collectively, tribal cultural resources, or "TCR"), as well as any discovered Native American (ancestral) human remains and burial goods. Copies of monitor logs shall be provided to the Project Applicant/City of Rialto upon written request to the Tribe. On-site tribal monitoring shall conclude upon one of the following (1) written confirmation to the Kizh from a designated point of contact for the Project Applicant or City of Rialto that all ground-disturbing activities and phases that may involve ground-disturbing activities on the project site or in connection with the Project are complete; or (2) a determination and written notification by the Kizh to the Project Applicant or City of Rialto that no future, planned construction activity and/or development/construction phase at the project site possesses the potential to impact Kizh TCRs.					
MM TCR-2: Native American Monitoring for Morongo Band of Mission Indians. Prior to the issuance of the first permit that would result in a "ground-disturbing activity," the Applicant shall enter into a Tribal Monitoring Services Agreement with the Morongo Band of Mission Indians for the Project. The agreement would also address the consideration of rotating monitoring with the Gabrieleño Band of Mission Indians – Kizh Nation. The Tribal Monitor shall be on-site during all (or as deemed necessary)	Prior to the issuance of the first permit that would result in a ground-disturbing activity	Field Inspection signoff by Qualified Monitor	Project Applicant City of Rialto Community Development Department, Planning Division

ground-disturbing activities (including, but not limited to, clearing, grubbing, tree and bush removal, grading, trenching, fence post placement and removal, construction excavation, excavation for all utility and irrigation lines, and landscaping phases of any kind). The Tribal Monitor shall have the authority to temporarily divert, redirect, or halt the ground-disturbing activities to allow identification, evaluation, and potential recovery of cultural resources. The Tribal Monitor can establish a buffer around the discovery.			Gabrieleño Band of Mission Indians – Kizh Nation, Morongo Band of Mission Indians		
MM TCR-3: Inadvertent Discovery of a Tribal Cultural Resource. The Consulting Tribes shall be contacted and informed of any pre-contact cultural resources discovered during Project implementation and be provided information regarding the nature of the find, so as to provide Tribal input with regards to significance and treatment (pursuant to Mitigation Measure [MM] CUL-5). Should the find be deemed significant, as defined by CEQA, the find shall be addressed to the protocols outlined in the Cultural Resources Management Plan from MM CUL-2. Any and all archaeological/cultural documents created as a part of the Project (isolate records, site records, survey reports, testing reports, etc.) shall be supplied to the Project Applicant and the City of Rialto for dissemination to the Consulting Tribes.	Ongoing during grading	Field Inspection signoff by Qualified Monitor Consultation with Tribes, as necessary	Consulting Tribes Qualified Archaeologist City of Rialto Community Development Department, Planning Division		

RESOLUTION NO. 2025-XX

A RESOLUTION OF THE PLANNING COMMISSION OF THE CITY OF RIALTO, CALIFORNIA RECOMMENDING THAT THE CITY COUNCIL CERTIFY THE FINAL ENVIRONMENTAL IMPACT REPORT SCH. 2024061274, AS RELATED TO A PROPOSED PROJECT CONSISTING OF THE DEVELOPMENT OF A 664,859 SQUARE FOOT INDUSTRIAL WAREHOUSE BUILDING WITH ASSOCIATED PAVING, LANDSCAPING, FENCING, LIGHTING, AND DRAINAGE IMPROVEMENTS ON APPROXIMATELY 38.89 GROSS ACRES (38.78 NET ACRES) OF LAND (APN: 0239-192-23) LOCATED AT THE SOUTHWEST CORNER OF LOCUST AVENUE AND LOWELL STREET WITHIN THE GENERAL MANUFACTURING (I-GM) LAND USE DISTRICT OF THE RIALTO AIRPORT SPECIFIC PLAN; ADOPT FINDINGS OF FACT RELATED THERETO, AS REQUIRED BY PUBLIC RESOURCES CODE SECTION 21081(a) AND CEQA GUIDELINES, SECTION 15091; APPROVE A MITIGATION MONITORING AND REPORTING PROGRAM RELATED THERETO, AS REQUIRED BY PUBLIC RESOURCES CODE SECTION 21081.6 AND CEQA GUIDELINES SECTION 15097; AND ADOPT THE STATEMENT OF OVERRIDING CONSIDERATIONS RELATED THERETO, AS REQUIRED BY PUBLIC RESOURCES CODE SECTION 21081(b) AND CEQA GUIDELINES SECTION 15093.

WHEREAS, the applicant, IV5 Locust Gateway Logistics Center LLC, ("Applicant") proposes to develop and operate a 664,859 square foot industrial warehouse building with associated paving, landscaping, fencing, lighting, and drainage improvements ("Project") on approximately 38.89 gross acres (38.78 net acres) of land (APN: 0239-192-23) located at the southwest corner of Locust Avenue and Lowell Street within the General Manufacturing (I-GM) land use district of the Rialto Airport Specific Plan ("Site"); and

WHEREAS, the City of Rialto ("City") has undertaken review under the California Environmental Quality Act ("CEQA"), Public Resources Code Sections 21000, *et seq*. and California Code of Regulations ("CEQA Guidelines") Title 14, Sections 15000, *et seq*.; and

WHEREAS, the Applicant retained Kimley-Horn and Associates, Inc., an environmental consulting firm, to prepare an environmental impact report ("EIR") for the Project; and

WHEREAS, the City retained EcoTierra Consultants, an environmental consulting firm, to conduct a peer review of the EIR prepared for the Project by Kimley-Horn and Associates, Inc.; and

WHEREAS, on June 27, 2024, the City distributed a Notice of Preparation for Draft Environmental Impact Report SCH. 2024061274, for the Project, pursuant to CEQA Guidelines Section 15082 and Public Resources Code Section 21080.4, providing a 30-day period during which responsible agencies, trustee agencies, and members of the general public could provide comments to the City regarding the scope of the proposed EIR; and

WHEREAS, pursuant to the authority and criteria contained in CEQA and the City of Rialto environmental guidelines, the City, as the Lead Agency, analyzed the Project and directed the Applicant to prepare a Draft Environmental Impact Report ("DEIR"), and determined that the proposed Project would have significant impacts related to greenhouse gas emissions from Project operations; and

WHEREAS, consistent with the requirements of CEQA Guidelines Section 15085, upon completing the DEIR dated September 2025, the City filed a Notice of Completion on September 8, 2025 with the Office of Planning and Research; and

WHEREAS, on September 5, 2025 consistent with the requirements of the Public Resources Code Section 21092 and CEQA Guidelines Section 15087, the City published a Notice of Availability of the DEIR in the San Bernardino Sun newspaper, and, on September 5, 2025, posted the Notice of Availability at City Hall and mailed a Notice of Availability to all responsible and trustee agencies, all organizations and individuals who had requested notice, and all property owners located within a 1,000 foot radius of the Site; and

WHEREAS, the Notice of Availability and Notice of Completion noticed all agencies, organizations, and the public that they had 45 days to provide comments on the contents of the DEIR, which was available in hard copy for in-person review at City Hall – the Community Development Building - and available for download on the City of Rialto website, throughout the comment period; and

WHEREAS, at the conclusion of the 45-day public review and comment period related to the DEIR, the City directed the preparation of the Final Environmental Impact Report dated December 2025 ("FEIR") pursuant to CEQA Guidelines Sections 15088, 15089 and 15132, which included the DEIR, responses to public comments on the DEIR, and a Mitigation Monitoring and Reporting Program; and

WHEREAS, pursuant to CEQA Guidelines Section 15132, the FEIR is required to be completed in compliance with CEQA, and pursuant to Section 21092.5 of CEQA, on December 4, 2025, the City sent via email and mail the FEIR, including written responses to comments, to all agencies, organizations, and persons that commented on the DEIR; and

WHEREAS, on December 5, 2025, the City published a Notice of Public Hearing that the Planning Commission would consider recommending certification of the FEIR and approval of the Project to the City Council at its December 17, 2025 meeting in the San Bernardino Sun newspaper, posted the notice at City Hall, and mailed said notice to all property owners within a 1,000 foot radius of the Site as well as all to all organizations and individuals who had requested notice; and

WHEREAS, on December 17, 2025, the Planning Commission conducted a public hearing, and considered the record of proceedings for the FEIR, which includes, but is not limited to, the following:

(1) The Notice of Preparation for the Project (the "NOP"), and all other public notices issued by the City in connection with the Project;

(2) The FEIR dated December 2025;

(3) All written comments submitted by agencies or members of the public during any public review comment period on the DEIR;

(4) All written and verbal public testimony presented during a noticed public hearing for the Project at which such testimony was taken, including without limitation, the Staff Report to the Planning Commission, including all attachments, any all presentations by City staff, the City's consultants, the Applicant and the Applicant's consultants, the public, and any other interested party;

(5) The Mitigation Monitoring and Reporting Program for the Project (the "MMRP");

(6) The reports, studies and technical memoranda included and/or referenced in the DEIR and the FEIR and or their appendices;

(7) All documents, studies, or other materials incorporated by reference in the DEIR and the FEIR;

(8) All Ordinances and Resolutions presented to and/or to be adopted by the City in connection with the Project; and all documents incorporated by reference therein, specifically including, but not limited to, this Resolution and its exhibit;

(9) Matters of common knowledge to the City, including but not limited, to federal, state, and local laws and regulations, adopted City plans, policies (including but not limited to the Rialto General Plan and the Rialto Airport Specific Plan), and the professional qualifications of City staff members and consultants;

(10) Any documents expressly cited in this Resolution and its exhibit, the Staff Report to the Planning Commission, the FEIR which includes the DEIR; and

(11) Any other relevant materials required to be in the record of proceedings under Section 21167.6(e) of the Public Resources Code; and

WHEREAS, the City has not pre-committed to approving the Project or the FEIR, and will not commit to any approval related to the Project until the Planning Commission and City Council consider and certify the FEIR for the Project based upon all evidence presented; and

WHEREAS, on December 17, 2025, following the public hearing, the Planning Commission considered and discussed the adequacy of the proposed FEIR as an informational document and applied their own independent judgment and analysis to review said FEIR, and hereby desire to take action to recommend that the City Council certify the FEIR, as having been completed in compliance with CEQA, based on the findings found herein; and

WHEREAS, at its December 17, 2025, meeting, following the public hearing, the Planning Commission also considered and decided whether to recommend approval or rejection of the Project at this time; and

WHEREAS, CEQA requires in Public Resources Section 21081 the following:

"Section 21081. Findings necessary for approval of project. Pursuant to the policy stated in Sections 21002 and 21002.1, no public agency shall approve or carry out a project for which an environmental impact report has been certified which identifies one or more significant effects on the environment that would occur if the project is approved or carried out unless both of the following occur:

(a) The public agency makes one or more of the following findings with respect to each significant effect:

(1) Changes or alterations have been required in, or incorporated into, the Project which mitigate or avoid the significant effects on the environment.

(2) Those changes or alterations are within the responsibility and jurisdiction of another public agency and have been, or can and should be, adopted by that other agency.

(3) Specific economic, legal, social, technological, or other considerations, including considerations for the provision of employment opportunities for highly trained workers, make infeasible the mitigation measures or alternatives identified in the environmental impact report.

(b) With respect to significant effects which were subject to a finding under paragraph (3) of subdivision (a), the public agency finds that specific overriding economic, legal, social, technological, or other benefits of the Project outweigh the significant effects on the environment."

WHEREAS, all legal prerequisites to the adoption of this Resolution have occurred.

NOW, THEREFORE, BE IT RESOLVED AS FOLLOWS, that the Planning Commission of the City of Rialto hereby do find, determine, and declare based upon the evidence presented as follows:

SECTION 1: RECITALS. The Planning Commission hereby finds all of the above recitals to be true and correct and such recitals are incorporated herein by this reference.

SECTION 2: FINDINGS. The FEIR available at the Community Development Department office and provided concurrently with this Resolution, includes the DEIR SCH No.

2024061274 dated September 2025 and all related appendices, the Response to Comments, and all related appendices and attachments to the FEIR dated December 2025. The Planning Commission finds, based upon the forgoing substantial evidence in the record of proceedings, and the whole record before it, in the exercise of its independent judgment and analysis, that the FEIR is, procedurally and substantively, in compliance with the requirements of CEQA:

a. *Procedural Compliance*: The Final EIR was prepared in procedural compliance with the requirements of CEQA:

1. Notice of Preparation. As described in the Recitals hereto, a Notice of Preparation was prepared in accordance with Section 15082 of CEQA.
2. Public Review. As described in the Recitals hereto, the City held multiple public review periods pursuant to the CEQA Guidelines.
3. Notice of Completion. As described in the Recitals hereto, the City has complied with CEQA Guidelines Sections 15085, 15086, 15087, and 15105 by providing a Notice of Completion of the DEIR to the State Clearinghouse and a Notice of Availability to responsible and trustee agencies and other persons and agencies as required.
4. Written Comments. As described in the Recitals hereto, the City has evaluated and responded to all written comments received during the public review period and included both comments and responses as part of the FEIR pursuant to CEQA Guidelines Section 15088.

b. *Findings Regarding Significant Effects that Can be Mitigated to Less Than Significant.* The FEIR identifies potentially significant effects on the environment that could result if the Project were adopted without changes or alterations in the Project and imposition of mitigation measures and further finds that changes, alterations, and mitigation

measures have been incorporated into, or imposed as conditions of approval on, the Project. The Planning Commission adopts the statements and findings in Exhibit A (Section 5.2, titled "Potentially Significant Impacts Which Can Be Mitigated Below a Level of Significance with Mitigation Measures") to this Resolution, which is attached hereto and incorporated herein by this reference. These avoidable significant effects are identified in Exhibit A (Section 5.2) and include potentially significant impacts to air quality, biological resources, cultural resources, geology and soils, greenhouse gas emissions, hazards and hazardous materials, noise and vibration, and tribal cultural resources. However, mitigation measures can be implemented to reduce these impacts to a level that is less than significant; changes have been required in, or incorporated into, the Project through the imposition of mitigation measures as described in Exhibit A (Section 5.2). These mitigation measures identified in Exhibit A will be imposed pursuant to the MMRP found at Section 4.0 in the FEIR. These changes, alterations, and mitigation measures are fully enforceable because they have either resulted in an actual change to the Project as proposed or they have been imposed as conditions of approval on the Project.

c. *Findings Regarding Unavoidable Significant Impacts*. The Planning Commission adopts the statements and findings in Exhibit A (Section 5.3, titled "Significant and Unavoidable Impacts of the Project") to this Resolution, which is attached hereto and incorporated herein by this reference. The Project has significant effects that cannot be mitigated to a less than significant level through the imposition of mitigation measures. These significant effects are identified in Exhibit A (Section 5.3). Specific economic, legal, social, technological, or other considerations are found to make the Proposed Project acceptable notwithstanding that even with

the required mitigation measures, and consideration of project alternatives identified in the FEIR for the significant impacts identified in Exhibit A (Section 5.4) all impacts cannot be reduced to less then and significant levels, including those based upon the findings in Exhibit A (Section 5.3) to this resolution, and the findings in Exhibit A (Section 5.4) regarding the proposed alternatives. Therefore, those impacts are found to be significant and unavoidable.

d. *Findings Regarding Less than Significant Impacts*. In the course of the DEIR evaluation, certain environmental impacts of the Project were found not to be significant. Any and all potential significant impacts discussed in the FEIR that are not subject to paragraph 2(b) or 2(c), above, as either an avoidable significant impact, or as an unavoidable significant impact, are insignificant impacts to the environment. There exists no fair argument that the environmental conditions that were found not to be significant in the DEIR will pose a significant environmental impact, due to the inability of a Project of this scope to create such impacts or the absence of Project characteristics producing significant effects of this nature.

SECTION 3: FEIR REVIEWED AND CONSIDERED. The Planning Commission has reviewed and considered the information contained in the FEIR and, based upon the forgoing, substantial evidence in the record of proceedings, and the whole record before it, in the exercise of its independent judgment and analysis, finds that the FEIR has been completed in compliance with CEQA.

SECTION 4: ALTERNATIVES. The FEIR identified potential environmental impacts of separate project alternatives compared to impacts from the proposed Project. These alternatives were selected based upon their ability to avoid or substantially lessen the significant effects of the proposed Project, while still achieving the primary Project objectives. Most alternatives are hereby found infeasible due to lack of alternative site availability, failure to meet basic Project objectives,

or the fact that some alternatives would still have the same types of significant and unavoidable impacts as the Project. Based upon the forgoing, substantial evidence in the record of proceedings, and the whole record before it, in the exercise of its independent judgment and analysis, the Planning Commission hereby recommends that the City Council adopt the Statement of Findings on rejection of Project Alternatives in Exhibit A (Section 5.4, titled "Alternatives to the Proposed Project") to this Resolution, which is attached hereto and incorporated herein by this reference.

SECTION 5: STATEMENT OF OVERRIDING CONSIDERATIONS. Based upon the forgoing, substantial evidence in the record of proceedings, and the whole record before it, in the exercise of its independent judgment and analysis, the Planning Commission finds, pursuant to CEQA Section 21081(b) and CEQA Guidelines Section 15093, that the specific economic, legal, social, technological and other benefits of the Project outweigh the Project's unavoidable adverse environmental impacts, and therefore, the impacts are acceptable. Based upon the forgoing, substantial evidence in the record of proceedings, and the whole record before it, in the exercise of its independent judgment and analysis, the Planning Commission hereby recommends that the City Council adopt the Statement of Overriding Considerations in Exhibit A (Section 6.0, titled "Statement of Overriding Considerations") to this Resolution, which is attached hereto and incorporated herein by this reference. Based upon the forgoing, substantial evidence in the record of proceedings, and the whole record before it, in the exercise of its independent judgment and analysis, the Planning Commission finds that each of the Significant and Unavoidable Impacts identified in Exhibit A (Section 5.3) may be considered acceptable for the reasons cited.

SECTION 6: MITIGATION MONITORING. The City as lead agency adopts the MMRP for the changes made to the Project that it has adopted in order to mitigate or avoid significant effects on the environment. Pursuant to Public Resources Code Section 21081.6, the MMRP set forth as Section 4.0 to the FEIR to this Resolution, which is attached hereto as Exhibit B and incorporated herein by this reference, is hereby adopted to ensure that all mitigation measures adopted for the Project are fully implemented. Based upon the forgoing, substantial evidence in the record of proceedings, and the whole record before it, in the exercise of its independent judgment and analysis, the Planning Commission hereby recommends that the City Council adopt

the MMRP to ensure compliance with mitigation measures during Project implementation. As required by Public Resources Code Section 21081.6, the MMRP designates responsibility and anticipated timing for the implementation of the mitigation measures recommended in the FEIR. The MMRP will remain available for public review during the compliance period.

SECTION 7: RECOMMENDATION OF CERTIFICATION. Based on the above facts and findings, in the exerciser of its independent judgment and analysis, the Planning Commission hereby recommends that the City Council certify the FEIR for the Project as accurate and adequate. Based on the above facts and findings, in the exerciser of its independent judgment and analysis, the Planning Commission further recommends that the City Council certify that the FEIR was completed in compliance with CEQA and the CEQA Guidelines.

SECTION 8: The Chairman of the Planning Commission shall sign the passage and adoption of this resolution and thereupon the same shall take effect and be in force.

PASSED, APPROVED, AND ADOPTED this 17th day of December, 2025.

_____

MICHAEL E. STORY, CHAIR
CITY OF RIALTO PLANNING COMMISSION

STATE OF CALIFORNIA)
COUNTY OF SAN BERNARDINO) ss
CITY OF RIALTO)

I, Heidy Gonzalez, Administrative Assistant of the City of Rialto, do hereby certify that the foregoing Resolution No. ____ was duly passed and adopted at a regular meeting of the Planning Commission of the City of Rialto held on the ___th day of ____, 2025.

Upon motion of Planning Commissioner_____., seconded by Planning Commissioner ____, the foregoing Resolution No. ____was duly passed and adopted.

Vote on the motion:

AYES:

NOES:

ABSENT:

IN WITNESS WHEREOF, I have hereunto set my hand and the Official Seal of the City of Rialto this __th day of ___, 2025.

EXHIBIT A

FINDINGS OF FACT AND STATEMENT OF OVERRIDING CONSIDERATIONS PREPARED PURSUANT TO THE CALIFORNIA ENVIRONMENTAL QUALITY ACT FOR THE FINAL ENVIRONMENTAL IMPACT REPORT FOR THE LOCUST GATEWAY DEVELOPMENT PROJECT STATE CLEARINGHOUSE NO. 2024061274

[See Following Pages]

Findings of Fact and Statement of Overriding Considerations

Prepared Pursuant to the California Environmental Quality Act for the Final Environmental Impact Report for the

Locust Gateway Development Project

State Clearinghouse No. 2024061274

1.0 FINDINGS OF FACT

1.1 INTRODUCTION

The California Environmental Quality Act ("CEQA") requires that a Lead Agency issue two sets of findings prior to approving a project that will generate a significant impact on the environment. The Findings of Fact are the first set of findings where the Lead Agency identifies the significant environmental impacts as identified in the Environmental Impact Report ("EIR"); presents facts supporting the conclusions reached in the analysis; makes one or more written findings for each impact; and explains the reasoning behind the agency's findings.

The Statement of Overriding Considerations is the second set of findings. Where a project will cause unavoidable significant impacts, the Lead Agency may still approve a project where its benefits outweigh the adverse impacts. Further, as provided in the Statement of Overriding Considerations, the Lead Agency sets forth specific reasoning by which benefits are balanced against effects, and approves the project.

The EIR was prepared by the City of Rialto ("City") acting as lead agency pursuant to CEQA. Hereafter, the Notice of Preparation, Notice of Availability/Notice of Completion, Draft EIR ("DEIR"), Technical Studies, Final EIR containing Responses to Comments and textual revisions to the DEIR, and the Mitigation Monitoring and Reporting Program ("MMRP") will be referred to collectively herein as the "EIR". The following Findings of Fact have been prepared in accordance with the California Public Resources Code Section 21081 and CEQA Guidelines (14 California Code of Regulations Section 15091) (collectively, CEQA). Section 15091 of the CEQA Guidelines provides that:

> (a) No public agency shall approve or carry out a project for which an EIR has been certified which identifies one or more significant environmental effects of the project unless the public agency makes one or more written findings for each of those significant effects, accompanied by a brief explanation of the rationale for each finding. The possible findings are:
>
> > (1) Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effect as identified in the final EIR.

(2) Such changes or alterations are within the responsibility and jurisdiction of another public agency and not the agency making the finding. Such changes have been adopted by such other agency or can or should be adopted by such other agency.

(3) Specific economic, legal, social, technological, or other considerations, including provision of employment opportunities for highly trained workers, make infeasible the mitigation measures or project alternatives identified in the final EIR.

(b) The findings required by subdivision (a) shall be supported by substantial evidence in the record.

(c) The finding in subdivision (a)(2) shall not be made if the agency making the finding has concurrent jurisdiction with another agency to deal with identified feasible mitigation measures or alternatives. The finding in subsection (a)(3) shall describe the specific reasons for rejecting identified mitigation measures and project alternatives.

(d) When making the findings required in subdivision (a)(1), the agency shall also adopt a program for reporting on or monitoring the changes which it has either required in the project or made a condition of approval to avoid or substantially lessen significant environmental effects. These measures must be fully enforceable through permit conditions, agreements, or other measures.

(e) The public agency shall specify the location and custodian of the documents or other materials which constitute the record of the proceedings upon which its decision is based.

(f) A statement made pursuant to Section 15093 does not substitute for the findings required by this section.

The City, serving as the CEQA lead agency, finds and declares that the proposed Locust Gateway Development Project (State Clearinghouse No. 2024061274) has been completed in compliance with CEQA and the CEQA Guidelines. The City finds and certifies that the EIR was reviewed and that information contained in the EIR was considered prior to approving the proposed Locust Gateway Development Project, hereinafter referred to as the "Project".

Having received, reviewed and considered the EIR for the Project, as well as all other information in the record of proceedings on this matter, the Findings of Fact included in this document are hereby adopted by the City in its capacity as the CEQA lead agency. Based upon its review of the EIR, the City finds that the EIR is an adequate assessment of the potentially significant environmental impacts of the proposed Project; represents the independent judgment of the City; and sets forth an adequate range of alternatives to the Project.

The City has exercised independent judgment, in accordance with PRC § 21082.1(c)(3), in the preparation of the DEIR, the review of materials prepared by the Project Applicant and its

consultants, and the preparation of the Final EIR based on comments received during the public comment process.

Having received, reviewed, and considered the information in the DEIR and FEIR, as well as any and all other information in the record, the City hereby makes these Findings pursuant to and in accordance with PRC §§ 21081, 21081.5, and 21081.6, and add a brief description of these codes.

For purposes of CEQA and these Findings, the record of proceedings for the City's Findings and determinations includes, but is not limited to, the following documents, which were considered by the City prior to taking action on the proposed Project and adopting these Findings:

- Locust Gateway Development Project DEIR, including Technical Studies;
- Notice of Preparation (NOP), Notice of Completion (NOC), Notice of Availability (NOA), Notice of Determination (NOD) and all other public notices issued by the City in conjunction with this process;
- Comment Letters Received and Responses to Comments on the DEIR, including all written comments submitted by public agencies and members of the public during the public review period established by the NOC and included in the FEIR;
- Corrections and Changes from the DEIR to the Final EIR;
- Other site-specific and/or Project-specific technical studies and exhibits not included in the Final Environmental Impact Report (FEIR) but explicitly referenced therein;
- Mitigation Monitoring and Reporting Program;
- All written and verbal public testimony presented during public hearings for the proposed Project at which public testimony was taken, including Planning Commission and City Council hearings held as described under Section 3.0 of these Findings of Fact;
- All Project information submitted by the Applicant in its application to the City relating to the Project and/or the FEIR;
- All agendas, staff reports, and approved minutes of the City's Planning Commission and City Council relating to the proposed Project; and
- All other public reports, documents, studies, memoranda, maps, or other planning documents relating to the Project, the DEIR, or the FEIR, prepared by the City, consultants to the City, or responsible or trustee agencies.

All acronyms used herein shall have the meaning as defined in the DEIR unless otherwise noted.

1.2 CUSTODIAN AND LOCATION OF RECORDS.

The documents and other materials that constitute the administrative record for the City's approval of the EIR and actions related to the Project are located at the City of Rialto Community Development Department, Planning Division, 150 South Palm Avenue, Rialto, CA 92376. The City of Rialto is the custodian of the Project's administrative record. Copies of the documents and

other materials that constitute the record of proceedings are, at all relevant times have been, and will be available upon request directed to the City of Rialto Community Development Department.

2.0 PROJECT DESCRIPTION

2.1 INTRODUCTION.

The DEIR was prepared pursuant to CEQA (California Public Resources Code, Sections 21000, et seq.) to assess the potential environmental effects of the Locust Gateway Development Project, which would develop an approximately 664,859-square-foot (sf) warehouse, inclusive of approximately 7,713 sf of ancillary office space, 365 vehicle parking stalls, 398 trailer parking stalls, and a fence-secured dock area with 82 docks on an approximately 40-acre site located at the southwest corner of Locust Avenue and Lowell Street. The Project site is currently vacant and undeveloped, with the exception of remnants of a World War II-era bunker and rail spurs in the southern portion of the Project site. The majority of the site is covered in non-native grassland and previously disturbed land.

The Project proposes three new driveways on Lowell Street and one driveway on Locust Avenue. The driveway shown on the site plan on Lake Padden Lane would be provided exclusively for emergency access purposes with no truck or passenger vehicle access. The Project would be constructed using concrete tilt-up panels with architectural treatments for visual relief along the building facades. The warehouse would be white and grey with blue accents and blue window glazing.

2.2 PROJECT GOALS AND OBJECTIVES.

CEQA Guidelines Section 15124(b) requires "A statement of objectives sought by the proposed Project. A clearly written statement of objectives would help the lead agency develop a reasonable range of alternatives to evaluate in the EIR and would aid the decision-makers in preparing findings or a statement of overriding considerations, if necessary. The statement of objectives should include the underlying purpose of the project." The following objectives have been identified for the Project:

Objective 1: Develop and operate a warehouse that is in close proximity to three major freeways (State Route 210, Interstate 215 and Interstate 15) to support the distribution of goods throughout the region and that also limits traffic truck disruption to residential areas within the City and neighboring jurisdictions.

Objective 2: Develop and operate a warehouse that maximizes the efficient use of a vacant and underutilized and environmentally constrained site near available infrastructure, to allow the City of Rialto to compete on a domestic and international scale through the efficient and cost-effective movement of goods.

Objective 3: Develop a warehouse in an appropriate location that is predominantly surrounded by other industrial uses and is consistent with the Project site's General Manufacturing land use designation under the Rialto Airport Specific Plan.

Objective 4: Maximize the efficient movement of goods throughout the region by locating a warehouse development in close proximity to the Ports of Los Angeles and Long Beach.

Objective 5: Develop and operate an attractive warehouse development in the City of Rialto that meets industry standards for operational design criteria that will attract quality tenants and that will be competitive with other similar facilities in the region.

Objective 6: Positively contribute to the economy of the City of Rialto through new capital investment, expansion of the tax base and creation of new employment opportunities, including opportunities for highly trained workers.

Objective 7: Provide local employment for residents of the City to improve jobs-housing balance within the City, thereby reducing the need for members of the local workforce to commute outside the Project vicinity to work.

Objective 8: Provide infrastructure improvements including street and sidewalk improvements to Lowell Street and Locust Avenue, undergrounding of existing utilities, and drainage and water quality treatment improvements.

Objective 9: Develop a project that does not contribute to surface and groundwater quality degradation by treating surface and stormwater flows.

2.3 REQUIRED DISCRETIONARY ACTIONS AND PERMITS.

Pursuant to CEQA Guidelines Section 15121, an EIR is primarily an informational document intended to inform the public agency decision-makers and the general public of the potentially significant environmental effects of a project. Prior to taking action on the proposed Project, the City must consider the information in this EIR and certify the Final EIR. This EIR is intended to provide decision-makers of the City, other public agencies, and members of the public with the relevant environmental information needed in considering the Project. Anticipated project-related discretionary and ministerial approvals, and permits include, but are not limited to the following, to implement the Project addressed in this EIR:

- Certification of EIR
- Precise Plan of Design (PPD 2023-0041)
- Conditional Development Permit (CDP 2023-0032)
- Tentative Parcel Map (TPM 2023-0006) to create one parcel and one lettered lot, and to depict the required City right-of-way dedication for Lowell Street, vacations, and easements.
- Development Agreement (DA 2024-0002)

For this Project, the California Department of Fish and Wildlife (CDFW) is a trustee and responsible agency, because the Project has the potential to impact a wildlife species (Crotch's bumblebee) which is managed and protected by the State. The Santa Ana Regional Water Quality Control Board is also a responsible agency with respect to water quality. Approvals from these agencies would include:

- **Santa Ana Regional Water Quality Control Board (RWQCB)**: Issuance of a National Pollution Discharge Elimination System (NPDES) Permit and Construction General Permit.
- **CDFW:** Issuance of an Incidental Take Permit for the Crotch's bumblebee.

In addition to the approvals identified above, the Project may be subject to other discretionary and ministerial permits and approvals that may be necessary, including, but not limited to, site development permits, grading permits, sign permits, and building permits.

2.4 OTHER CEQA DOCUMENTS REFERENCED.

Under Section 15150 of the CEQA Guidelines, an EIR may incorporate by reference all or portions of another document that are a matter of public record or are generally available to the public. The previously prepared EIRs and environmental analyses listed below were relied upon or consulted in the preparation of the Project's EIR and were incorporated by reference:

- Rialto 2010 General Plan Update and General Plan Update and Related Zoning Ordinance Amendments EIR.
- 2023 City of Rialto Focused General Plan Update.
- City of Rialto Municipal Code, Title 18 – Zoning.

3.0 ENVIRONMENTAL REVIEW/PUBLIC PARTICIPATION.

The City conducted an extensive review of this Project, which included a DEIR and a Final EIR, including related technical reports, which were subject to a public review and comment period. The following is a summary of the City's environmental review of this Project:

- On June 27, 2024, the City circulated a Notice of Preparation ("NOP") identifying the environmental issues to be analyzed in the Project's EIR to the State Clearinghouse, responsible agencies, and other interested parties.
- The NOP public review period ran for 30 days. Written comments on the NOP were received from various agencies. The scope of the issues identified in the comments expressing concern included potential impacts associated with tribal cultural resources and biological resources.
- An EIR Scoping Meeting was held on July 11, 2024, at 6:00 PM at the Rialto City Hall Council Chambers, located at 150 S. Palm Avenue in the City of Rialto. No

agencies or interested parties attended the Scoping Meeting; only City staff and the City's EIR consultant were in attendance.

- The DEIR was circulated for public review for a 45-day review period. The Notice of Availability/Notice of Completion 45-day review period was from September 5, 2025 to October 20, 2025. The State Clearinghouse 45-day review period was from September 8, 2025 to October 22, 2025.
- The City received a total of 8 comment letters on the DEIR. The City prepared specific responses to comments. The responses to comments are in Section 2.0 of the Final EIR.
- On December 17, 2025, the City of Rialto Planning Commission conducted a duly noticed public hearing to consider the Project and voted X-X to recommend approval to the City Council.
- On _____, the City Council conducted a duly noticed public hearing to consider the Project. The City Council, after considering written comments and oral testimony on the EIR, determined that no new information was presented that would require recirculation of the EIR. Following public testimony, submission of additional written comments, and staff recommendations, the City Council decided to certify the EIR, adopt these Findings and to take action to approve the Project as recommended by the Staff Report.

4.0 INDEPENDENT JUDGMENT AND FINDING.

Kimley-Horn and Associates, Inc. ("Kimley-Horn") was retained by the applicant to prepare the EIR. Kimley-Horn prepared the EIR under the supervision, direction and review of the City's planning staff, along with a third-party peer review.

Finding: The EIR for the Project reflects the City's independent judgment. The City has exercised independent judgment in accordance with Public Resources Code Section 21082.1(c)(3) in directing the consultant in the preparation of the EIR, as well as reviewing, analyzing and revising material prepared by the consultant.

4.1 GENERAL FINDING ON MITIGATION MEASURES.

In preparing the discretionary actions and permits for this Project, City staff incorporated the mitigation measures recommended in the EIR as applicable to the Project. In the event that the discretionary actions and permits do not use the exact wording of the mitigation measures recommended in the EIR, in each such instance, the adopted discretionary actions and permits are intended to be identical or substantially similar to the recommended mitigation measure. Any minor revisions were made for the purpose of improving clarity or to better define the intended purpose.

Finding: Unless specifically stated to the contrary in these findings, it is the City's intent to adopt all mitigation measures recommended by the EIR, which are applicable to the Project. If a measure has, through error, been omitted from the discretionary

actions and permits or from these Findings, and that measure is not specifically reflected in these Findings, that measure shall be deemed adopted pursuant to this paragraph. In addition, unless specifically stated to the contrary in these Findings, all discretionary actions and permits repeating or rewording mitigation measures recommended in the EIR are intended to be substantially similar to the mitigation measures recommended in the EIR and are found to be equally effective in avoiding or lessening the identified environmental impact. In each instance, the approvals contain the final wording for the mitigation measures.

5.0 ENVIRONMENTAL IMPACTS AND FINDINGS

As discussed in more detail below, these Findings of Fact are intended to meet the requirements of CEQA Guidelines Sections 15091 and 15093. City staff reports, the EIR, written and oral testimony at public meetings or hearings, these Facts and Findings and other information in the administrative record, serve as the basis for the City's environmental determination.

Detailed analysis of potentially significant environmental impacts and proposed mitigation measures for the Project is presented in Section 4.1 to Section 4.17 of the DEIR, as modified in Section 3.0 of the Final EIR. Responses to comments from the public and from other government agencies on the EIR are provided in Section 2.0 of the Final EIR.

As discussed in Section 5 of the DEIR, the Project was determined to not result in any impacts to the following environmental categories:

- Aesthetics and Visual Resources (would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State Scenic Highway?);
- Agricultural and Forestry Resources (all issue areas);
- Biological Resources (would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State habitat conservation plan?);
- Geology and Soils (related to rupture of a known earthquake fault, landslides, septic tanks/alternative wastewater disposal systems);
- Hazards and Hazardous Materials (issue areas related to noise and hazards from airport land use plans/proximity to public airport, and wildland fires);
- Land Use and Planning (with regard to the physical division of an established community);
- Noise (excessive noise within airport land use plan or within two miles of public airport)
- Population and Housing (would the Project displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?);

- Public Services (with regard to schools, parks, and other public services);
- Recreation (all issue areas); and
- Wildfire (all issue areas).

Therefore, these topics were not discussed in detail within Section 4 of the DEIR. The City Council concurs with the respective conclusions of Section 5 of the DEIR that the Project would not result in any impacts related to these issue areas.

The DEIR evaluated 17 major environmental categories for potential impacts: Aesthetics; Air Quality; Biological Resources; Cultural Resources; Energy; Geology and Soils; Greenhouse Gas Emissions; Hazards and Hazardous Materials; Hydrology and Water Quality, Land Use and Planning, Mineral Resources, Noise, Population and Housing; Public Services, Transportation, Tribal Cultural Resources; and Utilities and Service Systems. Both Project-specific and cumulative impacts were evaluated.

Of these 17 major environmental categories, the City Council concurs with the conclusions in the EIR that the issues and sub issues discussed in Section 5.1 below are less than significant without the need for mitigation; and that the issues and sub issues discussed in Section 5.2 below can be mitigated below a level of significance.

5.1 IMPACTS THAT ARE LESS THAN SIGNIFICANT WITHOUT THE NEED FOR MITIGATION.

The City Council finds that impacts of the Project related to Aesthetics, Energy, Hydrology and Water Quality, Land Use and Planning, Mineral Resources, Population and Housing, Public Services, Transportation and Utilities and Service Systems (all issue areas) and their respective cumulative impacts are less than significant without the need for mitigation, in whole or in part due to various features that have been incorporated into the Project, including mandatory compliance with applicable standards under CALGreen, Title 24 and other regulations, Laws, Ordinances, and Regulations (LORs), City Standard Conditions, Project location and setting, and operational characteristics, as discussed in the respective topical subsections within Section 4 of the DEIR.

LORs are existing requirements that are based on local, State, or federal regulations or laws that are frequently required independently of CEQA review. Typical LORs include compliance with the provisions of the California Building Code, local agency, etc. The City may impose additional conditions during the approval process, as appropriate. Because LORs are neither Project-specific nor a result of development of the Project, they are not considered to be either Project Design Features or Mitigation Measures. However, they are included in the Mitigation Program to comprehensively identify Project requirements.

With respect to Air Quality, Biological Resources, Cultural Resources, Geology and Soils, Greenhouse Gases, Hazards and Hazardous Materials, Noise and Transportation, the City Council finds that with the exception of those specific sub-issue areas identified in Section 5.2 below as

requiring mitigation, or in Section 5.3 as significant and unavoidable impacts, all other impacts of the Project are less than significant without the need for mitigation.

5.2 POTENTIALLY SIGNIFICANT IMPACTS WHICH CAN BE MITIGATED BELOW A LEVEL OF SIGNIFICANCE WITH MITIGATION MEASURES.

Public Resources Code Section 21081 and CEQA Guidelines Section 15091(a)(1) state that no public agency shall approve or carry out a project for which an EIR has been completed, which identifies one or more significant effects unless the public agency finds that changes or alterations have been required in, or incorporated into, the project, which mitigate or avoid the significant effects on the environment.

The following issues from the environmental categories analyzed in the EIR, including Air Quality, Biological Resources, Cultural Resources, Geology and Soils, Greenhouse Gases, Hazards and Hazardous Materials, Noise, and Tribal Cultural Resources were found to be potentially significant, but can be mitigated to a less than significant level with the imposition of mitigation measures. The City Council hereby finds pursuant to Public Resources Code Section 21081 and CEQA Guidelines Section 15091(a)(1) that all potentially significant Project-level and cumulative impacts related to the environmental categories listed below can and will be mitigated to below a level of significance by imposition of the mitigation measures in the EIR; and that these mitigation measures are included as Conditions of Approval and set forth in the MMRP adopted by the City Council. Specific findings for each category of such impacts are set forth in detail below.

Each mitigation measure discussed in this Section of the findings has a letter and number code correlating it with the environmental category used in the DEIR and MMRP.

5.2.1 Air Quality

Potential Significant Impact (Thresholds 4.2-1, 4.2-2, 4.2-3 and 4.2-4): The EIR evaluated and concluded that the Project would potentially conflict with or obstruct implementation of the applicable air quality plan; result in a cumulatively considerable net increase of criteria pollutants for which the Project region is non-attainment under an applicable federal or State ambient air quality standard during operations; expose sensitive receptors to substantial pollutant concentrations; and result in cumulative air quality impacts.

Finding: Based on the entire record, the City Council finds that these impacts are potentially significant but can each be mitigated to a less than significant level through implementation of Mitigation Measures AQ-1, AQ-2, AQ-3, AQ-4 and AQ-5. The Mitigation Measures are adopted and incorporated into the MMRP for the Project and will be implemented as specified therein, thereby reducing these potentially significant impacts to a less than significant level. The impacts related to this issue area are discussed in detail in Section 4.2 of the DEIR. In addition, LORs AQ-1 to AQ-5, although not considered mitigation, are included in the MMRP to comprehensively identify Project requirements. The following Mitigation Measures will mitigate Project-level and cumulative impacts related to air quality

to below a level of significance:

Mitigation Measures

MM AQ-1 Low VOC Paints. The Project shall use "Super-Compliant" low VOC paints which have been reformulated to exceed the regulatory VOC limits (i.e., have a lower VOC content than what is required) put forth by SCAQMD's Rule 1113 for all architectural coatings. Super-Compliant low VOC paints shall be no more than 10 g/L of VOC. Prior to issuance of a building permit, the City shall confirm that plans include the following specifications:

- All architectural coatings will be super-compliant low VOC paints.
- Recycle leftover paint. Take any leftover paint to a household hazardous waste center; do not mix leftover water-based and oil-based paints.
- Keep lids closed on all paint containers when not in use to prevent VOC emissions and excessive odors.
- For water-based paints, clean up with water only. Whenever possible, do not rinse the cleanup water down the drain or pour it directly into the ground or the storm drain. Set aside the can of cleanup water and take it to the hazardous waste center (www.cleanup.org).
- Use compliant low-VOC cleaning solvents to clean paint application equipment.
- Keep all paint- and solvent-laden rags in sealed containers to prevent VOC emissions.
- Contractors shall construct/build with materials that do not require painting and use pre-painted construction materials to the extent practicable.
- Use high-pressure/low-volume paint applicators with a minimum transfer efficiency of at least 50 percent or other application techniques with equivalent or higher transfer efficiency.

MM AQ-2 Require All-Electric Development. Prior to the issuance of building permits, the Building Department shall confirm that building plans require the Project to use all-electric appliances, and end uses instead of natural gas. The Project shall not include natural gas utility lines or connections. The purpose of this mitigation measure is to reduce air quality emissions from natural gas.

MM AQ-3 Electric Landscape Equipment. Prior to the issuance of occupancy permits, the Planning Division shall confirm that the Project's Covenants, Conditions and Restrictions (CC&Rs) and/or tenant lease agreements include contractual language that all handheld landscaping equipment used on site shall be 100 percent electrically powered. The logistics warehouse and parking lots shall be equipped with exterior electrical outlets to accommodate this requirement. This requirement shall be included in the third-party vendor agreements for landscape services for the building owner and tenants, as applicable. This mitigation measure applies only to tenant improvements and not the building shell approvals.

MM AQ-4 Transportation Demand Management. Prior to the issuance of tenant occupancy permits, the tenant/facility operator shall prepare and submit a Transportation Demand Management (TDM) program detailing strategies that would reduce the use of single occupant vehicles by employees by increasing the number of trips by walking, bicycle, carpool, vanpool and transit. The TDM shall include measures such as, but not limited to the following:

- Provide a transportation information center and on-site TDM coordinator to educate residents, employers, employees, and visitors of surrounding transportation options.
- Promote bicycling and walking through design features such as showers for employees, self-service bicycle repair area, etc. around the project site.
- Each building shall provide secure bicycle storage space equivalent to two percent of the automobile parking spaces provided.
- Each building shall provide a minimum of two shower and changing facilities as part of the tenant improvements.
- Provide on-site car share amenities for employees who make only occasional use of a vehicle, as well as others who would like occasional access to a vehicle of a different type than they use day-to-day.
- Promote and support carpool/vanpool/rideshare use through parking incentives and administrative support, such as ride-matching service.
- Incorporate incentives for using alternative travel modes, such as preferential load/unload areas or convenient designated parking spaces for carpool/vanpool users.
- Provide meal options onsite or shuttles between the facility and nearby meal destinations.
- Each building shall provide preferred parking for electric, low-emitting and fuel efficient vehicles equivalent to at least eight percent of the required number of parking spaces.

This mitigation measure applies only to tenant occupancy and not the building shell approvals.

MM AQ-5 Non-Diesel Cargo Handling Equipment. The warehouse building shall include the necessary charging stations for cargo handling equipment. Prior to the issuance of a tenant occupancy permit, the Planning Division shall confirm that the Project plans and specifications show that all outdoor cargo handling equipment (including yard trucks, hostlers, yard goats, pallet jacks, and forklifts) are zero emission or alternatively fueled (i.e., powered by electricity or non-diesel fuels). The building manager or their designee shall be responsible for enforcing these requirements. Note that SCAQMD Rule 2305 (Warehouse Indirect Source Rule) Warehouse Actions and Investments to Reduce Emissions (WAIRE) points may be earned for electric/zero emission yard truck/hostler usage. This mitigation measure applies only to tenant improvements and not the building shell approvals.

Facts in Support of the Finding:

Threshold 4.2-1: Conflict with or obstruct implementation of the applicable air quality plan

The Project site is located within the South Coast Air Basin (SCAB), which is under the jurisdiction of the South Coast Air Quality Management District (SCAQMD). The SCAQMD is required to reduce emissions of criteria pollutants for which the SCAB is in nonattainment. To reduce such emissions, the SCAQMD drafted the 2016 and 2022 Air Quality Management Plans (AQMPs). The AQMPs establish a program of rules and regulations directed at reducing air pollutant emissions and achieving State (California) and national air quality standards. The pollutant control strategies in the AQMPs are based on the latest scientific and technical information and planning assumptions, including Southern California Association of Government's (SCAG's) 2020 Connect SoCal, updated emission inventory methodologies for

various source categories, and SCAG's latest growth forecasts. SCAG's latest growth forecasts were defined in consultation with local governments and with reference to local general plans. The Project is subject to the SCAQMD's AQMPs. Criteria for determining consistency with the AQMPs are defined by the following indicators:

- Consistency Criterion No. 1: The Project will not result in an increase in the frequency or severity of existing air quality violations, or cause or contribute to new violations, or delay the timely attainment of air quality standards or the interim emissions reductions specified in the AQMPs.

- Consistency Criterion No. 2: The Project will not exceed the assumptions in the AQMPs or increments based on the years of the Project build-out phase.

According to the SCAQMD's CEQA Air Quality Handbook, the purpose of the consistency finding is to determine if a project is inconsistent with the assumptions and objectives of the regional air quality plans, and thus if it would interfere with the region's ability to comply with state and federal ambient air quality standards. As identified in **DEIR Table 4.2-8**: **Construction-Related Emissions**, the proposed Project would not exceed construction emission standards with implementation of Mitigation Measure (MM) AQ-1. Further, the Project would not exceed operational emission standards with implementation of MM AQ-2 through MM AQ-5. (**DEIR Table 4.2-9: Operational Emissions**). Therefore, the Project is consistent with the first criterion.

Concerning Consistency Criterion No. 2, the AQMPs contain air pollutant reduction strategies based on SCAG's latest growth forecasts, and SCAG's growth forecasts were defined in consultation with local governments and with reference to local general plans. The Project would not result in a change of land use designations reflected in the AQMP and is assumed to be consistent with the AQMPs regional emissions inventory for the SCAB. Therefore, the Project is consistent with the second criterion.

The City's population estimate, as of January 2023, is 102,985 persons. While the Project does not involve residential development, the Project is anticipated to generate approximately 558 employees and could indirectly induce population growth if future employees move into the City to work at the proposed Project. However, the Project would consist of a source of employment within a City with substantial housing stock. Therefore, it is likely that the Project would employ current residents of the City. In the event that the operator of the proposed facility draws employees that are not from the local community, the Project would not directly result in the development of new housing.

As the Project would not directly result in the development of new housing, the Project would not cause the Rialto General Plan buildout population forecast to be exceeded. The population and employment forecasts, which are adopted by SCAG's Regional Council, are based on the local plans and policies applicable to the City. Additionally, as the SCAQMD has incorporated these same projections into the AQMPs, it can be concluded that the proposed Project would be consistent with the projections. Thus, no impact would occur, as the Project is also consistent with the second criterion.

Future tenant(s) of the Project would also be required to comply with SCAQMD Rule 2305, which would directly reduce NO_X and particulate matter emissions (refer to South Coast Air Quality Management District under Section 4.2.2: Regulatory Setting). The Project would not conflict with or obstruct implementation of the AQMPs or any applicable air quality plan. Impacts would be less than significant with the incorporation of MMs AQ-1 through AQ-5. (**DEIR at 4.2-20 to 4.2-21**).

Threshold 4.2-2: Cumulatively considerable net increase of criteria pollutants

Construction Emissions

Construction associated with the Project would generate short-term emissions of criteria air pollutants. The criteria pollutants of primary concern in the area include O_3-precursor pollutants (i.e., ROG and NO_X) and particulate matter (PM_{10} and $PM_{2.5}$). Construction-generated emissions are short term and of temporary duration, lasting only as long as construction activities occur but would be considered a significant air quality impact if the volume of pollutants generated exceeds the SCAQMD's thresholds of significance.

Construction results in the temporary generation of emissions resulting from site grading, road paving, motor vehicle exhaust associated with construction equipment and worker trips, and the movement of construction equipment, especially on unpaved surfaces. Emissions of airborne particulate matter are largely dependent on the amount of ground disturbance associated with site preparation activities as well as weather conditions and the appropriate application of water.

Construction of the Project is anticipated to begin in 2025 and is estimated to be completed within approximately 15 months. Construction-generated emissions associated with the Project were calculated using the California Air Resources Board (CARB)-approved CalEEMod computer program. Predicted maximum daily construction-generated emissions for the Project are summarized in **DEIR Table 4.2-8: Construction-Related Emissions**. Due to technology improvements for construction equipment, emissions from Project construction activities would likely be lower than those shown in the table if construction were to occur in later years. Fugitive dust emissions may have a substantial, temporary impact on local air quality. In addition, fugitive dust may be a nuisance to those living and working in the area. Uncontrolled dust from construction can become a nuisance and potential health hazard to those living and working nearby. SCAQMD Rules 402 and 403 (prohibition of nuisances, watering of inactive and perimeter areas, track out requirements, etc.), are applicable to the Project and were applied in CalEEMod to minimize fugitive dust emissions. Rule 1113 provides specifications on painting practices and regulates the ROG content of paint. The Project would be required to comply with SCAQMD rules and regulations, including SCAQMD Rules 402, 403, and 1113. **DEIR Table 4.2-8** shows that unmitigated total construction emissions would exceed the SCAQMD threshold for ROG (VOC). Most ROG emissions are generated during the architectural coating phase of construction. Therefore, MM AQ-1 requires the Project to use low VOC paints. With implementation of MM AQ-1, total construction ROG emissions would be below SCAQMD thresholds; impacts would be less than significant. **(DEIR at 4.2-21 to 4.2-22)**.

Operational Emissions

Project-generated emissions would be primarily associated with motor vehicle use and area sources, such as the use of landscape maintenance equipment and architectural coatings. Long-term operational emissions attributable to the Project are summarized in **DEIR Table 4.2-9: Operational Emissions**. The table shows that unmitigated emissions would not exceed SCAQMD thresholds with the exception of NO_X. Therefore, regional unmitigated operational emissions would result in a potentially significant long-term regional air quality impact.

The majority of NO_X emissions are from mobile sources and on-site cargo handling equipment (i.e., forklifts and yard trucks). Mitigation measures would be required to reduce emissions to the maximum extent feasible; however, motor vehicle engine emissions are controlled by State and federal standards and the Project has no control over these standards. Nonetheless, through implementation of MM AQ-2 through MM AQ-5, the Project's operational emissions would be reduced to a less than significant level. MM AQ-2 requires the Project to use all-electric appliances and end uses instead of natural gas, as well as prohibits installation of natural gas utility lines or connections. MM AQ-3 requires landscaping equipment to be 100 percent electric. MM AQ-4 requires the implementation of a Transportation Demand Management (TDM) program to reduce single-occupant vehicle trips and encourage public transit. Mitigated emissions shown in **DEIR Table 4.2-9** do not account for emissions reductions associated with MM AQ-4. MM AQ-5 requires outdoor cargo handling equipment to be zero emissions or alternatively fueled. **DEIR Table 4.2-9** shows that with implementation of MM AQ-2, MM AQ-3, and MM AQ-5, all criteria pollutant emissions would be below SCAQMD thresholds. Therefore, impacts would be less than significant with implementation of MM AQ-2, MM AQ-3, MM AQ-4, and MM AQ-5.

In addition, pursuant to SCAQMD Rule 2305, all warehouses over 100,000 sf are required to implement various emission reduction measures related to warehouse operations and mobile sources. Compliance with SCAQMD Rule 2305 would further reduce criteria pollutants, specifically NO_X and particulate matter emissions. (**DEIR at 4.2-22 to 4.2-23**).

Threshold 4.2-3: Expose sensitive receptors to substantial pollutant concentrations

Localized Construction Impacts

The nearest sensitive receptors are single-family residences located approximately 700 feet (213 meters) to the east of Locust Avenue. Localized significance thresholds (LSTs) are provided for distances to sensitive receptors of 25, 50, 100, 200, and 500 meters. Therefore, LSTs for receptors located at the interpolated distance of 213 meters were used in the DEIR's analysis consistent with SCAQMD methodology. **DEIR Table 4.2-11: Localized Significance of Construction Emissions** presents the results of localized emissions during each construction phase. The table shows that emissions of these pollutants on the peak day of construction would not result in significant concentrations of pollutants at nearby sensitive receptors. (**DEIR at 4.2-25**).

Localized Operational Impacts

According to the SCAQMD LST methodology, LSTs would apply to the operational phase of a project only if it includes stationary sources or attracts mobile sources that may spend long periods

queuing and idling at the site (e.g., warehouse or transfer facilities). Since the Project includes a warehouse, the operational phase LST protocol was conservatively applied to both the area source and a portion of the mobile source emissions for operations. LSTs thresholds for receptors located at 213 meters in SRA 34 were used in this analysis because the closest receptors to the Project site are located approximately 700 feet (213 meters) to the east of Locust Avenue. Although the Project site is approximately 40 acres, the 5.0-acre LST threshold was conservatively used for the Project, as the LSTs increase with the size of the site. For a worst-case scenario assessment, the emissions shown in **DEIR Table 4.2-12: Localized Significance of Operational Emissions** conservatively include all on-site Project-related stationary sources and three percent of mobile sources. The table shows that the unmitigated maximum daily emissions of these pollutants for Project operations would not result in significant concentrations of pollutants at nearby sensitive receptors. **(DEIR at 4.2-26)**.

Criteria Pollutant Health Impacts

The SCAQMD has set its CEQA significance thresholds based on the Federal Clean Air Act (FCAA), which defines a major stationary source (in extreme ozone nonattainment areas such as the SCAB) as emitting 10 tons per year. The thresholds correlate with the trigger levels for the federal New Source Review Program and SCAQMD Rule 1303 for new or modified sources. The New Source Review Program was created by the FCAA to ensure that stationary sources of air pollution are constructed or modified in a manner that is consistent with the attainment of health-based federal ambient air quality standards. The federal ambient air quality standards establish the levels of air quality necessary, with an adequate margin of safety, to protect the public health. Therefore, Projects that do not exceed the SCAQMD's LSTs and mass emissions thresholds would not violate any air quality standards or contribute substantially to an existing or projected air quality violation and no criteria pollutant health impacts.

As discussed above, localized effects of on-site Project emissions on nearby receptors were found to be less than significant (**DEIR Table 4.2-11 and Table 4.2-12**). The LSTs represent the maximum emissions from a Project that are not expected to cause or contribute to an exceedance of the most stringent applicable State or federal ambient air quality standard. The LSTs were developed by the SCAQMD based on the ambient concentrations of that pollutant for each SRA and distance to the nearest sensitive receptor. The ambient air quality standards establish the levels of air quality necessary, with an adequate margin of safety, to protect public health, including protecting the health of sensitive populations. Information on health impacts related to exposure to ozone and particulate matter emissions published by the U.S. EPA and CARB have been summarized and discussed in the Regulatory Section (**DEIR Table 4.2-3**). Project-related emissions would not exceed the regional thresholds or the LSTs with implementation of MM AQ-1 through MM AQ-5 and therefore would not exceed the ambient air quality standards or cause an increase in the frequency or severity of existing violations of air quality standards. Therefore, sensitive receptors would not be exposed to criteria pollutant levels in excess of the health-based ambient air quality standards. **(DEIR at 4.2-27)**.

Carbon Monoxide (CO) Hotspots

An analysis of CO "hot spots" is needed to determine whether the change in the level of service of an intersection resulting from the Project would have the potential to result in exceedances of the state or federal ambient air quality standards. It has long been recognized that CO exceedances are caused by vehicular emissions, primarily when vehicles are idling at intersections. Vehicle emissions standards have become increasingly stringent in the last 20 years. Currently, the CO standard in California is a maximum of 3.4 grams per mile for passenger cars (requirements for certain vehicles are more stringent). With the turnover of older vehicles, introduction of cleaner fuels, and implementation of control technology on industrial facilities, CO concentrations have steadily declined. Accordingly, with the steadily decreasing CO emissions from vehicles, even very busy intersections do not result in exceedances of the CO standard.

The SCAB was re-designated as attainment for CO in 2007 and is no longer addressed in the SCAQMD's AQMP. The 2003 AQMP is the most recent version that addresses CO concentrations. As part of the SCAQMD CO Hotspot Analysis, the Wilshire Boulevard and Veteran Avenue intersection, one of the most congested intersections in Southern California with an average daily traffic (ADT) volume of approximately 100,000 vehicles per day, was modeled for CO concentrations. This modeling effort identified a CO concentration high of 4.6 ppm, which is well below the 35-ppm federal standard. The Project considered herein would not produce the volume of traffic required to generate a CO hot spot in the context of SCAQMD's CO Hotspot Analysis. As the CO hotspots were not experienced at the Wilshire Boulevard and Veteran Avenue intersection even as it accommodates 100,000 vehicles daily, it can be reasonably inferred that CO hotspots would not be experienced at any intersections in the vicinity of the Project site resulting from 1,138 daily vehicle trips attributable to the Project. Therefore, impacts would be less than significant. **(DEIR at 4.2-28)**.

Health Risk Assessment

As the Project site is near existing sensitive receptors (i.e., single-family residential uses located approximately 700 feet to the east and southeast of the Project site), an analysis of diesel particulate matter (DPM) was performed using the U.S. EPA-approved AERMOD model. The SCAQMD conducted an in-depth analysis of toxic air contaminants (TACs) and their resulting health risks for all of Southern California. The Multiple Air Toxics Exposure Study in the SCAB (MATES V) (August 2021) shows that carcinogenic risk from air toxics in the SCAB, based on the average concentrations at the 10 monitoring sites, is approximately 40 percent lower than the monitored average in MATES IV and 84 percent lower than the average in MATES II. MATES V also evaluated the population-weighted cancer risk within Environmental Justice (EJ) communities using the SB 535 definition of disadvantaged communities. Between MATES IV and MATES V, air toxic cancer risk decreased by 57 percent in EJ communities overall compared to a 53 percent reduction in non-EJ communities. MATES V is the most comprehensive dataset documenting the ambient air toxic levels and health risks associated with SCAB emissions. Therefore, the MATES V study represents the baseline health risk for a cumulative analysis. MATES V estimates the average excess cancer risk level from exposure to TACs is 424 in one million basin-wide. In comparison, the MATES IV basin's average risk was 897 per million. This steady downward trend in health risk is due in larger part due to stricter regulatory requirements and cleaner fuels and engines, which have resulted in improved regional air quality. These model estimates were based on monitoring data collected at ten fixed sites within the SCAB. None of the fixed monitoring sites

are near the Project site. However, MATES V has extrapolated the excess cancer risk levels throughout the SCAB by modeling the specific grids. MATES V modeling predicted an excess cancer risk of 455 in one million for the Project site area. (**DEIR at 4.2-28 to 4.2-29**).

With regard to carcinogenic risk, the Project (construction and operations combined scenario) would result in a maximum cancer risk of 1.41 in one million at the nearest residential receptors, 0.05 in one million at the nearest student receptors, and 1.21 in one million at the nearest worker receptors. Therefore, the SCAQMD threshold of 10 in one million would not be exceeded at the nearest receptors and impacts would be less than significant, as shown in **DEIR Table 4.2-13**. **DEIR Table 4.2-14: Chronic Hazard Assessment** shows the chronic non-cancer risk hazard index from Project construction and operational emissions. Chronic non-cancer risk hazard index of 1.0 or greater is considered individually significant. The highest maximum chronic hazard index associated with DPM emissions from Project construction would be 0.0007 at the residential receptors, 0.0002 at the student receptors, and 0.0082 at the worker receptors. Additionally, the highest maximum chronic hazard index associated with DPM emissions from Project operations would be 0.0003 at the residential receptors, 0.0001 at the student receptors, and 0.0039 at the worker receptors. There is no acute REL for DPM and acute health risk cannot be calculated. Therefore, non-carcinogenic hazards are calculated to be within acceptable limits and a less than significant impact would occur.

As concluded above, the Project's cancer and non-cancer risks from construction emissions would be less than significant, as both would be below the SCAQMD's thresholds of significance. This analysis assesses the Project's incremental contribution to health risk impacts, consistent with the SCAQMD guidance and methodology. The SCAQMD has not established separate cumulative thresholds and does not require combining impacts from cumulative projects. The SCAQMD considers projects that do not exceed the project-specific individual incremental thresholds to not be cumulatively significant. Therefore, because the Project's health risks (i.e., cancer and non-cancer) would not exceed the Project-specific incremental thresholds, the Project would not result in a cumulatively significant impact and the Project's contribution would be less than cumulatively considerable. (**DEIR at 4.2-29 to 4.2-30**).

Threshold 4.2-4: Objectionable odors

During construction, emissions from construction equipment, such as diesel exhaust, and VOCs from architectural coatings and paving activities may generate odors. However, these standard construction-related odors would be temporary, are not expected to affect a substantial number of people and would disperse rapidly. Therefore, the Project would comply with SCAQMD Rule 402, and impacts related to odors associated with the Project's construction-related activities would be less than significant and no mitigation is required.

Once operational, the SCAQMD CEQA Air Quality Handbook identifies certain land uses as potentially significant sources of odors. These land uses include agriculture (farming and livestock), wastewater treatment plants, food processing plants, chemical plants, composting facilities, refineries, landfills, dairies, and fiberglass molding. The Project would not include any of the land uses that have been identified by the SCAQMD as odor sources. Therefore, the Project would not create objectionable odors. Therefore, the Project would comply with SCAQMD Rule

402 and operational odor impacts would be less than significant and no mitigation is required. (**DEIR at 4.2-31 to 4.2-32**).

Cumulative Impacts

Cumulative Short-Term Emissions

The SCAB is designated nonattainment for O_3, PM_{10}, and $PM_{2.5}$ for State standards and nonattainment for O_3 and $PM_{2.5}$ for Federal standards. Appendix D of the SCAQMD White Paper on Potential Control Strategies to Address Cumulative Impacts from Air Pollution (2003) notes that projects that result in emissions that do not exceed the project-specific SCAQMD regional thresholds of significance should result in a less than significant impact on a cumulative basis unless there is other pertinent information to the contrary. Therefore, if a project is estimated to result in emissions that do not exceed the thresholds, the project's contribution to the cumulative impact on air quality in the SCAB would not be cumulatively considerable. Project construction-related emissions would not exceed the SCAQMD significance thresholds for criteria pollutants with the incorporation of MM AQ-1 (see **DEIR Table 4.2-8**). Likewise, the proposed Project would not generate a cumulatively considerable contribution to air pollutant emissions during construction with the incorporation of MM AQ-1.

The SCAQMD has developed strategies to reduce criteria pollutant emissions outlined in the AQMP pursuant to the FCAA mandates. The analysis assumed fugitive dust controls would be used during construction, including frequent water applications. SCAQMD rules, mandates, and compliance with adopted AQMP emissions control measures would also be imposed on other construction projects throughout the SCAB, which would include related cumulative projects. As concluded above, the Project's construction-related impacts would be less than significant. Compliance with SCAQMD rules and regulations would further minimize the proposed Project and other projects in the area construction-related emissions. Therefore, Project-related construction emissions, in combination with those from other projects in the area, would not substantially deteriorate the local air quality. The Project's construction-related emissions would not result in a cumulatively considerable contribution to significant cumulative air quality impacts. (**DEIR at 4.2-32**).

Cumulative Long-Term Impacts

The SCAQMD has not established separate significance thresholds for cumulative operational emissions for project specific impacts because the nature of air emissions is largely a cumulative impact. As a result, no single project is sufficient in size to, by itself, to result in nonattainment of ambient air quality standards. The SCAQMD developed the operational thresholds of significance based on the level above which individual project emissions would result in a cumulatively considerable contribution to the SCAB's existing air quality conditions. Therefore, a project that exceeds the SCAQMD operational thresholds would also be a cumulatively considerable contribution to a significant cumulative impact.

Project operational emissions would not exceed the SCAQMD thresholds with the incorporation of MM AQ-2 through MM AQ-5 (**Draft EIR Table 4.2-9**). As a result, operational emissions

associated with the Project would not represent a cumulatively considerable contribution to significant cumulative air quality impacts. Therefore, operational emissions associated with the Project would not result in a cumulatively considerable contribution to significant cumulative air quality impacts. (**DEIR at 4.2-32 to 4.2-33**).

5.2.2 Biological Resources

Potential Significant Impact (Threshold 4.3-1): The EIR evaluated and concluded that the Project could have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or the U.S. Fish and Wildlife Service.

Finding: Based on the entire record, the City Council finds that this impact is potentially significant but can be mitigated to a less than significant level through implementation of Mitigation Measures BIO-1 to BIO-6. The Mitigation Measures are adopted and incorporated into the MMRP for the Project and will be implemented as specified therein, thereby reducing this potentially significant impact to a less than significant level. The impacts related to this issue area are discussed in detail in Section 4.3 of the DEIR. The following Mitigation Measures will mitigate Project-level and cumulative impacts to biological resources to below a level of significance:

Mitigation Measures

MM BIO-1 Rare Plant Mitigation Plan. Parry's spineflower (CRPR 1B.1) is present on site and impacts are unavoidable; therefore, compensatory mitigation shall be provided to offset impacts. A rare plant mitigation plan shall be prepared and implemented by the applicant or its designee prior to the onset of grading activities. The plan will demonstrate the feasibility of conserving, enhancing, or restoring Parry's spineflower habitat in areas to be managed as natural open space without conflicting with other resource management objectives. Habitat conservation, enhancement, or restoration will be at a minimum 1:1 ratio (acres conserved, enhanced, or restored to acres impacted).

If the rare plant mitigation plan proposes conservation of an extant population, the plan shall include, at a minimum: (a) the location of the conserved habitat and an analysis of its suitability as compensatory mitigation; (b) an assessment of the extant Parry's spineflower populations at the proposed conservation site; (c) a long-term management plan which includes objectives, management practices, monitoring protocols, adaptive management strategies, and reporting requirements; and (d) details regarding the establishment of a non-wasting endowment to perpetually fund management of the conserved land, or such other funding mechanism acceptable to CDFW.

If the rare plant mitigation plan proposes enhancement or restoration, the plan shall include at minimum: (a) collection/salvage measures for plants or seed banks, to retain intact soil conditions and maximize success likelihood; (b) details regarding storage of plants or seed banks; (c) location of the proposed recipient site, and detailed site preparation and plant introduction techniques

details for top soil storage, as applicable; (d) time of year that the salvage and replanting or seeding will occur and the methodology of the replanting; (e) a description of the irrigation, if used; (f) success criteria; and (g) detailed monitoring program, commensurate with the plan's goals.

MM BIO-2 Best Management Practices. To avoid impacts to special-status resources and inadvertent disturbance, the following monitoring requirements and Best Management Practices (BMPs) shall be implemented:

a. Construction vehicles shall not exceed 15 miles per hour on unpaved roads adjacent to the project site or the right-of-way accessing the site.

b. The Applicant, or its contractors, shall screen, cover, or elevate at least one foot above ground, all construction pipe, culverts, or similar structures with a diameter of three inches or greater that are stored on site overnight. These pipes, culverts, and similar structures shall be inspected by the Project biologist for wildlife before such material is moved, buried, or capped.

c. Construction activities shall occur during daytime hours to the greatest extent feasible. If construction must occur at nighttime, lights shall be oriented in such a way that they direct light downward and toward the active construction, ensuring that no direct light is emitted towards adjacent lands, and shields or deflectors shall be installed on lights to reduce light spill. Nighttime concrete pouring shall be performed in accordance with the City of Rialto Municipal Code.

d. A biologist shall flush special-status species (i.e., avian or other mobile species), with the exception of burrowing owl, from suitable habitat areas within the Project development footprint to the maximum extent practicable immediately (e.g., within 24 hours) prior to initial vegetation removal activities. The biologist shall flush wildlife by walking through habitats to be imminently removed and towards adjacent open space.

e. At the end of each workday during construction, the applicant, or its contractors, shall cover all excavated, steep-sided holes or trenches more than eight inches deep and that have sidewalls steeper than 1:1 (45 degree) slope with plywood or similar materials, or provide a minimum of one escape ramp per 100 feet of trenching (with slopes no greater than 3:1) constructed of earth fill or wooden planks. The applicant, or its contractors shall thoroughly inspect holes and trenches for trapped animals each workday.

f. Contractors shall not permit pets on the construction site.

g. If trash and debris need to be stored overnight during maintenance activities, fully covered trash receptacles that are animal-proof and weather-proof shall be used by the maintenance contractor to contain all food, food scraps, food wrappers, beverage containers, and other miscellaneous trash. Alternatively, standard trash receptacles may be used during the day but must be removed or emptied each night.

h. To prevent inadvertent disturbance to areas outside the limits of work, the construction limits shall be clearly demarcated (e.g., installation of flagging or temporary visibility construction fence) prior to ground-disturbance activities, and all construction activities, including equipment staging and maintenance, shall be conducted within the marked disturbance limits. The work limit delineation shall be maintained throughout Project

construction.

i. The Applicant, or its contractors, shall avoid the use of invasive plant species in the associated landscaping.

j. Prior to initial ground disturbing activities, a Worker Environmental Awareness Program (WEAP) shall be prepared, which will include a training presentation and key fact sheet. The training will instruct construction crews to be aware of and recognize sensitive biological resources that may be encountered within, or adjacent to, the Project. The training will provide workers with instructions to follow in the event a sensitive species is observed or suspected to be on site. Biologists shall provide WEAP training materials, including but not limited to the key fact sheet, to construction personnel before their commencement of work on the Project. Additionally, all construction staff shall attend the WEAP training presentation prior to beginning work on site. Upon completion of the WEAP training, each member of the construction crew shall sign a form stating that they attended the training, understood the information presented, and agreed to comply with the requirements set out in the WEAP training. Biologists shall provide updates relevant to the training to construction personnel during the safety ("tailgate") meetings, as needed.

MM BIO-3A Burrowing Owl Preconstruction Surveys. No less than 14 days prior to the onset of construction activities, a qualified biologist shall survey the construction limits of the project site and a 500-foot buffer for the presence of burrowing owls and occupied nest burrows. A second survey shall be conducted within 24 hours prior to the onset of construction activities. Time lapses between Project activities greater than one week (7 days) would trigger subsequent 24-hour take avoidance surveys to confirm burrowing owl absence. The surveys shall be conducted in accordance with the most current CDFW survey methods. If burrowing owls are not observed during clearance surveys or biological monitoring, no additional conditions are required to avoid impacts to burrowing owl.

The Project Applicant shall submit at least one burrowing owl pre-construction survey report to the satisfaction of the City to document compliance with this mitigation measure. For the purposes of this measure, "qualified biologist" is a biologist who meets the requirements set forth in the BUOW Guidelines (CDFW 2012).

MM BIO-3B Burrowing Owl Plan or CESA ITP. If burrowing owls, active burrows, or signs thereof are confirmed during any survey or biological monitoring, Project activities with the potential to impact burrowing owl shall be immediately halted. The qualified biologist shall coordinate with CDFW and prepare a Burrowing Owl Plan that shall be submitted to CDFW for review and approval prior to commencing on-site grading with the potential to impact burrowing owl. The Burrowing Owl Plan shall describe proposed avoidance, and monitoring actions. The Burrowing Owl Plan shall include the number and location of occupied burrow sites, acres of burrowing owl habitat that will be impacted, details of site monitoring, and details on proposed buffers and other avoidance measures if avoidance is proposed. Project activities with the potential to impact burrowing owl shall not occur within 500 feet of an active burrow until CDFW approves the Burrowing Owl Plan.

If Project activities, including occupied burrow exclusion and closure, could result in take of burrowing owl, the applicant shall coordinate with CDFW for appropriate CESA authorization (i.e., ITP under CFGC section 2081) prior to commencement of on-site grading with the potential

to impact burrowing owl. The ITP shall describe, at a minimum, Project activities and equipment, proposed avoidance/buffers, temporary and permanent impacts, monitoring, relocation and/or translocation, and minimization and compensatory mitigation actions. ITP compensatory mitigation will be fulfilled by one or more of following options: 1) purchase of credits at a CDFW-approved conservation or mitigation bank (if available); 2) execution of a Mitigation Credit Agreement; or 3) Permittee-responsible mitigation land acquisition.

The conditions of the permit or measures outlined in the plan shall be adhered to by the applicant and any required compensatory mitigation of habitat would be provided.

MM BIO-4A Crotch's Bumble Bee Surveys. At a minimum, two pre-construction nesting surveys shall be conducted prior to Project implementation. Surveys shall occur within 1) one week; and 2) within 24-hours prior to any vegetation removal or ground-disturbing activities scheduled to occur during the Crotch's bumble bee flight season (February through October). Surveys shall follow the guidelines provided in the CDFW's *Survey Considerations for CESA Candidate Bumble Bee Species* (2024b) and shall occur within the project site and areas adjacent to the project site where suitable habitat exists. The surveyors shall be qualified biologists familiar with Crotch's bumble bee identification and life history.

MM BIO-4B Crotch's Bumble Bee CESA ITP. Suitable Crotch's bumble bee habitat and Crotch's bumble bee presence has been confirmed on the site; therefore, a CESA ITP shall be applied for and obtained prior to the commencement of on-site grading with the potential to impact Crotch's bumble bee. The ITP shall include, at a minimum, a description of Project activities and equipment, proposed avoidance/buffers, identification of temporary and permanent impacts, monitoring requirements, relocation and/or translocation protocols, and compensatory mitigation measures. Compensatory mitigation will be at a minimum 1:1 ratio (acres conserved, enhanced, or restored to acres impacted). ITP compensatory mitigation shall be satisfied by one or more of the following mechanisms: 1) purchase of credits at a CDFW-approved conservation or mitigation bank (if available); 2) execution of a Mitigation Credit Agreement; or 3) Permittee-responsible mitigation land acquisition.

MM BIO-4C Crotch's Bumble Bee Biological Monitor. A qualified biological monitor shall conduct full-time monitoring during removal of suitable nectar plants that is scheduled to occur during the queen flight period (February through March), colony active period (April through August), and/or gyne flight period (September through October). The monitor shall have authority to temporarily halt or redirect activities as needed to avoid unauthorized impacts.

MM BIO-5A Nesting Bird Surveys. To ensure compliance with California Fish and Game Code Sections 3503, 3503.5, and 3513 and to avoid potential impacts to nesting birds, vegetation clearing and ground-disturbing activities shall be conducted outside of the bird nesting season (generally February 15 through August 31), if feasible. Regardless of the time of year, a qualified biologist shall conduct a nesting bird survey within three (3) days prior to any disturbance of the site, including but not limited to vegetation clearing, disking, demolition activities, staging, or grading.

MM BIO-5B Nesting Bird Surveys. If active nests are identified, the biologist shall establish suitable buffers around the nests depending on the level of activity within the buffer and species

observed. Buffer areas shall be avoided until the nests are no longer occupied, and the juvenile birds can survive independently from the nests. During construction activities, the qualified biologist shall continue biological monitoring activities at a frequency recommended by the qualified biologist using their best professional judgment. If nesting birds are documented, avoidance and minimization measures may be adjusted and construction activities stopped or redirected by the qualified biologist to avoid take of nesting birds.

If nesting birds are not documented during the pre-construction survey, adherence to additional measures may not be necessary to avoid impacts to nesting birds.

MM BIO-6A Special-Status Preconstruction Lizard Surveys. Within 30 days prior to the commencement of any on-site Project activities, a qualified biologist shall conduct pre-construction surveys in suitable special-status lizard habitat throughout the project site. Project-related activities that would result in ground disturbance include any construction, vegetation removal, and equipment and vehicle access, parking, and staging.

The qualified biologist shall have familiarity with special-status lizard species as recognized by CDFW. A minimum of one daytime survey during suitable weather for lizard activity shall be conducted by walking linear transects spaced to provide 100 percent coverage of suitable habitat. The location of any observed special-status lizards shall be documented. If feasible, the locations of any special-status lizards shall be avoided. Avoidance measures shall be monitored by the qualified biologist.

MM BIO-6B Special-Status Preconstruction Lizard Surveys. If pre-construction surveys are positive for coastal whiptail, coast horned lizard, or Southern California legless lizard and avoidance is not feasible, CDFW shall be notified in writing. In addition, relocation of all observed special-status lizard individuals shall be attempted and, if feasible, lizards would be relocated to the nearest available suitable habitat on conserved land in consultation with CDFW.

Facts in Support of the Finding:

Special-Status Plant Species

Parry's spineflower was not detected on the Project site during the general biological survey; however, this species was observed during focused rare plant surveys conducted within the species' typical blooming period (April – June) in 2025. Parry's spineflower was found within the chaparral vegetation community near the center of the Project site. Occurrences were primarily associated with open shallow basins consisting of lower growing perennial species such as California matchweed with larger chaparral species such as chamise and holly-leaved cherry (*Prunus Illicifolia*) on the margins. Approximately 1,200 individuals of Parry's spineflower were documented on site; please refer to Appendix D for the full survey results. Surveys were positive for Parry's spineflower; therefore, this species would be impacted with Project implementation. As set forth in MM BIO-1, compensatory mitigation would be required to conserve, enhance, or restore Parry's spineflower habitat at a minimum ratio of 1:1 and a rare plant mitigation plan would be developed and implemented. Therefore, with mitigation, the removal of Parry's spineflower on site would not result in a substantial adverse effect on the species. Additionally, the Project would

implement MM BIO-2, which would require the avoidance of invasive species in landscaping. This would ensure that competition from invasive species would not negatively impact the proliferation and survivorship of Parry's spineflower. Impacts to Parry's spineflower can be mitigated to a less than significant level. The proposed Project would not impact other special-status plants as no additional special-status species were observed and none have a moderate to high potential to occur within the Project site due to lack of suitable habitat. (**DEIR at 4.3-19**).

Threatened and Endangered Wildlife Species

Despite negative survey results, suitable habitat for burrowing owl (State candidate species for listing under the CESA) is present on site; therefore, this species may be impacted by Project implementation if present on site during construction. Crotch's bumble bee (State candidate for listing under the CESA) was observed on the Project site and may be impacted by Project implementation. The proposed Project will not impact any additional federally and/or state-listed wildlife species, as no additional listed species were observed during general biological surveys and none have moderate to high potential to occur on site based on lack of suitable habitat and the isolated nature of the site. These potential impacts are discussed in detail at **DEIR pages 4.3-19 to 4.3-21**.

To avoid direct impacts on burrowing owls, pre-construction clearance surveys, CDFW consultation, and best management practices as outlined in MM BIO-2, MM BIO-3A, and MM BIO-3B would be implemented. With implementation of the mitigation measures, direct impacts on burrowing owls, if present, would be reduced to less than significant. Additionally, a potentially significant impact could occur if burrowing owl is present adjacent to the Project site during nighttime construction that involves the use of lighting. Such impacts are potentially significant because lights could reduce burrowing owls' hunting success and make burrowing owls easier targets for predators. To avoid potential impacts on burrowing owl from nighttime construction and lighting, construction would occur during the day as outlined specifically in MM BIO-2(c).

Further, a potentially significant impact could occur if burrowing owl is present in the suitable habitat west of the Project site due to elevated noise, vibration, and dust levels generated by construction equipment. However, these disturbances are temporary and relatively short in duration, thus unlikely to affect burrowing owl behavior. In addition, as outlined in MM BIO-3A and MM BIO-3B, burrowing owl pre-construction surveys would include a 500-foot buffer around the Project site; therefore, burrowing owls occurring near to the site would be detected, if present. If burrowing owls are detected within 500 feet of the Project site, CDFW would be consulted for additional guidance. As such, impacts during Project construction are anticipated to be less than significant. Therefore, with adherence to MM BIO-1, MM BIO-3A, and MM BIO-3B, potential impacts to burrowing owl would be reduced to less than significant.

Prior to initial ground disturbing activities, as required by MM BIO-1(j), construction personnel would be provided training with instructions to follow in the event a Crotch's bumble bee nest is observed or suspected to be on site. In accordance with MM BIO-4A, pre-construction surveys would be conducted to locate any active Crotch's bumble bee nests within or adjacent to construction areas, if nests are detected, as required under MM BIO-4B. Avoidance and minimization measures as outlined in project-specific permits (i.e., CESA ITP) would be followed

to ensure unauthorized take does not occur. In addition to nests, impacts could occur to Crotch's bumble bee if a bee enters the Project site during active construction. In compliance with MM BIO-4C, a biological monitor would be present on site during removal of suitable nectar sources and if an individual is identified, would stop construction work to allow Crotch's bumble bee to move out of harm's way. MM BIO-1 would also require compliance with construction BMPs to further avoid or minimize the potential for direct adverse impacts to Crotch's bumble bee during construction activities.

Project implementation could still result in a potentially significant impact on Crotch's bumble bee through destruction or degradation of suitable habitat, including nectar sources and potential nest burrows located on the Project site. As set forth in MM BIO-4B, however, ITP compensatory mitigation shall be provided by one or more of the following mechanisms: 1) purchase of credits at a CDFW-approved conservation or mitigation bank (if available); 2) execution of a Mitigation Credit Agreement; or 3) Permittee-responsible mitigation land acquisition. Therefore, with mitigation, the removal of Crotch's bumble bee habitat on-site would not result in a substantial adverse effect on the species.

Indirect impacts on Crotch's bumble bee, if present adjacent to the Project site, could occur during construction due to elevated noise, vibration, and dust levels generated by equipment. These disturbances are temporary and relatively short in duration and are unlikely to affect Crotch's bumble bee behavior. As such, indirect impacts during Project construction are anticipated to be less than significant in this regard. Adherence with the mitigation measures listed above would ensure impacts to Crotch's bumble bee would be less than significant. It should be noted, if Crotch's bumble bee is no longer a candidate or listed species under CESA at the time of Project construction, then these mitigation measures would not be required. (**DEIR at 4.3-19 to 4.3-21**).

Special-Status Wildlife Species

As identified in **DEIR Table 4.3-1**, it was determined that six additional non-listed special-status wildlife species have a moderate to low-to-moderate potential to occur on the Project site: California horned lark, loggerhead shrike, prairie falcon, merlin, coast horned lizard, and Southern California legless lizard. Additionally, four non-listed special-status species were observed on-site; Cooper's hawk, coastal whiptail, Costa's hummingbird, and Lawrence's goldfinch. None of the special-status wildlife species identified above are federally or State listed as endangered or threatened. The Project's potential to impact species or indirectly impact foraging and movement behavior of species is discussed in detail at **DEIR pages 4.3-21 to 4.3-23**.

Suitable foraging habitat for Costa's hummingbird, Lawrence's goldfinch, California horned lark and loggerhead shrike is present within proximity to the Project site and is abundant throughout the region. In addition, as required by MM BIO-4B, compensatory habitat mitigation lands for Crotch's bumble bee are likely to also be suitable for these four non-listed avian species. As such, removal of suitable foraging habitat would be less than significant. However, Project construction activities could result in potentially significant impacts on nesting Costa's hummingbird, Lawrence's goldfinch, California horned lark and loggerhead shrike, if nests are present. Vegetation trimming or removal of suitable habitat within an active breeding territory could result in harassment, injury, damage or destruction of an active nest, and/or death of adults, eggs, and/or

young during construction activities. The Project would implement MM BIO-2, which would require best management practices including flushing species from the site prior to vegetation removal. Additionally, MM BIO-5A and MM BIO-5B would require compliance with California Fish and Game Code Sections 3503, 3503.5, and 3513, avoidance of nesting season if feasible, nesting bird surveys 3 days prior to site disturbance, and buffers to be established around active nests.

Indirect impacts on Costa's hummingbird, Lawrence's goldfinch, California horned lark, and loggerhead shrike, if present adjacent to the Project site, could occur during construction due to elevated noise, vibration, and dust levels generated by equipment. These disturbances are temporary and relatively short in duration and are unlikely to affect Costa's hummingbird, Lawrence's goldfinch, California horned lark, or loggerhead shrike behavior. As such, indirect impacts during Project construction are anticipated to be less than significant. Overall, with implementation of MM BIO-2, MM BIO-4B, MM BIO-5A, and MM BIO-5B, impacts to Costa's hummingbird, Lawrence's goldfinch, California Horned Lark and Loggerhead Shrike would be less than significant. Cooper's hawk, prairie falcon and merlin are not anticipated to nest on or immediately adjacent to the Project site and impacts on Cooper's hawk, prairie falcon, and merlin would be less than significant. Suitable nesting habitat is not present for any of these raptor species. Prairie falcon primarily nests on ledges and cliffs which are absent from the project site, and merlin is not known to nest in Southern California. The project site also lacks woodlands appropriate for Cooper's hawk nesting. (**DEIR at 4.3-22**).

Vegetation clearing and grading and other construction activities could result in harassment, injury, and/or death of coastal whiptail, coast horned lizard and Southern California legless lizard. Therefore, Project construction activities could result in a potentially significant impact on these special-status species, if present on site. As set forth in MM BIO-2 construction best management practices would be implemented. As outlined in MM BIO-6A and MM BIO-6B, pre-construction surveys for the special-status lizard species would be required, if identified and avoidance is not feasible, species would be relocated. Therefore, Project implementation would not result in potential direct harassment, injury, and/or mortality of coastal whiptail, coast horned lizard, and Southern California legless lizard and impacts would be less than significant with MM BIO-2, BIO-6A, and MM BIO-6B. (**DEIR at 4.3-23**).

Potential Significant Impact (Threshold 4.3-4): The EIR evaluated and concluded that the Project could interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.

Finding: Based on the entire record, the City Council finds that this impact is potentially significant, but can be mitigated to a less than significant level through implementation of Mitigation Measure BIO-5, as provided above. The Mitigation Measures are adopted and incorporated into the MMRP for the Project, and will be implemented as specified therein, thereby reducing this potentially significant impact to a less than significant level. The impacts related to this issue area are discussed in detail in Section 4.3 of the DEIR. The following Mitigation Measures will mitigate Project-specific and cumulative impacts related to the movement of

native resident or migratory fish or wildlife species or established native resident or migratory wildlife corridors, or native wildlife nursery sites.

Mitigation Measures

Implement MM BIO-5.

Facts in Support of the Finding: The Project site does not function as part of a wildlife corridor. However, important connectivity corridors occur less than one mile north of the Project site in association with Lytle Creek Wash, which is identified in the Rialto General Plan as unique and valuable habitat. Due to the site's proximity to an important connectivity area, the Project area could potentially be used by wildlife as a refuge between larger areas of naturally occurring habitat. However, the Project site does not contain large areas of contiguous native vegetation and is surrounded by development. Therefore, only species capable of flight would be able to use the site as a stepping stone between habitats. Implementation of the Project would preclude the use of the site as a stepping-stone refuge. However, other nearby green spaces, such as Alec Fergusson Park, Sierra Lakes, and Roger Birdsall Park, provide suitable refugia for flight-capable species. As such, Project implementation would not substantially interfere with wildlife movement opportunities or a wildlife corridor, and impacts would be less than significant.

The Project has the potential to impact nesting migratory birds that have acclimated to urban life and nest and forage in the local trees and shrubs. The Project site contains habitat with the potential to support avian nests and impacts on nesting birds. The proposed Project has the potential to impact active bird nests if vegetation is removed or ground disturbing activities are initiated during the nesting season. The direct injury or death of a migratory bird due to construction or other disturbance that causes nest abandonment, nestling abandonment, or forced fledging would be considered a significant impact as impacts on nesting birds are prohibited by the MBTA and/or California Fish and Game Code Section 3503. The Project would implement MM BIO-5A, which would require compliance with California Fish and Game Code Sections 3503, 3503.5, and 3513, avoidance of nesting season if feasible, and nesting bird surveys three days prior to site disturbance, and MM BIO-5B, which would require buffers to be established around active nests. Adherence to MM BIO-5A and MM BIO-5B would ensure Project implementation would result in a less than significant impact to migratory birds. Therefore, the Project would not interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impede the use of native wildlife nursery sites. (**DEIR at 4.3-23 to 4.3-24**).

Potential Significant Impact (Threshold 4.3-5): The EIR evaluated and concluded that the Project could conflict with local policies or ordinances protecting biological resources.

Finding: Based on the entire record, the City Council finds that this impact is potentially significant but can be mitigated to a less than significant level through implementation of Mitigation Measure BIO-3A, as discussed below. The Mitigation Measure is adopted and incorporated into the MMRP for the Project, and will be implemented as specified therein, thereby reducing this potentially significant impact to a less than significant level. The impacts related to this issue

area are discussed in detail in Section 4.3 of the DEIR. The following Mitigation Measure will mitigate Project-specific and cumulative impacts relative to this issue area:

Mitigation Measures

Implement MM BIO-3A.

Facts in Support of the Finding: The Project site is within the Burrowing Owl Overlay Zone identified on the San Bernardino County Biotic Resources Map. However, the Project site has been subject to a variety of human disturbances and is bordered by industrial development. These disturbances have heavily impacted the natural plant communities, which reduces potential foraging and nesting/denning opportunities for wildlife species. Pursuant to San Bernardino County requirements, focused surveys and pre-construction surveys for burrowing owl are necessary to determine presence/absence within the Project site. Focused surveys have been conducted, and no burrowing owl individuals or active signs were observed during the general biological survey on October 29, 2024, nor during focused surveys between October 29, 2024, and January 31, 2025. Despite negative survey results, burrowing owl could forage, seek refuge, and/or breed on site in the future due to the presence of suitable habitat and burrows throughout the Project site. As set forth in MM BIO-3A, pre-construction clearance surveys for burrowing owls would be conducted in accordance with CDFW's Staff Report on Burrowing Owl Mitigation. As such, the Project would not conflict with the County of San Bernardino Biotic Resources Overlay Zones.

Rialto General Plan Policy 2-39.3 outlines continued support for the Delhi Sands Flower-loving Fly. It was determined the Project site does not contain suitable soils for Delhi Sands flower-loving fly. As such, protocol surveys are not required, and the Rialto General Plan policy related to this species is not applicable. Therefore, the Project would not conflict with any local policies or ordinances protecting biological resources. (**DEIR at 4.3-25**).

Cumulative Impacts

Past, present and reasonably foreseeable future projects are required to implement measures, as set forth in their respective CEQA documents, consistent with federal, State, and local regulations to avoid adverse effects to existing biological resources or to mitigate for significant impacts to these resources. The types of measures required for projects impacting protected habitat, species, and regulated resources can include avoidance, project design features, regulatory approvals, best management practices, and mitigation measures. With implementation of MM BIO-1 through MM BIO-6, the proposed Project would not cause a significant impact to biological resources. Mitigation would include construction BMPs to avoid potential impacts and disturbance to special status species, and Parry's spineflower, burrowing owl, nesting bird, Crotch's bumble bee, Coastal whiptail, Coast horned lizard, and Southern California legless lizard pre-construction surveys and avoidance measures. Project level impacts would be less than significant with the implementation of these measures and therefore would not contribute to a cumulative impact. Additionally, as discussed in this section, the Project site does not contain riparian habitat or any other water resources.

The Project site does not contain waters, including wetland waters, that are subject to federal jurisdiction under Section 404 of the CWA. The Project site is not located within a designated protected area, which may support species and habitats that are sensitive and rare within the region or may function as a migration corridor for wildlife. Lastly, the Project would not conflict with any local policies or ordinances protecting biological resources. Therefore, with the implementation of MM BIO-1 through MM BIO-6, the Project would not contribute to a cumulative effect on biological resources including sensitive species, protected habitat, or wetland resources. Therefore, the Project would not contribute to a cumulatively considerable impact. (**DEIR at 4.3-25 to 4.3-26**).

5.2.3 Cultural Resources

Potential Significant Impact (Threshold 4.4-1): The EIR evaluated and concluded that the Project could cause a substantial adverse change in the significance of an historical resource pursuant to Section 15064.5.

Findings: Potential impacts of the Project on cultural resources are discussed in Section 4.4 of the DEIR. Based on the entire record, the City Council finds there is the potential for impacts to historical resources and that this impact is potentially significant, but can be mitigated to a less than significant level through implementation of Mitigation Measures CUL-1 to CUL-5. These Mitigation Measures are adopted and incorporated into the MMRP for the Project, and will be implemented as specified therein, thereby reducing this potentially significant impact to a less than significant level. The following Mitigation Measures will mitigate Project-level and cumulative impacts related to historical resources to below a level of significance:

Mitigation Measures

MM CUL-1: **Retention of Archaeologist**. Prior to issuance of any permit for ground-disturbing activities, the Project Applicant shall provide evidence to the City of Rialto (City) that a qualified professional archaeologist meeting Secretary of the Interior professional qualifications (Project Archaeologist) has been retained.

MM CUL-2: **Cultural Resources Management Plan**. Prior to any ground-disturbing activities the Project Archaeologist shall develop a Cultural Resource Management Plan (CRMP) to address the details, timing, and responsibilities of all archaeological and cultural resource activities that occur on the Project site. The CRMP shall be written in consultation with the Consulting Tribes and shall include the following: approved Mitigation Measures (MM)/ Conditions of Approval (COA), contact information for all pertinent parties, parties' responsibilities, procedures for each MM or COA, and an overview of the Project schedule.

MM CUL-3: **Cultural Resources Sensitivity Training**. A Cultural Resources Training shall be provided to all construction managers and construction personnel prior to commencing any ground disturbance work within the Project area. The training shall be prepared and conducted or overseen by the Project Archaeologist. The training content shall include, but is not limited to, information about any known cultural resources in Project area and vicinity and the process for inadvertent

discovery. The training may be discontinued when ground disturbance is completed. Construction personnel shall not be permitted to operate equipment within the construction area unless they have attended the training. The Qualified Archeologist or designated Archaeological Monitor and Monitoring Tribes' designated representatives shall attend the pre-grade meeting with the grading contractors to conduct the initial training and explain and coordinate the requirements of the Cultural Resource Management Plan.

MM CUL-4: **Archaeological Monitoring**. The Project Archaeologist shall monitor or supervise archaeological monitors (Monitors) for initial ground disturbing activities. After initial grading, should no cultural resources be present and/or subsurface soils indicate a low likelihood for significant intact resources, the Project Archaeologist shall have the ability to recommend archaeological monitoring be decreased or eliminated after initial ground-disturbing activities are complete, which shall be approved in writing by the City. Any such recommendation shall be specific to archaeological monitoring and not impact the implementation of Mitigation Measures TCR-1 and/or TCR-2.

MM CUL-5: **Inadvertent Discovery of Cultural Resources**. In the event that cultural resources are discovered during Project implementation, all earthwork and ground-disturbing activities shall halt within a buffer of the discovery established by the Project Archaeologist and the Project Archaeologist shall assess the nature and significance of the find. The Project Archaeologist shall coordinate with the City and identify whether the resource is potentially significant and if it requires further evaluation. Work on the other portions of the Project site outside of the buffered area may continue during this assessment period. If the cultural resources are Native American in origin, the Consulting Tribes must be immediately contacted and consulted regarding potential significance and treatment of the resource. Specifically, the Consulting Tribes shall be contacted, as detailed within Tribal Cultural Resources (TCR) Mitigation Measure 3, regarding any pre-contact finds and shall be provided information after the Project Archaeologist makes his/her initial assessment of the nature of the find, so as to provide Tribal input with regard to significance and treatment. For any potential significant cultural resources, the Project Archaeologist shall make recommendations to the City to avoid or mitigate impacts to the resource. If significant pre-contact cultural resources, as defined by CEQA, are discovered and avoidance cannot be ensured, the archaeologist shall develop a Monitoring and Treatment Plan, the drafts of which shall be provided to the Consulting Tribes for review and comment, as detailed within TCR-1. The Project Archaeologist shall monitor the remainder of the Project and implement the Monitoring and Treatment Plan accordingly. Preservation in place (i.e. avoidance) is the preferred manner of treatment. If preservation in place is not feasible, treatment may include implementation of archaeological data recovery to excavate the resource along with subsequent laboratory processing and analysis.

Disposition of significant Native American archaeological materials, such as reburial or curation by a qualified repository within San Bernardino County, shall be agreed upon by the City and Consulting Tribes. Any significant non-Native American archaeological material shall be curated at a public, non-profit institution with a research interest in the materials within San Bernardino County, if such an institution agrees to accept the material. If no institution accepts the archaeological material, it shall be offered to a local school or historical society in the area for educational purposes. All identified cultural resources shall be recorded on appropriate California

Department of Parks and Recreation (CA DPR 523) series forms and evaluated for significance. All findings shall be included within a Monitoring Report drafted by the Project Archaeologist and submitted to the City and Consulting Tribes for review. Final copies of the Monitoring Report shall be submitted to the City, Consulting Tribes, and South Central Coastal Information Center (SCCIC).

Facts in Support of the Finding: The results of the record search at the South Central Coastal Information Center indicated that three cultural resources have been previously recorded within the Project area, with one historic age resource, CA-SBR-8696H (the Rialto Military Munitions Bunker Complex), partially located within the southwestern portion of the Project site. The record search results also identified 12 cultural resource studies that had been completed within the search area, four of which include a portion of the Project site. Three of the studies overlap with the Project site and focus on cultural resource CA-SBR-8696H; no other resources were identified. The fourth study was conducted in 2007 and analyzed the same area as the Project site. Again, the only resource identified was CA-SBR-8969H.

Resource CA-SBR-8696H is a historic-age resource originally recorded in 1996 and encompasses 2,822 acres including a World War II-era complex with 20 earth-covered bunkers, one of which is located within the boundaries of the Project site and was given the resource name Rialto Military Munitions Bunker Complex. Upon review of previous reports and site records, it was noted that different portions of the historic site were re-visited in 1997, 1998, 2006, and 2010, with the 1998 visitation resulting in a large-scale evaluation effort for the entirety of the site (**DEIR, Appendix E**). As a result of the 1998 evaluation, CA-SBR-8969H was not recommended eligible for listing in the National Register of Historic Places (NRHP) under any criteria. During the 2006 site visit, it was noted that much of the site had been destroyed by development and it was recommended that the site was not eligible for listing in the NRHP or the California Register of Historical Resources (CRHR). The site visit in 2010 noted additional destruction to the historic site and overall lack of integrity. None of the previous cultural resource studies conducted found resource CA-SBR-8969H eligible for listing in the NRHP or the CRHR.

The intensive-level pedestrian survey conducted of the Project site on April 9, 2024 for the DEIR, found the entire site highly disturbed due to prior grading and development with various instances of modern dumping and squatting observed (**DEIR at 4.4-7**). The field survey also confirmed the presence of resource CA-SBR-8696H at the Project site and noted the collapsing entry structure to the bunker and historic debris. As such, Kimley-Horn cultural staff concurred with the prior recommendations that CA-SBR-8696H is not eligible for listing in the NRHP or CRHR and further noted that the site does not meet the definition of a "Historical Resource" or "Unique Archaeological Resource" under CEQA. No new or other resources were identified at the Project site as a result of the survey.

In addition to the walkover survey, research within the National Register, California Register, National Historic Landmarks list, and other cultural databases revealed no other cultural resources. Historical aerial imagery was also reviewed for the presence of a potential resource. The imagery revealed development associated with the Rialto Military Munitions Bunker Complex and grading activities occurring in the northern and southern portions of the Project site from the 1980s through the 2000s. No other potential cultural resources were revealed.

Although the Project site was noted as highly disturbed due to prior grading and development, and no known NRHP or CRHR eligible historical resources were identified, there is the potential for Project implementation to unearth and impact unknown, subsurface cultural resources. Therefore, Mitigation Measure (MM) CUL-1 requires the retention of an archaeologist, MM CUL-2 requires the preparation of a Cultural Resource Management Plan for the Project, MM CUL-3 requires cultural sensitivity training, MM CUL-4 requires archaeological monitoring, and MM CUL-5 outlines appropriate protocol and treatment in the event a cultural resource is discovered. MM CUL-1 through MM CUL-5 would ensure that if an unknown cultural resource is unearthed during Project construction it would not result in a substantial adverse change in the significance of the resource. Therefore, potential impacts to historical resources pursuant to Section 15064.5 would be reduced to a less than significant level with mitigation. (**DEIR at 4.4-7 to 4.4-8**).

Potential Significant Impact (Threshold 4.4-2): The EIR evaluated and concluded that the Project could cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA Guidelines Section 15064.5.

Finding: Based on the entire record, the City Council finds that this impact is potentially significant but can be mitigated to a less than significant level through implementation of Mitigation Measures CUL-1 to CUL-5. These Mitigation Measures are adopted and incorporated into the MMRP for the Project, and will be implemented as specified therein, thereby reducing this potentially significant impact to a less than significant level. In addition, the City's Standard Condition SC CUL-1 is applicable to the Project. The impacts related to this issue area are discussed in detail in Section 4.4 of the DEIR. The following Mitigation Measures will mitigate Project-level and cumulative impacts related to archaeological resources to below a level of significance:

Mitigation Measure

CUL-1 to CUL-5 are applicable, as provided above.

Facts in Support of the Finding: As noted above, one cultural resource, the World War II-era complex CA-SBR-8696H, was identified as partially located within the southwestern portion of the Project site. In concurrence with prior recommendations, CA-SBR-8696H was found not eligible for listing in the NRHP or CRHR, and the site does not meet the definition of a "Historical Resource" or "Unique Archaeological Resource" under CEQA.

As discussed above, the April 9, 2024, intensive-level pedestrian survey conducted for the Project site found the entire site highly disturbed due to prior grading and development. The field survey confirmed the presence of CA-SBR-8696H at the Project site and noted the collapsing entry structure to the bunker and historic debris. No new or other cultural resources (including other architectural historical resources, prehistoric archaeological resources, or historic archaeological resources) were identified on the Project site as a result of the survey. Further, the extent of prior disturbance indicates there is low potential for intact buried cultural resources at the Project site.

Although low, there is the potential for Project implementation to unearth and impact an unknown, subsurface archaeological resource that could be determined a "Unique Archaeological Resource." Despite the low likelihood of discovery, if a "Unique Archaeological Resource" is discovered during the Project's ground-disturbing activities, a substantial adverse change in the significance of such a resource could occur. The Project would comply with MM CUL-1 through MM CUL-5, which would ensure the discovery of unrecorded cultural resources during construction activities would not result in potential impacts to archaeological resources pursuant to Section 15064.5 and impacts would be less than significant. (**DEIR at 4.4-8**).

Cumulative Impacts

For purposes of cumulative impact analysis to cultural resources, the geographic context for cumulative analysis of the Project is regional and considers both direct and indirect impacts over a wide area. This geographic scope of analysis is appropriate because the archaeological and historical resources within this area are expected to be similar to those that occur on the Project site due to their similar environment, geology, and hydrology. This discussion is focused on the Project's potential for resulting in site-specific impacts that could contribute to a cumulative loss. However, cultural resources impacts are site-specific and not generally subject to cumulative impacts unless multiple projects impact a common resource, or a significant affected resource extends off the site, such as a historic townsite or district. With this consideration, the cumulative analyses for historical and archaeological resources considers whether the Project, in combination with the past, present, and reasonably foreseeable projects, could cumulatively affect any common cultural resources.

The Project could result in potential site-specific impacts to unknown cultural resources discovered during Project construction, especially ground-disturbing activities. However, implementation of MM CUL-1 through MM CUL-5 would reduce the Project's incremental potential impacts to historical and archaeological resources to less than significant and ensure site-specific impacts to cultural resources would not be cumulatively considerable. Other projects within the cumulative study area also have the potential to result in damage and/or loss to unknown cultural resources. Similar to the proposed Project, past, present, and reasonably foreseeable projects in the City would be required to comply with all applicable State, federal, and local regulations concerning preservation, salvage, or handling of cultural resources. Therefore, the Project's contribution to cumulative impacts would be less than significant. Project construction has the potential to disturb unknown human remains.

Compliance with Health and Safety Code Section 7050.5 and Public Resources Code Section 5097.98, as outlined in SC CUL-1, would require proper treatment in accordance with applicable laws for human remains and reduce potential site-specific impacts to less than significant. Similar to the proposed Project, past, present, and reasonably foreseeable projects in the City would also be required to comply with Health and Safety Code Section 7050.5 and Public Resources Code Section 5097.98 which would reduce potential adverse impacts to human remains in the cumulative study area. Therefore, the Project's incremental effect is not cumulatively considerable when viewed in connection with the effects of other closely related past projects, the effects of other current projects, and the effects of probable future projects. Thus, cumulative impacts to cultural resources would be less than significant. (**DEIR at 4.4-9 to 4.4-10**).

5.2.4 Geology and Soils

Potential Significant Impact (Threshold 4.6-6): The EIR evaluated and concluded that the Project could directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.

Finding: Based on the entire record, the City Council finds that this impact is potentially significant but can be mitigated to a less than significant level through implementation of Mitigation Measure GEO-1. This Mitigation Measure is adopted and incorporated into the MMRP for the Project, and will be implemented as specified therein, thereby reducing this potentially significant impact to a less than significant level. In addition, the City's Standard Condition SC GEO-1 is applicable to the Project. The impacts related to this issue area are discussed in detail in Section 4.6 of the DEIR. The following Mitigation Measure will mitigate Project level and cumulative impacts related to inadvertent destruction of a unique paleontological resource or site or unique geologic feature to below a level of significance:

Mitigation Measure

MM GEO-1 Paleontological Monitoring. Prior to the issuance of any grading permits, or any permit authorizing ground disturbance, the Project Applicant shall, to the satisfaction of the City of Rialto Community Development Director, demonstrate that a qualified paleontologist has been retained to respond on an as-needed basis to address unanticipated paleontological discoveries. A paleontologist is defined as an individual with an M.S./M.A. or Ph.D. in paleontology or geology who is familiar with paleontological procedures and techniques, and who is knowledgeable in the geology and paleontology of the area.

In the event that fossils or fossil-bearing deposits are inadvertently unearthed during excavation and grading activities, all earth disturbing activities within a 100-foot radius of the area of discovery shall be temporarily halted or diverted. The qualified paleontologist shall be contacted to evaluate the significance of the finding and determine an appropriate course of action in accordance with Society of Vertebrate Paleontology standards and assess the significance of the find under the criteria set forth in CEQA Guidelines Section 15064.5. The paleontologist shall notify the appropriate agencies to determine procedures that would be followed before construction is allowed to resume at the location of the find. If in consultation with the paleontologist, City staff and the Project Applicant determine that avoidance is not feasible, the paleontologist shall prepare an excavation plan for reducing the effect of the Project on the qualities that make the resource important. The plan shall be submitted to the City for review and approval and the Project Applicant shall implement the approval plan.

Facts in Support of the Finding: The Project site's geologic setting is described in detail at **DEIR page 4.6-5 to 4.6-9**. A paleontological records search conducted by Western Science Center was prepared for the Project on May 13, 2024, which indicates that no known fossil localities have been recorded at the Project site (**DEIR, Appendix F3**). The Project site contains surface artificial

fill underlain by Holocene-aged younger alluvium. These Holocene alluvial deposits are considered too young to potentially yield paleontological resources. Therefore, the Project site's underlying soils have low paleontological sensitivity. As such, it is considered unlikely that unknown paleontological resources would be unearthed during Project implementation. However, if development requires any substantial depth of disturbance, the likelihood of reaching Pleistocene alluvial sediments would increase. (**DEIR at 4.6-13**).

In the event previously unknown paleontological resources are unearthed during Project construction, significant impacts could occur. MM GEO-1 requires the retention of a qualified paleontologist to monitor the site on an as-needed basis. With the implementation of MM GEO-1, potential impacts to paleontological resources would be reduced to a less than significant level.

Cumulative impacts related to paleontological resources are typically site-specific. The analysis herein determined that the proposed Project could result in potentially significant impacts related to the destruction of a previously unknown unique paleontological resource given that the Project site may contain soils conducive for such resources. MM GEO-1 would address this potential as it requires the retention of a qualified paleontologist for monitoring and therefore would reduce impacts to less than significant. Therefore, the Project would not result in incremental effects to paleontology that could be compounded or increased when considered together with similar effects from other past, present, and reasonably foreseeable probable future projects. Therefore, with inclusion of MM GEO-1, the Project would not result in a cumulatively considerable impact. (**DEIR at 4.6-14 to 4.6-15**).

5.2.5 Greenhouse Gas Emissions

Potential significant impact (Threshold 4.7-2): The EIR evaluated and concluded that the Project could conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases (GHGs).

Finding: Based on the entire record, the City Council finds that this impact is potentially significant but can be mitigated to a less than significant level through implementation of Mitigation Measures AQ-2 through AQ-5 and GHG-1 through GHG-4. These Mitigation Measures are adopted and incorporated into the MMRP for the Project and will be implemented as specified therein, thereby reducing this potentially significant impact to a less than significant level. In addition, LORs GHG-1 to GHG-7 are applicable to the Project. The impacts related to this issue area are discussed in detail in Section 4.7 of the DEIR. The following Mitigation Measures will mitigate impacts related to conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases to below a level of significance:

Mitigation Measure

Implement MM AQ-2 to AQ-5 and:

MM GHG-1 On-Site Renewable Electricity Generation. Prior to the issuance of the final Certificate of Occupancy for the building tenant, documentation shall be provided to the City demonstrating that the Project has either: 1) installed solar photovoltaic (PV) panels or other source of renewable energy generation on the site, or 2) otherwise acquired energy from the local utility that has been generated by renewable sources, such that either option will provide 100 percent of the expected building load which is anticipated to be approximately 1.42 kilowatt hours per year [kWh/year] per square foot). Alternatively, the Project may achieve 100 percent of the building's expected energy load through a combination of on-site renewable energy generation and renewable energy purchase.

The final PV generation facility size requires approval by Southern California Edison (SCE). Should SCE limit the facility size, the amounts above shall be limited to the amount of SCE's approval. This mitigation measure applies only to tenant improvements and not the building shell approvals.

MM GHG-2 CALGreen Tier 2. Prior to the issuance of a building permit, the Project Applicant or successor in interest shall provide documentation to the City of Rialto Community Development Department, Building and Safety Division demonstrating that the Project is designed to meet or exceed 2022 CALGreen Tier 2 standards in effect at the time of building permit application.

MM GHG-3 Solid Waste Diversion. Prior to issuance of tenant occupancy permits, the Project operator shall designate a solid waste management coordinator and implement a waste management plan to recycle and/or salvage nonhazardous debris to achieve a minimum 75 percent diversion from landfills. The City of Rialto Community Development Department, Planning Division shall confirm that sales or lease agreements includes contractual language that obligates tenants, operators, or future owners to comply with the solid waste management plan. This mitigation measure applies only to tenant permits and not the building shell approvals.

MM GHG-4 Water Use Efficiency and Conservation Plan. The Project Applicant or designee shall implement a Water Use Efficiency and Conservation Plan that includes the following minimum requirements:

Indoor Conservation Features and Operations:

- Install low-flow Fixtures: Install low-flow toilets at 1.28 gallons per flush, faucets at 1.2 gallons per minute, showerheads at 1.8 gallons per minute, kitchen faucets at 1.8 gallons per minute. In common areas, install faucets at 0.5 gallon per minute and urinals at max of 0.25 gallon per minute/flush. (These fixtures use less water while maintaining efficient performance.)
- Install dual-flush toilets: These toilets offer two flush options: one for liquid waste less than 1 gallon per minute and another for solid waste at 1.28 gallons per minute. (This allows the appropriate use of water for flushing needs.)
- Use water-efficient appliances: The Project Applicant or designee shall install energy-efficient and water-saving appliances with the ENERGY STAR label only.

- Good housekeeping and regular maintenance: The Project Applicant or designee shall regularly check and maintain plumbing fixtures, irrigation systems, and appliances to ensure they are functioning efficiently and not wasting water.

Outdoor Conservation Features and Operations:

- Install only "Smart Irrigation Systems" for community landscaping: The Project Applicant or designee shall use smart sprinkler systems that adjust watering schedules based on weather conditions, soil moisture, and plant needs to avoid over or wasteful watering. The Project Applicant or designee shall also incorporate seasonal specific controls to ensure watering occurs during the most efficient times of day.
- Adjustable Water Pressure Regulator: The Project Applicant or designee shall install pressure regulators to maintain optimal water pressure, preventing overuse and leaks.
- Drought-tolerant landscaping: The Project Applicant or designee shall include native and drought-tolerant vegetation that requires less water to thrive and is known to survive in the City of Rialto. The Project Applicant or designee shall replace drought-tolerant landscaping if it dies through enforceable Project CC&Rs and/or tenant lease agreements.

Facts in Support of the Finding:

City of Rialto Climate Adaptation Plan Consistency

The Rialto Climate Adaptation Plan outlines goals to reduce energy consumption and GHG emissions to become a more sustainable community. The proposed Project would be required to comply with all building codes in effect at the time of construction, which include energy conservation measures mandated by Title 24 of the California Building Standards Code – Energy Efficiency Standards and the California Green Building Standards. Because Title 24 standards require energy conservation features in new construction (e.g., high-efficiency lighting, high-efficiency heating, ventilating, and air-conditioning [HVAC] systems, thermal insulation, double-glazed windows, water-conserving plumbing fixtures), these standards indirectly regulate and reduce GHG emissions. California's Building Energy Efficiency Standards are updated on an approximately three-year cycle. The most recent 2022 standards went into effect January 1, 2023. Further, the Project would comply with the Rialto General Plan policies and State Building Code provisions designed to reduce GHG emissions. The proposed Project would also comply with all SCAQMD applicable rules and regulations during construction and operation and would not interfere with the State's AB 32 goals. (**DEIR at 4.7-21**)

Consistency with SCAG RTP/SCS (Connect SoCal)

On April 4, 2024, SCAG's Regional Council adopted the 2024 - 2050 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) or Connect SoCal. The RTP/SCS is a long-range visioning plan that balances future mobility and housing needs with economic, environmental, and public health goals. The RTP/SCS embodies a collective vision for the region's future and is developed with input from local governments, county transportation commissions, tribal governments, nonprofit organizations, businesses, and local stakeholders in the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. Under SB 375, SCAG's

RTP/SCS establishes GHG emissions goals to reduce GHG emissions in the region by eight percent from 2005 levels by 2020 and 19 percent by 2035.17

Implementation of the RTP/SCS would add 181,200 new miles of transit revenue service, 4,000 new miles of bike lanes and 869 new miles to the Regional Express Lane Network. Strategic investments in infrastructure and transportation would improve access to employment centers and stimulate regional economic growth and opportunity in historically underserved areas. Connect SoCal is an important planning document for the region, allowing public agencies to implement transportation projects in a coordinated manner while qualifying for federal and State funding. Connect SoCal also supports local jurisdictions in making informed land use planning and housing development decisions.

The RTP/SCS plans account for operations and maintenance costs to ensure reliability, longevity, and cost effectiveness. The RTP/SCS are also supported by a combination of transportation and land use strategies that help the region achieve State GHG emissions reduction goals and FCAA requirements, increased housing production, improved equity and resilience, the preservation of natural lands, improvement of public health, increased transportation safety, support for the region's vital goods movement industries and more efficient use of resources. GHG emissions resulting from development-related mobile sources are the most potent source of emissions, and therefore Project comparison to the RTP/SCS is an appropriate indicator of whether the Project would inhibit the post-2020 GHG reduction goals promulgated by the State. The Project's consistency with the Connect SoCal goals is provided in **DEIR Table 4.7-4: Connect SoCal Consistency**.

Compliance with applicable State standards would ensure consistency with State and regional GHG reduction planning efforts. The goals stated in the RTP/SCS were used to determine consistency with the planning efforts previously stated. As shown in **DEIR Table 4.7-4**, the Project would be consistent with the stated goals of the RTP/SCS. Therefore, the Project would not result in any significant impacts or interfere with SCAG's ability to achieve the region's GHG emission reduction target of 19 percent by the year 2035 or the post-2020 mobile source GHG reduction targets. (**DEIR at 4.7-21 to 4.7-22**).

Consistency with the 2022 CARB Scoping Plan

The 2022 Scoping Plan sets a path to achieve targets for carbon neutrality and reduce anthropogenic GHG emissions by 85 percent below 1990 levels by 2045 in accordance with AB 1279. The transportation, electricity, and industrial sectors are the largest GHG contributors in the State. The 2022 Scoping Plan plans to achieve the AB 1279 targets primarily through zero-emission transportation (e.g., electrifying cars, buses, trains, and trucks). Additional GHG reductions are achieved through decarbonizing the electricity and industrial sectors.

Statewide strategies to reduce GHG emissions in the latest 2022 Scoping Plan include implementing SB 100, which would achieve 100 percent clean electricity by 2045; achieving 100 percent zero emission vehicle sales in 2035 through Advanced Clean Cars II; and implementing the Advanced Clean Fleets regulation to deploy zero-electric (ZEV) vehicle buses and trucks. Additional transportation policies include the Off-Road Zero-Emission Targeted Manufacturer

rule, Clean Off-Road Fleet Recognition Program, In-use Off-Road Diesel-Fueled Fleets Regulation, Off-Road Zero-Emission Targeted Manufacturer rule, Clean Off-Road Fleet Recognition Program, and Amendments to the In-use Off-Road Diesel-Fueled Fleets Regulation. The 2022 Scoping Plan would continue to implement SB 375. GHGs would be further reduced through the Cap-and-Trade Program carbon pricing and SB 905. SB 905 requires CARB to create the Carbon Capture, Removal, Utilization, and Storage Program to evaluate, demonstrate, and regulate carbon dioxide removal projects and technology.

As indicated in **DEIR Table 4.7-3**, approximately 93 percent of the Project's mitigated GHG emissions are from mobile sources that would be further reduced by the 2022 Scoping Plan measures. The City has no control over vehicle emission standards. However, these emissions would decline in the future due to Statewide measures discussed above, as well as cleaner technology and fleet turnover. Several of the State's plans and policies would contribute to a reduction in mobile source emissions from the Project. These include the following:

CARB's Advanced Clean Truck Regulation: Adopted in June 2020, CARB's Advanced Clean Truck Regulation requires truck manufacturers to transition from diesel trucks and vans to electric zero-emission trucks beginning in 2024. By 2045, every new truck sold in California is required to be zero-emission. The Advanced Clean Truck Regulation accelerates the transition of zero-emission medium-and heavy-duty vehicles from Class 2b to Class 8.

- **Executive Order N-79-20**: Executive Order N-79-20 establishes the goal for all new passenger cars and trucks, as well as all drayage/cargo trucks and off-road vehicles and equipment, sold in California, will be zero-emission by 2035 and all medium and heavy-duty vehicles will be zero-emission by 2045. It also directs CARB to develop and propose rulemaking for passenger vehicles and trucks, medium-and heavy-duty fleets where feasible, drayage trucks, and off-road vehicles and equipment "requiring increasing volumes" of new ZEVs "towards the target of 100 percent."
- **CARB's Mobile Source Strategy**: CARB's Mobile Source Strategy takes an integrated planning approach to identify the level of transition to cleaner mobile source technologies needed to achieve all of California's targets by increasing the adoption of ZEV buses and trucks.
- **CARB's Sustainable Freight Action Plan**: The Sustainable Freight Action Plan which improves freight system efficiency, utilizes near-zero emissions technology, and deployment of ZEV trucks. This Plan applies to all trucks accessing the Project site and may include existing trucks or new trucks that are part of the statewide goods movement sector.
- **CARB's Emissions Reduction Plan for Ports and Goods Movement**: CARB's Emissions Reduction Plan for Ports and Goods Movement identifies measures to improve goods movement efficiencies such as advanced combustion strategies, friction reduction, waste heat recovery, and electrification of accessories.

While these measures are not directly applicable to the Project, any commercial activity associated with goods movement would be required to comply with these measures as adopted. The Project would not obstruct or interfere with efforts to increase ZEVs or State efforts to improve system efficiency, nor conflict with the State's progress towards carbon neutrality under the 2022 Scoping

Plan. The Project would also not convert any Natural and Working Lands and/or decrease the urban forest carbon stock in the State, which are areas of emphasis in the 2022 Scoping Plan. In conclusion, the Project does not conflict with the applicable plans that are discussed above. Therefore, impacts would be less than significant with implementation of MM GHG-1 through MM GHG-4 and MM AQ-2 through MM AQ-5. (**DEIR at 4.7-24 to 4.7-25**).

5.2.6 Hazards and Hazardous Materials

Potential Significant Impact (Threshold 4.8-1): The EIR evaluated and concluded that the Project could create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.

Finding: Based on the entire record, the City Council finds that this impact is potentially significant, but can be mitigated to a less than significant level through implementation of Mitigation Measure HAZ-1. This Mitigation Measure is adopted and incorporated into the MMRP for the Project and will be implemented as specified therein, thereby reducing this potentially significant impact to a less than significant level. The impacts related to this issue area are discussed in detail in Section 4.8 of the DEIR. The following Mitigation Measure will mitigate impacts related to hazards to the public or the environment through the routine transport, use, or disposal of hazardous materials to below a level of significance:

Mitigation Measure

MM HAZ-1 Asbestos Survey and Lead-Based Paint Survey. Prior to approval of a demolition permit by the City of Rialto, an asbestos survey and a lead-based paint survey shall be conducted pursuant to applicable local, State, and federal laws. All asbestos-containing building materials shall be removed prior to structure demolition. Abatement or paint stabilization techniques shall be applied prior to demolition. Such measures shall include removal and stabilization of loose, flaking or peeling paint. Measures shall be taken to ensure that paint chips are not generated in the demolition process. All work shall be performed by an abatement contractor who is certified by the California OSHA Division of Occupational Safety and Health (Cal/OSHA) with properly trained and registered workers. All abatement techniques shall be in accordance with Cal-OSHA and U.S. Environmental Protection Agency (U.S. EPA) protocol and also in conformance with South Coast Air Quality Management District (SCAQMD) rules. All removed asbestos-containing building materials and lead-based paint shall be properly disposed of at a landfill certified to accept said materials, and waste shall be transported under the waste manifest by a certified waste transportation company. Once all of these materials have been removed, structure demolition may commence.

Facts in Support of the Finding:

Construction

The proposed Project would include the demolition of the ammunitions bunker and brick and mortar structure, which were constructed in the 1940s. Given the age of these structures, asbestos-

containing materials (ACMs) and lead-based paint (LBP) could be present. Demolition of structures could expose construction personnel to such materials unless proper precautions are taken to minimize exposure. The potential for release of ACMs and LBP during demolition would be considered a significant impact. Because exposure to such materials can result in adverse health effects in uncontrolled situations, regulations and guidelines pertaining to abatement of and protection from exposure to asbestos have been developed for demolition activities. Consistent with SCAQMD Rule 1403, MM HAZ-1 requires a pre-demolition survey to be conducted, and, if identified, ACMs and LBP would be removed and disposed of by qualified contractors in accordance with State regulations.

Project construction activities would involve the transport, use, and disposal of hazardous materials on and off of the Project site that include fuels, paints, mechanical fluids, and solvents. However, hazardous materials would not be present in such a quantity or used in a manner that would pose a significant hazard to the public. Use and storage of these potentially hazardous materials would be temporary and would cease upon completion of Project construction. Further, should a spill or other hazardous materials incident occur, construction staff would stop work and contact a qualified contractor that is well-versed in handling such a situation. All construction activities would be performed in compliance with the California OSHA Division of Occupational Safety and Health (Cal/OSHA) regulations. Therefore, due to the temporary nature of construction activities, with the implementation of MM HAZ-1 and compliance with applicable State and federal regulations, potential Project construction activities would be mitigated to a less than significant level. (**DEIR at 4.8-18**).

Operations

The proposed Project would include a speculative warehouse. While the future tenants of the building are not currently known, the Project is not anticipated to involve the routine transportation, use, or disposal of hazardous material. The proposed Project would be expected to use limited hazardous materials and substances, which would include cleaners, paints, solvents, and fertilizers and pesticides for site landscaping. Project operations would not create a significant impact through the transport, use, or disposal of hazardous materials since the facilities are required to comply with all applicable federal, State, and regional regulations which are intended to avoid impacts to the public and environment. These regulations of the U.S. EPA, the State Department of Health Services, and the SCAQMD ensure that hazardous materials/waste users, generators and transporters provide operational safety and measures to reduce threats to public health and safety. Therefore, given the insignificant amount of regularly transported hazardous materials and compliance with applicable State and federal regulations, Project operations would not create a significant impact through the transport, use, or disposal of hazardous materials. Impacts would be less than significant, and no mitigation would be required for operational impacts. (**DEIR at 4.8-18**).

The routine transport, use, and disposal of hazardous materials can result in hazards to people and the environment, due to the potential for accidental release. Such hazards are typically associated with certain types of land uses, such as chemical manufacturing facilities, industrial processes, waste disposal, and hazardous material storage and distribution facilities. At full buildout, the Project would include one warehouse building and associated infrastructure improvements. This

land use is not expected to use significant quantities of hazardous materials or to generate significant quantities of hazardous materials requiring transport. The routine transport, use, and disposal of these materials must adhere to federal, State, and local regulations for transport, handling, storage, and disposal of hazardous substances; such as the Hazardous Materials Transportation Act and Hazardous Materials Release Response Plans and Inventory Act, which address safe handling procedures and emergency response procedures in the event of an accidental release. Therefore, following compliance with applicable federal, State, and local regulations, Project operations would not result in a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials. Impacts would be less than significant, and no mitigation would be required. (**DEIR at 4.8-19**).

Potential Significant Impact (Threshold 4.8-2): The EIR evaluated and concluded that the Project could create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.

Finding: Based on the entire record, the City Council finds that this impact is potentially significant but can be mitigated to a less than significant level through implementation of Mitigation Measures HAZ-2 through HAZ-4. These Mitigation Measures are adopted and incorporated into the MMRP for the Project and will be implemented as specified therein, thereby reducing this potentially significant impact to a less than significant level. The impacts related to this issue area are discussed in detail in Section 4.8 of the DEIR. The following Mitigation Measures will mitigate impacts related to hazards to the public or the environment due to upset and accident conditions involving the release of hazardous materials into the environment to below a level of significance:

Mitigation Measures

MM HAZ-2 Munitions Monitor. Prior to issuance of grading permits, the Applicant shall submit proof to the City of Rialto Director of Community Development of the retainment of a munitions expert. A munitions expert must be an individual that is qualified to perform appropriate tasks per Department of Defense Explosives Safety Board Technical Paper-18 (DDESBP TP-18) standards. The munitions expert shall be onsite to monitor grading activities for unexploded ordinances (UXOs) and discarded military munitions (DMMs) and provide daily safety briefings before the start of construction. If UXOs are encountered during this process, the munitions expert shall have the authority to halt all or a portion of construction activities and contact the City of Rialto Police department at (909) 820-2550 to report and determine proper UXO handling and disposal. The munitions expert shall have the authority to halt all or a portion of construction activities at their discretion until such time that an encountered UXO is deemed properly disposed of.

MM HAZ-3 Soil Management Plan. Prior to the issuance of a grading permit, the Applicant shall submit a Soil Management Plan (or equivalent document) to be implemented for construction of the Proposed Project. The objective of the Soil Management Plan is to provide guidance for the proper handling, onsite management, and disposal of impacted soil that might be encountered during construction activities. The plan would include practices that are consistent with the

California Title 8, Occupational Safety and Health Administration (Cal-OSHA) regulations, as well as appropriate remediation standards that are protective of the planned use. Appropriately trained professionals would be on site during preparation, grading, and related earthwork activities to monitor soil conditions encountered. The Soil Management Plan would provide guidelines for the following:

- Identifying impacted soil
- Assessing impacted soil
- Soil excavation
- Impacted soil storage
- Verification sampling
- Impacted soil characterization and disposal

The plan shall outline how Project construction crews would identify, handle, and dispose of potentially contaminated soil; identify the qualifications of the appropriately trained professionals that would monitor soil conditions and conduct soil sampling during construction; coordinate laboratory testing; and oversee disposal. The Soil Management Plan shall also include requirements for documenting and reporting incidents of encountered contaminants, such as documenting locations of occurrence, sampling results, and reporting actions taken to dispose of contaminated materials. In the event that potentially contaminated soils were encountered within the footprint of construction, soils would be tested and stockpiled. The appropriate Certified Unified Program Agency (CUPA) would determine whether further assessment is warranted. The Soil Management Plan shall be submitted to the city and CUPA 45 days prior to the start of construction for review and approval.

MM HAZ-4 Contaminated Soil Treatment. If previously unidentified soil contamination is observed by sight or odor or indicated by testing by a qualified professional using a portable volatile organic compound analyzer during excavation and grading activities, excavation and grading within such an area shall be temporarily halted and redirected around the area until the appropriate evaluation and follow-up measures are implemented, as contained in the South Coast Air Quality Management District's Rule 1166, to make the area suitable for grading activities to resume. In the event contamination is found, the Applicant shall notify the San Bernardino County Fire Department and the South Coast Air Quality Management District, as applicable. The contaminated soil shall be evaluated and excavated/disposed of, treated in-situ (in-place), or otherwise managed and disposed of in accordance with all applicable federal, State, and local laws and regulations.

Facts in Support of the Finding:

Construction

The Phase I ESA (**Draft EIR, Appendix G1**) identified three RECs at the Project site: the Project site's location within the "160 Acre Area" and "Former Bunker Area" and off-site releases resulting in the Fireworks, Rockets, and Flares Superfund; the historical use of the site for munitions storage; and the unknown suspected use of the site by historic adjacent pyrotechnic facilities. The Phase II ESA (**Draft EIR, Appendix G2**) included a UXO review, geophysical survey, soil sampling and soil vapor sampling and evaluated whether significant releases of hazardous substances have occurred at the Project site including VOCs, organochlorine pesticides, and percolate.

A subsurface evaluation as part of the Phase II ESA included a focused survey, which did not identify the presence of UXOs or DMMs. However, because the survey could not evaluate the entire Project site due to physical limitations, there is still a potential of on-site UXOs and DMMs. Therefore, the proposed Project would implement MM HAZ-2, which would involve a munitions monitor during grading to properly handle and dispose of any encountered UXOs and DMMs.

Further, MM HAZ-3 would require the preparation of and compliance with a soil management plan. With implementation of MM HAZ-2 and MM HAZ-3, accident conditions involving the release of hazardous materials from Project construction would be reduced to a less than significant level.
Soil sampling and soil vapor sampling indicated that benzene was detected at generally low levels at 33 micrograms/m^3 and indicated that a residual benzene source likely does not exist at the Project site. Further, the levels of benzene observed in the soil vapor are commonly observed at commercial and industrial properties. Therefore, benzene in soil vapor does not pose a significant human health risk to indoor air via the vapor intrusion pathway.

The Phase II ESA concluded that the soil and soil vapor results do not suggest that the release of hazardous substances has occurred at the Project site that would result in contamination to the underlying groundwater. Although benzene was identified at low levels, to ensure impacts would be less than significant the Project would implement MM HAZ-4, which outlines compliance with Rule 1166 for previously unidentified soil contamination protocol during Project construction. With the implementation of MM HAZ-4, accident conditions involving the release of hazardous materials from Project construction would be reduced to a less than significant level.

The Project site was not determined to be a contributor to the plume that is the basis for the RFF Superfund site designation. Based on these results, the items previously identified as RECs have been revised to "de minimis" (of minimal environmental concern) conditions because they do not present a threat to human health or the environment. Therefore, with the implementation of MM HAZ-2 through MM HAZ-4, Project construction impacts concerning accidental release of hazardous materials would be less than significant with mitigation. (**DEIR at 4.8-19 to 4.8-20**).

Operations

The proposed Project would involve typical hazardous materials/chemicals associated with warehouse uses such as fuels, paints, mechanical fluids, cleaners, solvents, and fertilizers and pesticides for landscaping. However, the types and quantities of materials used and stored on site would not be of a significant quantity to create a reasonably foreseeable upset or accident. Additionally, any routine use, storage, and transport of hazardous materials during Project operations must adhere to federal, State, and local regulations for transport, handling, storage, and disposal of hazardous substances. Hazardous materials/chemicals such as fuels, cleaners, paints, solvents and fertilizers in low quantities do not pose a significant threat related to the release of hazardous materials into the environment. Therefore, Project operations would not result in the accidental release of hazardous materials. Operational impacts would be less than significant, and no mitigation is required. (**DEIR at 4.8-20**).

Potential Significant Impact (Threshold 4.8-4): The EIR evaluated and concluded that the Project is located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, could create a significant hazard to the public or the environment.

Finding: Based on the entire record, the City Council finds that this impact is potentially significant but can be mitigated to a less than significant level through implementation of Mitigation Measures HAZ-2 through HAZ-4. These Mitigation Measures are adopted and incorporated into the MMRP for the Project and will be implemented as specified therein, thereby reducing this potentially significant impact to a less than significant level. The impacts related to this issue area are discussed in detail in Section 4.8 of the DEIR. The following Mitigation Measures will mitigate impacts related to hazards to the public or the environment due to upset and accident conditions involving the inclusion within a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 to below a level of significance:

Mitigation Measures

Implement MMs HAZ-2 to HAZ-4.

Facts in Support of the Finding: California Government Code Section 65962.5 requires DTSC to compile a list of hazardous waste facilities that are subject to corrective action. As previously addressed, the Project site is located in the southern portion of the "160-Acre Area" and the "Former Bunker Area" of the RFF Superfund site, which was identified as a REC in the Phase I ESA prepared for the Project. Therefore, a Phase II ESA was conducted which included an unexploded ordnance (UXO) review, geophysical survey, soil sampling and soil vapor sampling and evaluated whether significant releases of hazardous substances have occurred at the Project site including VOCs, organochlorine pesticides, and percolate. As previously discussed under Threshold 4.8-2, the Phase II ESA identified the potential presence of on-site UXOs and DMMs. Therefore, the proposed Project would implement MM HAZ-2 which would require a munitions monitor and MM HAZ-3 which would require a soil management plan.

Additionally, the Phase II ESA concluded that the soil and soil vapor results do not suggest that release of hazardous substances has occurred at the Project site that would result in contamination to the underlying groundwater. Although benzene was identified at low levels and would not pose a human health risk, the Project would implement MM HAZ-4, which outlines compliance with Rule 1166 for previously unidentified soil contamination protocol during Project construction. Overall, the Phase II ESA determined that the Project site would not be a contributor to the plume that is the basis for the RFF Superfund site designation. Therefore, although the Project site is located within the RFF Superfund site, based on the Phase II ESA findings and compliance with MM HAZ-2 through MM HAZ-4, implementation of the Project would not create a significant hazard to the public or the environment and impacts would be reduced to a less than significant level. (**DEIR at 4.8-21**).

Cumulative Impacts

Impacts associated with hazardous materials are often site-specific and localized. The EIR evaluates potential environmental concerns in connection with the Project site and surrounding area. The Environmental Data Resources, Inc. database reviews the findings of various governmental database searches regarding properties with known or suspected releases of hazardous materials or petroleum hydrocarbons within a search radius of up to one mile from the site and serves as the basis for defining the cumulative impacts study area. Although some of the cumulative projects and other future projects associated with community buildout also have potential impacts associated with hazardous materials, the environmental concerns associated with hazardous materials are typically site-specific, excluding the RFF Superfund, and would not be cumulatively significant. Concerning the RFF Superfund, the Project would not disturb the underlying affected groundwater plume as the Project is not anticipated to excavate to a depth of 400 feet below ground surface and, therefore, would not modify or expose the existing Eastern Plume below the Project site (**DEIR at 4.8-22**).

Each project is required to address any issues related to hazardous materials or wastes. Cumulative development projects would be required to assess potential hazardous materials impacts on the development site prior to grading. The Project and other cumulative projects would be required to comply with laws and regulations governing hazardous materials and hazardous wastes used and generated as described previously. Projects must adhere to applicable regulations for the use, transport, and disposal of hazardous materials and implement mitigation in compliance with federal, State, and local regulations to protect against site contamination by hazardous materials. Compliance with all applicable federal, State, and local regulations related to hazardous materials would ensure that the routine transport, use, or disposal of hazardous materials would not result in adverse impacts. Additionally, site-specific investigations would be conducted at sites where contaminated soils or groundwater could occur to minimize the exposure of workers and the public to hazardous substances.

Upon compliance with applicable federal, State, and local regulations governing hazardous materials, and implementation of MM HAZ-1, MM HAZ-2, MM HAZ-3, and MM HAZ-4, the potential risks associated with hazardous wastes would be reduced to a level of less than significant. The incremental effects of the proposed Project related to hazards and hazardous materials are anticipated to be minimal, and any effects would be site-specific. Therefore, the

Project would not result in incremental effects to hazards with respect to hazardous materials that could be compounded or increased when considered together with similar effects from other past, present, and reasonably foreseeable probable future projects. Therefore, with inclusion of the above referenced Mitigation Measures, the Project would not result in cumulatively considerable impact to or from hazards or hazardous materials. (**DEIR at 4.8-22**).

5.2.7 Noise

Potential Significant Impact (Threshold 4.12-1): The EIR evaluated and concluded that the Project could generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.

Finding: Based on the entire record, the City Council finds that this impact is potentially significant but can be mitigated to a less than significant level through implementation of Mitigation Measure NOI-1. This Mitigation Measure is adopted and incorporated into the MMRP for the Project and will be implemented as specified therein, thereby reducing this potentially significant impact to a less than significant level. The impacts related to this issue area are discussed in detail in Section 4.12 of the DEIR. The following Mitigation Measure will mitigate impacts related to noise increases to below a level of significance:

Mitigation Measure

MM NOI-1: Noise Shielding and Muffling. Power construction equipment (including combustion engines), fixed or mobile, shall be equipped with noise shielding and muffling devices consistent with manufacturers' standards or the Best Available Control Technology, which achieve a noise reduction of 10 dBA or greater. All equipment shall be properly maintained, and the Applicant or Owner shall require any construction contractor to keep documentation on-site during any earthwork or construction activities demonstrating that the equipment has been maintained in accordance with manufacturer's specifications.

Facts in Support of the Finding:

Construction

Construction noise typically occurs intermittently and varies depending on the nature or phase of construction (e.g., land clearing, grading, excavation, paving). Noise generated by construction equipment, including earthmovers, material handlers, and portable generators, can reach high levels. The nearest sensitive receptors are approximately 700 feet to the east and southeast of the Project site. Construction activities would include demolition, site preparation, grading, building construction, paving, and architectural coating, and infrastructure improvement. Such activities would require dozers, excavators, and concrete saws during demolition; graders, dozers, excavators, scrapers and tractors during site preparation and grading; cranes, forklifts, generators, tractors, and welders during building construction; pavers, rollers, and paving equipment during paving; air compressors during architectural coating; and excavators, pavers, dozers, and rollers during infrastructure improvements. Typical operating cycles for these types of construction equipment may involve one or two minutes of full power operation followed by three to four minutes at lower power settings. Other primary sources of acoustical disturbance would be random incidents, which would last less than one minute (such as dropping large pieces of equipment or the hydraulic movement of machinery lifts). Noise generated by construction equipment, including earthmovers, material handlers, and portable generators, can reach high levels. (**DEIR at 4.12-16**).

Typical noise levels associated with individual construction equipment are listed in **DEIR Table 4.12-9: Typical Construction Equipment Noise Levels**. The Rialto Municipal Code (Municipal Code) does not establish quantitative construction noise standards. Therefore, this analysis uses the Federal Transportation Authority's (FTA's) threshold of 80 dBA (8-hour L_{eq}) for residential uses and 90 dBA (8-hour L_{eq}) for non-residential uses to evaluate construction noise impacts, as well as a review of any increase in ambient noise at nearby sensitive uses (i.e., residential use) by applying an ambient noise level increase threshold of 5 dBA. The noise levels identified in **DEIR Table 4.12-10: Project Construction Noise Levels**, show estimated unmitigated and mitigated exterior construction noise without accounting for attenuation from existing physical barriers. The nearest noise-sensitive receptors are the residential uses located 700 feet to the east and 700 feet to the southeast of the Project site. Additionally, the nearest non-noise sensitive use (i.e., industrial use) is located adjacent to the Project site. As shown in the table, unmitigated exterior construction noise levels could reach 87.5 dBA at the nearest non-noise sensitive use (i.e., industrial use) to the Project site. Therefore, unmitigated exterior construction noise levels at the nearest non-noise sensitive use would not exceed the FTA's 90 dBA L_{eq} threshold. (**DEIR at 4.12-16 to 4.12-17**).

Additionally, unmitigated exterior construction noise levels would range from 50.8 dBA to 64.6 dBA at the nearest noise sensitive uses (i.e., residential uses) to the Project site and the FTA's 80 dBA L_{eq} threshold would not be exceeded (**Table 4.12-10**). Unmitigated construction noise levels at the nearest sensitive uses, however, would exceed the ambient noise threshold during all phases of construction, with the exception of the architectural coating phase. Therefore, the Project would implement Mitigation Measure (MM) NOI-1 to reduce construction noise levels to levels that would not exceed the ambient noise thresholds. MM NOI-1 would require the proper maintenance of construction equipment and the installation of noise shielding/muffling devices. (**DEIR at 4.12-19**).

The Federal Highway Administration states that muffler systems can reduce noise levels by 10 dBA or more. As identified in **Table 4.12-10**, mitigated exterior construction noise levels at noise sensitive uses would not exceed the ambient noise thresholds. Construction equipment would operate throughout the Project site and the associated noise levels would not occur at a fixed location for extended periods of time. Although some sensitive uses may be exposed to elevated noise levels during Project construction, heavy construction equipment would be in motion and construction noise would be acoustically dispersed throughout the Project site (i.e., not concentrated in one area near sensitive uses). The City has set restrictions on construction hours to control noise impacts from construction activities. Municipal Code Section 9.50.070 states that construction activities may only take place between the hours of 7:00 AM and 5:30 PM on weekdays and between the hours of 8:00 AM and 5:00 PM on Saturdays from October 1 through April 30 and shall only occur between 6:00 AM and 7:00 PM on weekdays and between the hours of 8:00 AM and 5:00 PM on Saturdays from May 1 through September 30. The Project would be required to comply with the allowable hours of construction set in the Municipal Code. Project construction noise levels would not exceed the FTA or ambient noise thresholds with implementation of MM NOI-1 and impacts would therefore be less than significant. (**DEIR at 4.12-19**).

Operations

Implementation of the proposed Project would create new sources of noise. The major noise sources associated with the Project that would potentially impact existing and future sensitive receptors include the following: mechanical equipment, truck and loading dock noise, back-up alarms, parking areas, and off-site traffic noise. Municipal Code Section 9.50.050 identifies activities that are unlawful to engage in between the hours of 8:00 PM and 7:00 AM. This includes the loading or unloading any vehicle, or operate or permit the use of dollies, carts, forklifts, or other wheeled equipment that causes any impulsive sound, raucous or unnecessary noise within one thousand feet of a residence. However, Municipal Code Section 9.50.060 notes that sounds generated in commercial and industrial zones that are necessary and incidental to the uses permitted therein are exempt from the provisions of the Municipal Code Chapter 9.50 (Noise Control) including Section 9.5.050 (Controlled Hours of Operation). Additionally, all loading and unloading activities, including the operation of dollies, carts, and forklifts, would occur within the warehouse buildings while trucks are docked. Loading dock doors would also be surrounded with protective aprons, gaskets, or similar improvements that, when a trailer is docked, would serve as a noise barrier between the interior warehouse activities and the exterior loading area. This would attenuate noise emanating from interior activities, and as such, interior loading and associated activities would be permissible during all hours of the day. (**DEIR at 4.12-19 to 4.12-20**).

Mechanical Equipment. Potential stationary noise sources related to long-term operations would include mechanical equipment. Mechanical equipment (e.g., heating ventilation and air conditioning [HVAC] equipment) typically generates noise levels of approximately 52 dBA at 50 feet. HVAC units would be installed on the roof of the proposed warehouse building. The nearest residential sensitive receptors (residential uses to the east/southeast) would be located as close as 2,125 feet from the HVAC equipment at the Project site. At this distance mechanical equipment noise would attenuate to approximately 19.4 dBA, which is well below the City's normally

acceptable residential exterior noise standard (60 dBA). Operation of mechanical equipment would not increase ambient noise levels at sensitive receptors .

Additionally, industrial uses would be located approximately 115 feet southeast from the warehouse building and the mechanical equipment. At this distance, mechanical equipment noise levels would be approximately 44.8 dBA, which is well below the City's normally acceptable exterior noise standard (75 dBA) for general industrial land uses. Further, intervening structures are located between the proposed warehouse structure and the receptors to the east, which would further attenuate HVAC noise levels. Therefore, noise levels associated with mechanical equipment would not exceed the City's noise standards and noise impacts would be less than significant. (**DEIR at 4.12-20**).

Truck and Loading Dock Noise. During loading and unloading activities, noise would be generated by the trucks' diesel engines, exhaust systems, and brakes during low gear shifting braking activities; backing up toward the docks; dropping down the dock ramps; and maneuvering away from the docks. Loading or unloading activities would occur on the eastern side of the Project site next to the warehouse building. Typically, heavy truck operations generate a noise level of 70 dBA at a distance of 50 feet. The closest sensitive receptors would be the single-family residences located approximately 1,880 feet east of the nearest proposed loading areas. At this distance, heavy truck and loading dock noise levels would be 38.5 dBA, which would not exceed the City's normally acceptable residential exterior noise standard (60 dBA). Heavy truck operations would not increase ambient noise levels at sensitive receptors. Additionally, industrial uses would be located approximately 200 feet southeast from the proposed loading areas. At this distance, heavy truck and loading dock noise levels would be approximately 58.0 dBA, which is well below the City's normally acceptable exterior noise standard (75 dBA) for general industrial land uses. Heavy truck and loading dock noise levels at the nearest sensitive receptors would be further attenuated by intervening structures. Finally, loading dock doors would also be surrounded with protective aprons, gaskets, or similar improvements that, when a trailer is docked, would serve as a noise barrier between the interior warehouse activities and the exterior loading area. This would attenuate noise emanating from interior activities, and as such, interior loading and associated activities would be permissible during all hours of the day. Therefore, noise levels associated with trucks and loading or unloading activities would not exceed the City's noise standards and noise impacts would be less than significant. (**DEIR at 4.12-20 to 4.12-21**).

Back-Up Alarms. Medium and heady-duty trucks reversing into loading docks would produce noise from back-up alarms (also known as back-up beepers). Back-up alarms produce a typical volume of 97 dBA at one meter (3.28 feet) from the source. The closest sensitive receptors would be the single-family residences located approximately 1,880 feet east of the loading dock areas where trucks could be reversing and maneuvering. At this distance, exterior noise levels from back-up alarms would be approximately 41.8 dBA, which is below the City's normally acceptable residential exterior noise standard (60 dBA). Back-up alarms would not increase ambient noise levels at sensitive receptors. Additionally, industrial uses would be located approximately 200 feet southeast from the proposed loading areas where trucks could be reversing and maneuvering. At this distance, back-up alarm noise levels would be approximately 61.3 dBA, which is well below the City's normally acceptable exterior noise standard (75 dBA) for general industrial land

uses. Therefore, noise levels associated with back-up alarms would not exceed the City's noise standards and noise impacts would be less than significant. (**DEIR at 4.12-21**).

Parking Noise. The proposed Project would provide 365 passenger vehicle surface parking spaces and 398 truck trailer parking stalls. The Project would generate up to 200 trips during the peak hour. For the purpose of providing a conservative, quantitative estimate of the noise levels that would be generated from the vehicles entering and exiting the parking lots, the methodology recommended by FTA for the general assessment of stationary transit noise sources is used. Using FTA's reference noise level of 92 dBA SEL at 50 feet from the noise source, the Project's highest peak hour vehicle trips would generate noise levels of approximately 49.4 dBA L_{eq} at 50 feet from the parking lot. Parking lot noise would occur within the surface parking lots on the Project site. Parking lot noise occurs at the surrounding industrial uses under existing conditions. Parking lot noise would be consistent with the existing noise in the vicinity and would be partially masked by background noise from traffic along surrounding roadways. The closest sensitive receptors would be the single-family residences located approximately 710 feet east of the nearest parking area and east of Locust Avenue. At this distance, parking lot noise levels would be approximately 26.4 dBA, which is below the City's normally acceptable residential exterior noise standard (60 dBA). Parking lot activities would not increase ambient noise levels at sensitive receptors. Additionally, industrial uses would be located approximately 30 feet southeast from the parking areas. At this distance, parking lot noise levels would be approximately 53.8 dBA, which is well below the City's normally acceptable exterior noise standard (75 dBA) for general industrial land uses. Noise associated with parking lot activities is not anticipated to exceed the City's noise standards during operation. Therefore, noise impacts from parking lots would not exceed the City's noise standards and noise impacts would be less than significant. (**DEIR at 4.12-21 to 4.12-22**).

Off-Site Traffic Noise. Implementation of the Project would generate increased traffic volumes along nearby roadway segments. The Project would result in approximately 1,138 daily vehicle trips. In general, traffic noise level increases of less than 3-dBA is barely perceptible to people, while a 5-dBA increase is readily noticeable. Generally, traffic volumes on area roadways would have to approximately double for the resulting traffic noise levels to increase by 3 dBA. Therefore, permanent increases in ambient noise levels of less than 3 dBA are considered to be less than significant. The Opening Year "Opening Year With Project" and "Opening Year Without Project" scenarios are compared in **DEIR Table 4.12-11: Opening Year Traffic Noise Levels**. As shown in the table, roadway noise levels would range from 68.5 dBA CNEL to 70.7 dBA CNEL without the Project and between 69.1 dBA CNEL and 71.5 dBA CNEL with the Project. The "With Project" noise levels would result in a maximum increase of 1.2 dBA CNEL along North Locust Avenue (between Lowell Street to Persimmon Avenue). No significant impacts would occur and no mitigation is required for off-site traffic noise. (**DEIR at 4.12-22**).

5.2.8 Tribal Cultural Resources

Potential Significant Impact (Threshold 4.16-1): The EIR evaluated and concluded that the Project could cause a substantial adverse change in the significance of a tribal cultural resource defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is: (a) listed or eligible

for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k); or (b) a resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency will consider the significance of the resource to a California Native American tribe.

Finding: Based on the entire record, the City Council finds that these impacts are potentially significant but can be mitigated to a less than significant level through implementation of Mitigation Measures MM CUL-2, MM CUL-3, MM CUL-5, and MM TCR-1 through MM TCR-3. These Mitigation Measures are adopted and incorporated into the MMRP for the Project, and will be implemented as specified therein, thereby reducing this potentially significant impact to a less than significant level. The impacts related to this issue area are discussed in detail in Section 4.16 of the DEIR. The following Mitigation Measures will mitigate Project-level and cumulative impacts related to tribal cultural resources to below a level of significance:

Mitigation Measures

Implement MMs CUL-2, CUL-3 and CUL-5; and the following:

MM TCR-1 Native American Monitoring for Gabrieleño Band of Mission Indians – Kizh Nation. The Project Applicant shall retain a Native American Monitor from or approved by the Gabrieleño Band of Mission Indians – Kizh Nation. The monitor shall be retained prior to the commencement of the first permit that would result in a "ground-disturbing activity" for the subject project at all project locations (i.e., both on-site and any off-site locations that are included in the project description/definition and/or required in connection with the project, such as public improvement work). "Ground-disturbing activity" shall include, but is not limited to, demolition, pavement removal, potholing, auguring, grubbing, tree removal, boring, grading, excavation, drilling, and trenching.

A copy of the executed monitoring agreement shall be submitted to the City of Rialto prior to the commencement of any ground-disturbing activity, or the issuance of any permit necessary to commence a ground-disturbing activity. The agreement would also address the consideration of rotating monitoring with the Morongo Band of Mission Indians.

The monitor shall complete monitoring logs that provide descriptions of the relevant ground-disturbing activities, the type of construction activities performed, locations of ground-disturbing activities, soil types, cultural-related materials, and any other facts, conditions, materials, or discoveries of significance to the Tribe. Monitor logs shall identify and describe any discovered TCRs, including but not limited to, Native American cultural and historical artifacts, remains, places of significance, etc., (collectively, tribal cultural resources, or "TCR"), as well as any discovered Native American (ancestral) human remains and burial goods. Copies of monitor logs shall be provided to the Project Applicant/City of Rialto upon written request to the Tribe. On-site tribal monitoring shall conclude upon one of the following (1) written confirmation to the Kizh

from a designated point of contact for the Project Applicant or City of Rialto that all ground-disturbing activities and phases that may involve ground-disturbing activities on the project site or in connection with the Project are complete; or (2) a determination and written notification by the Kizh to the Project Applicant or City of Rialto that no future, planned construction activity and/or development/construction phase at the project site possesses the potential to impact Kizh TCRs.

MM TCR-2 Native American Monitoring for Morongo Band of Mission Indians. Prior to the issuance of the first permit that would result in a "ground-disturbing activity," the Applicant shall enter into a Tribal Monitoring Services Agreement with the Morongo Band of Mission Indians for the Project. The agreement would also address the consideration of rotating monitoring with the Gabrieleño Band of Mission Indians – Kizh Nation. The Tribal Monitor shall be on-site during all (or as deemed necessary) ground-disturbing activities (including, but not limited to, clearing, grubbing, tree and bush removal, grading, trenching, fence post placement and removal, construction excavation, excavation for all utility and irrigation lines, and landscaping phases of any kind). The Tribal Monitor shall have the authority to temporarily divert, redirect, or halt the ground-disturbing activities to allow identification, evaluation, and potential recovery of cultural resources. The Tribal Monitor can establish a buffer around the discovery.

MM TCR-3 Inadvertent Discovery of a Tribal Cultural Resource. The Consulting Tribes shall be contacted and informed of any pre-contact cultural resources discovered during Project implementation, and be provided information regarding the nature of the find, so as to provide Tribal input with regards to significance and treatment (pursuant to Mitigation Measure [MM] CUL-5). Should the find be deemed significant, as defined by CEQA, the find shall be addressed to the protocols outlined in the Cultural Resources Management Plan from MM CUL-2. Any and all archaeological/cultural documents created as a part of the Project (isolate records, site records, survey reports, testing reports, etc.) shall be supplied to the Project Applicant and the City of Rialto for dissemination to the Consulting Tribes.

Facts in Support of the Finding: In compliance with Public Resources Code Section 21080.3.1(b), the City provided formal notification to California Native American tribal representatives identified by the California Native American Heritage Commission. Native American groups may have knowledge about cultural resources in the area and may have concerns about the adverse effects of development on tribal cultural resources as defined in Public Resources Code Section 21074. It is unlikely that tribal cultural resources are present on the Project site, given the pedestrian survey results, record search results, Native American tribal consultations, review of archival and environmental data, and existing site disturbance. While low, there is the potential for tribal cultural resources to be inadvertently unearthed during excavation and grading activities. Therefore, Project construction activities could result in potential impacts to previously unidentified tribal cultural resources or human remains.

The Project would be subject to compliance with MM CUL-2, MM CUL-3, and MM CUL-5, which requires the preparation of a Cultural Resources Management plan to be approved by the Consulting Tribes, a cultural resource sensitivity training, and in the event a cultural resource is discovered, work shall cease within a 60 foot buffer and if the resource is Native American in origin, the Consulting Tribes shall be contacted regarding potential significance and treatment of the resource outlined in MM TCR-3. The Project would also be subject to compliance with MM

TCR-1, which requires the retention of a Native American Monitor from or approved by the Gabrieleño Band of Mission Indians – Kizh Nation, MM TCR-2 which requires a Tribal Monitoring Services Agreement with the Morongo Band of Mission Indians, and MM TCR-3, which outlines protocol in the event of discovery of a tribal cultural resource, including compliance with the Cultural Resource Management plan outlined in MM CUL-2 and coordination with the Consulting Tribes. Additionally, the Project would comply with California State Health and Safety Code Section 7050.5 and Public Resources Code Section 5097.98, as outlined in SC CUL-1, which outlines procedures and treatment in the event human remains are discovered during excavation and disturbance activities. Therefore, compliance with the established regulatory framework and the mitigation measures outlined above would reduce potential impacts to tribal cultural resources to a less than significant level. (**DEIR at 4.16-7 to 4.16-8**).

Cumulative Impacts

For purposes of cumulative impact analysis to cultural and tribal resources, the geographic context for cumulative analysis is regional and considers both direct and indirect impacts over a wide area. However, the discussion is focused on a project's potential for resulting in site-specific impact that could contribute to a cumulative loss. Accordingly, impacts are site-specific and not generally subject to cumulative impacts unless multiple projects impact a common resource, or an affected resource extends off the site. With this consideration, the cumulative analyses for tribal cultural resources considers whether the Project, in combination with the past, present, and reasonably foreseeable projects, could cumulatively affect any common resource. The Project site does not contain any known tribal cultural resources. However, the potential exists for undiscovered tribal cultural resources to be adversely impacted during groundbreaking activities. In the event that a potential tribal cultural resource is found, the Project would implement measures to mitigate further damage to the found tribal resource. Therefore, Project impacts would be reduced to a less than significant level. In addition, future cumulative development projects have the potential to encounter/adversely affect tribal cultural resources. Potential tribal cultural resource impacts associated with other project development would be site-specific and would undergo environmental and development plan review in order to evaluate potential impacts. The combination of the proposed Project as well as past, present, and reasonably foreseeable projects would be required to comply with all applicable State, federal, and local regulations concerning preservation, salvage, or handling of cultural and tribal cultural resources, including compliance with required mitigation. This also includes project-by-project consultation with the appropriate tribal representatives to discuss mitigation measures that would be included to mitigate impacts to tribal cultural resources. Therefore, the Project's contribution to cumulative impacts would be less than cumulatively considerable. (**DEIR at 4.16-8**).

5.3 SIGNIFICANT AND UNAVOIDABLE IMPACTS OF THE PROJECT.

The City Council finds that additional feasible mitigation is not available to further reduce the following Project-level and cumulative impacts related to Greenhouse Gas Emissions to a less than significant level. Therefore, the following Project impacts are significant and unavoidable.

5.3.1 Greenhouse Gases

Significant and Unavoidable Impact (Threshold 4.7-1): The EIR evaluated and concluded that although changes or alterations have been required in, or incorporated into the Project which avoid or substantially lessen the Project's GHG emissions, the Project would generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment.

Finding: Based on the entire record, the City Council finds that despite implementation of all feasible mitigation, the Project's GHG emissions are not capable of being mitigated to below a level of significance.

Mitigation Measures

Implement MM AQ-2 through MM AQ-5 and MM GHG-1 through MM GHG-4.

Facts in Support of the Finding:

Short-Term Construction Greenhouse Gas Emissions

The Project would result in direct emissions of CO_2, N_2O, and CH_4 from construction equipment and the transport of materials and construction workers to and from the Project site. The GHG emissions only occur during temporary construction activities and would cease once construction is complete. The total GHG emissions generated during the construction of the Project are shown in **DEIR Table 4.7-2: Construction-Related Greenhouse Gas Emissions**. The Project would result in the generation of approximately 1,315 $MTCO_2e$ throughout the course of construction. Construction GHG emissions are typically summed and amortized over a 30-year period and then added to the operational emissions. The Project's amortized construction emissions would be 44 $MTCO_2e$ per year. Once construction is complete, the generation of these GHG emissions would cease.

In response to the increase in warehouse development in California, the State of California Department of Justice issued a memorandum in March 2021, entitled *Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act* (Memorandum). The Memorandum encourages warehouse projects to implement certain best practices, one of which is that construction equipment not in use for more than three minutes be turned off. This Project will follow this best management practice. (**DEIR at 4.7-18**).

Long-Term Operational Greenhouse Gas Emissions

Operational or long-term emissions occur over the life of the Project. GHG emissions would result from direct emissions such as Project-generated vehicular traffic including passenger automobiles and trucks, and operation of any landscaping equipment. Operational GHG emissions would also result from indirect sources, such as off-site generation of electrical power, the energy required to convey water to, and wastewater from the Project, the emissions associated with solid waste generated from the Project, and any fugitive refrigerants from air conditioning or refrigerators. GHG emissions associated with the Project are summarized in **DEIR Table 4.7-3: Project Greenhouse Gas Emissions**. **Table 4.7-3** shows that the Project's unmitigated emissions would be approximately 11,596 $MTCO_2e$ annually from operations with amortized construction.

Therefore, Project-related GHG emissions would exceed the 3,000 $MTCO_2e$ per year threshold. The majority of the unmitigated GHG emissions (82%) are associated with non-construction related mobile sources. Emissions of motor vehicles are controlled by State and federal standards, and neither the Project Applicant nor the City has control over these standards. (**DEIR at 4.7-18**).

DEIR Section 4.2: Air Quality discusses numerous mitigation measures (MM) that would also reduce GHG emissions. For example, MM AQ-2 through MM AQ-5 have been identified to reduce operational emissions. MM AQ-2 requires the Project to use all-electric appliances, and end uses instead of natural gas appliance, as well as prohibits installation of natural gas utility lines or connections. MM AQ-3 requires landscape equipment to be 100 percent electric. MM AQ-4 requires the implementation of a Transportation Demand Management (TDM) program to reduce single-occupant vehicle trips and encourage public transit. MM AQ-5 requires outdoor cargo handling equipment to be zero emissions or alternatively fueled. Further, the Project would implement MMs GHG-1 through GHG-4. MM GHG-1 requires renewable energy to offset energy emissions. MM GHG-2 requires the Project to meet or exceed CALGreen Tier 2 standards to further improve energy efficiency. MM GHG-3 requires the Project to divert 75 percent of waste from landfills. MM GHG-4 requires the Project to implement a Water Use Efficiency and Conservation Plan. **DEIR Table 4.7-3** shows that implementation of these mitigation measures would reduce GHG emissions to 10,172 $MTCO_2e$. As previously noted, the majority of the Project's GHG emissions are generated by mobile emissions. The TDM program required by MM AQ-4 would reduce GHG emissions from commuting. (**DEIR at 4.7-19**).

Additional mitigation to reduce the Project's mobile emissions is not feasible due to the limited ability of the City to address emissions resulting from mobile sources and/or emissions generated by cars and trucks outside of the City's jurisdictional limits. As with all land use projects, the Project's mobile and transportation related GHG emissions are a function of two parameters: emissions control technology and vehicle miles traveled (VMT).

CARB is directly responsible for regulating mobile and transportation source emissions in the State. Regarding the first parameter, California addresses emissions control technology through a variety of legislation and regulatory schemes, including the State's Low Carbon Fuel Standard (Executive Order S-01-07) (LCFS), a regulatory program designed to encourage the use of cleaner low-carbon transportation fuels in California, encourage the production of those fuels, and therefore, reduce GHG emissions and decrease petroleum dependence in the transportation sector. The regulatory standards are expressed in terms of the "carbon intensity" of gasoline and diesel fuel and their substitutes. Different types of fuels are evaluated to determine their "life cycle emissions" which include the emissions associated with producing, transporting, and using the fuels. Each fuel is then given a carbon intensity score and compared against a declining carbon intensity benchmark for each year. Providers of transportation fuels must demonstrate that the mix of fuels they supply for use in California meets these declining benchmarks for each annual compliance period.

In 2018, CARB approved amendments to the LCFS, which strengthened the carbon intensity benchmarks through 2030 to ensure they are in-line with California's 2030 GHG emission reduction target enacted through SB 32. CARB is also implementing additional transportation sector regulations such as Advanced Clean Cars II, Advanced Clean Trucks, and Advanced Clean

Fleets. This ensures that the transportation sector is meeting its obligations to achieve California's GHG reduction targets. The Project would be required to comply with these regulations through vehicle manufacturer compliance. The State is also implementing legislation and regulations to address the second parameter affecting transportation related GHG emissions by controlling for VMT. Examples of this include SB 375, which links land use and transportation funding and provides one incentive for regions to achieve reductions in VMT, and SB 743, which discourages VMT increases for passenger car trips above a region-specific benchmark. Additional mitigation to further reduce the Project's non-mobile emissions would be speculative. The Project's mitigation measures address non-mobile emissions to the extent possible, by designing the warehouse building to provide environmental design features, incorporating energy and water conservation measures, and providing electrical, heating, ventilation, lighting, and power systems that meet or exceed CALGreen Standards. The State is addressing the remaining energy-related GHG emissions through SB 100 and SB 1020, which require 100 percent clean electricity retail sales by 2045.

Additionally, SB 905 requires the State to use carbon removal, carbon capture, utilization, and sequestration technologies and AB 1757 requires nature-based sequestration in natural working lands. (**DEIR at 4.7-20**). The Project would be required to comply with SCAQMD Rule 2305 which would directly reduce emissions or to otherwise facilitate emissions reductions. Alternatively, warehouse operators can choose to pay a mitigation fee. Funds from the mitigation fee will be used to incentivize the purchase of cleaner trucks and charging/fueling infrastructure in communities nearby. Although Rule 2305 focuses on air quality pollutant emissions, the rule would facilitate cleaner vehicles and supporting infrastructure that would also result in GHG reduction benefits. (**DEIR at 4.7-20 to 4.7-21**).

Warehouse owners and operators are required to earn WAIRE Points each year. WAIRE points are a menu-based system earned by emission reduction measures. Warehouse operators are required to submit an annual WAIRE Report, which includes truck trip data and emission reduction measures. WAIRE points can be earned by completing actions from a menu that can include acquiring and using natural gas, Near-Zero Emissions and/or Zero-Emissions on-road trucks, zero-emission cargo handling equipment, solar panels or zero-emission charging and fueling infrastructure, or other options. Conservatively, this analysis and the GHG emissions results presented in **DEIR Table 4.7-3** do not take credit for these potential reductions. Compliance with Rule 2305 would likely reduce emissions below what is currently analyzed. As shown in **DEIR Table 4.7-3**, mitigated GHG emissions would exceed the 3,000 $MTCO_2e$ per year threshold despite implementation of all feasible mitigation. Therefore, Project-related GHG emissions would be significant and unavoidable. (**DEIR at 4.7-21**).

Cumulative Impacts

Climate change is a global problem. GHGs are global pollutants, unlike criteria air pollutants and TACs, which are pollutants of regional and local concern. Whereas pollutants with localized air quality effects have relatively short atmospheric lifetimes (about one day), GHGs have much longer atmospheric lifetimes of one year to several thousand years that allow them to be dispersed around the globe. It is generally the case that an individual project of this size and nature is of insufficient magnitude by itself to influence climate change or result in a substantial contribution

to the global GHG inventory. GHG impacts are recognized as exclusively cumulative impacts; there are no non-cumulative GHG emission impacts from a climate change perspective. As discussed above, the Project-related GHG emissions would exceed the 3,000 $MTCO_2e$ threshold of significance despite implementation of MM GHG-1 through MM GHG-4 and MM AQ-2 through MM AQ-5 (refer to Section 4.2: Air Quality). As such, the Project would cumulatively contribute to a significant and unavoidable GHG impact. (**DEIR at 4.7-26**).

5.4 ALTERNATIVES TO THE PROPOSED PROJECT

The EIR analyzed four alternatives to the Project as proposed, and evaluated these alternatives for their ability to meet the Project's objectives. CEQA requires evaluation of alternatives that can reduce the significance of identified impacts and "feasibly attain most of the basic objectives of the Project." Thus, the Project objectives must be considered when the City Council is evaluating alternatives.

The DEIR evaluated a No Development Alternative (Alternative 1); Truck Trailer Parking Alternative (Alternative 2); Business Park Alternative (Alternative 3); and Reduced Warehouse Alternative (Alternative 4).

5.4.1 Alternative 1: No Development Alternative

Pursuant to CEQA Guidelines Section 15126.6(e)(3)(B), the "no project alternative" for a development project on identifiable property is the circumstance under which the proposed project does not proceed, and the discussion of the no project alternative must compare the environmental effects from the Project site remaining in its existing state, versus the environmental effects that would occur if the proposed Project is approved. Accordingly, under the No Development Alternative, the Project site would remain in its existing condition and no development would occur.

Because no construction or development would occur and the Project site would remain vacant under the No Development Alternative, no impacts would occur relative to most of the environmental issue areas evaluated within the DEIR. **(DEIR at 6-6 to 6-9)**. The No Development Alternative would not meet any of the Project objectives. **(DEIR at 6-9)**. Alternative 1 would fail to develop and operate a warehouse that maximizes efficient use of a vacant and underutilized site that is near available infrastructure, major freeways, and other industrial developments. Additionally, this alternative would not provide infrastructure improvements including street and sidewalk improvements, undergrounding existing utilities, and drainage and water quality treatment improvements on Lowell Street and Locust Avenue. Finally, Alternative 1 would also fail to provide expanded economic activity to the City and would also not provide additional employment opportunities. Finally, Alternative 1 would not generate any income to cover the carrying costs necessary to cover the taxes and related expenses. This would conflict with the City's goals of expanding its economic base and providing greater economic opportunity to the City's residents. **(DEIR at 6-9)**.

Finding: Based on the entire record, the City finds that the No Development Alternative would reduce the environmental impacts associated with the Project. However, the

No Development Alternative would not realize any of the Project objectives by maintaining the site in its existing condition without development as an attractive warehouse building and without providing local employment.

5.4.2 Alternative 2: Truck Trailer Parking Alternative

Under the Truck Trailer Parking Alternative, the Project site would be developed as an approximately 40-acre trailer truck and truck-mounted container storage parking facility. The Project site has a Rialto Airport Specific Plan land use designation of General Manufacturing (I-GM), which permits land uses including wholesale and warehousing operations. Under this alternative scenario, no warehouse uses are assumed. Trucks and trailers would be parked while waiting to be moved to and from off-site locations such as nearby warehouse facilities in instances where there are scheduled delays related to trailer drop off or pick up. The Truck Trailer Parking Alternative would include a one-story, 1,500 sf ancillary free-standing small security office building, 15 passenger vehicle parking stalls for employees, and 960 truck trailer parking spaces. Alternative 2 would represent a reduction of 663,359 sf of building area compared to the proposed Project. (**DEIR at 6-10**).

Like the Project, this alternative assumes that the entire Project site would be graded. Therefore, for environmental issues tied to Project site disturbance, they would be the same for the Project and Alternative 2, and therefore, there would be no change in the significance of the potential impacts. This would be the case for the topics of biological resources, cultural resources, geology and soils, hazards and hazardous materials, and tribal cultural resources, which would be mitigated to a less than significant level. Similarly, this would also be the case for hydrology and water quality and mineral resources, which would be less than significant. Neither Alternative 2 nor the Project would result in significant aesthetic impacts. Although the building square footage associated with Alternative 2 would decrease, the remaining Project site area would be developed with truck trailer parking and site landscaping. With respect to traffic, Alternative 2 is expected to result in an increase in average daily trips compared to the Project. Alternative 2 would likely result in greater VMT impacts than the proposed Project. Alternative 2 assumes the construction of a facility that is 663,359 sf smaller than the proposed Project. Therefore, a shorter construction schedule, a less intensive site preparation and grading phase of construction, and the use of less construction materials and equipment is anticipated. Accordingly, construction air quality emissions, GHG emissions, energy usage and noise levels would be lower than the proposed Project. However, the increase in average daily trips associated with Alternative 2 would likely result in greater operational air quality emissions, energy usage, GHG emissions, and noise impacts. As with the proposed Project, energy usage impacts would be less than significant, air quality emissions and noise impacts would still be less than significant with mitigation incorporated, and GHG emission impacts would be significant and unavoidable despite implementation of mitigation.

Alternative 2 would fail to develop and operate a warehouse that maximizes efficient use of a vacant and underutilized site that is near available infrastructure, major freeways, and other industrial developments as set forth in Project Objectives 1 through 5. Alternative 2 would provide infrastructure improvements and would provide expanded economic activity to the City and would also provide additional employment opportunities. This alternative would still contribute to the City's goal of positively contributing to the economy through new capital investment, expansion

of the tax base, and creation of new employment opportunities but to a lesser degree than the proposed Project. (**DEIR at 6-14 to 6-15**).

Finding: This alternative would meet some of the Project objectives. However, it would not reduce or avoid any of the significant and unavoidable impacts that would occur under the Project, and may in fact result in worsened transportation impacts due to increased trip generation, as well as corresponding increases in operational air quality emissions, energy usage, GHG emissions, and noise impacts. Therefore, the Truck Trailer Parking Alternative is rejected as infeasible.

5.4.3 Alternative 3: Business Park Alternative

Under the Business Park Alternative, the Project site would be developed as a 667,000-sf business park consisting of multi-tenant, free-standing small buildings with office/commercial-related uses. The Business Park Alternative would accommodate a variety of uses including commercial, flexible office space, meeting rooms, or event space. The buildings would be one story and building height would be consistent with development standards included in the Rialto Airport Specific Plan. Under the Business Park Alternative scenario, no warehouse uses are assumed. Therefore, no truck trailer parking would be provided, and individual buildings would not have dock doors for large trucks. All employee and visitor parking would be provided on the Project site, with 2,224 passenger vehicle parking stalls assumed to be provided for employees. The parking requirements for the Rialto Airport Specific Plan are based on the Municipal Code and would be calculated for administrative/office uses. Alternative 3 would result in an increase of 1,859 passenger vehicle parking spaces and a reduction of 398 truck trailer parking spaces when compared to the proposed Project. (**DEIR at 6-15**).

The Project site has a General Plan land use designation of General Industrial and has a Rialto Airport Specific Plan land use designation of I-GM. Under this alternative scenario, a General Plan Amendment to Business Park would be required. Table 8 of the Rialto Airport Specific Plan identifies permitted uses within the I-GM land use designation, including manufacturing and processing, warehousing and distribution, chemical or petroleum products processing and refining, heavy equipment operations, and similar uses. A business park is not a permitted use or a conditionally permitted use in the I-GM land use designation. Business and commercial uses are permitted under several Specific Plan land use designations including Office/Freeway Commercial (O/FC), Airport-Related Planned Industrial Development (I-AR). Therefore, Alternative 3 would require additional discretionary permits/approvals including a Specific Plan Amendment to allow for the development of a business park on the Project site. (**DEIR at 6-16**).

As with the proposed Project, energy usage impacts would be less than significant, air quality emissions and noise impacts would still be less than significant with mitigation incorporated, and GHG emission impacts would be significant and unavoidable despite implementation of mitigation. (**DEIR at 6-21**). This is because Alternative 3 would result in an increase in average daily trips compared to the proposed Project. Alternative 3 would generate 8,297 daily trips when compared to the 1,138 daily trips, including 455 truck trips (1,908 daily PCE trips) for the proposed Project. As such, Alternative 3 would result in greater GHG emissions compared to the Project during operations. (**DEIR at 6-17**).

Alternative 3 would fail to develop and operate a warehouse that maximizes efficient use of a vacant and underutilized site that is zoned for industrial uses and that is near available infrastructure, major freeways, and other industrial developments. Alternative 3 fails to meet most of the Project's basic objectives because Alternative 3 does not propose a warehouse, which is the Applicant's proposed use for the Project site and in conformance with existing zoning. Development of the site as a business park would require a General Plan Amendment and Specific Plan Amendment. However, Alternative 3 would provide expanded economic activity to the City and would also provide additional employment opportunities. This alternative would also provide infrastructure improvements including street and sidewalk improvements, undergrounding of existing utilities, and drainage and water quality treatment improvements on Lowell Street and Locust Avenue similar to the Project. Alternative 3 would also not conflict with the City's goals of expanding its economic base and providing greater economic opportunity to the City's residents. This alternative would still contribute to the City's goal of positively contributing to the economy through new capital investment, expansion of the tax base and creation of new employment opportunities.(**DEIR at 6-20 to 6-21**).

Finding: This alternative would meet some of the Project objectives. This alternative would result in similar impacts compared to the Project, although it would not avoid the significant and unavoidable GHG emissions impact; in fact, GHG emissions under Alternative 3 would be proportionally greater than the proposed Project due to the increased average daily trips. Because this alternative would not meet the Project objectives and would exacerbate the significant and unavoidable GHG impact that would occur under the proposed Project, the Business Park Alternative is rejected as infeasible.

5.4.4 Alternative 4: Reduced Warehouse Alternative

The proposed Project would result in significant unavoidable GHG emissions. To reduce GHG impacts to a less than significant level, Alternative 4 would reduce the proposed warehouse size by approximately 71 percent, which is equivalent to a 193,220-sf warehouse with 4 dock doors and 137 passenger vehicle parking spaces. Like the proposed Project, Alternative 4 would have 398 truck trailer parking spaces. Alternative 4 would result in a reduction of 471,639 sf of building area when compared to the proposed Project. The implementation of Alternative 4 would not use the entire 40-acre Project site. This alternative assumes the truck trailer parking in the same location as assumed for the proposed Project. When compared to the proposed Project site plan, approximately one-half or more of the warehouse site (the southern portion of the site) would not be developed and would remain vacant. (**DEIR at 6-21**).

For environmental issues where Project site disturbance would be the same for the proposed Project and Alternative 4, there would be no change in the significance of potential impacts. This would be the case for the topics of biological resources, cultural resources, geology and soils, hazards and hazardous materials, and tribal cultural resources which would be mitigated to a less than significant level. Similarly, this would also be the case for hydrology and water quality and mineral resources, which would be less than significant. Neither Alternative 4 nor the Project would result in significant aesthetic impacts. Although the building square footage associated with

Alternative 4 would decrease and parking and landscaping would be provided, the southern portion of the Project site would not be developed and would remain vacant. With respect to traffic, Alternative 4 would result in a decrease in average daily trips and would result in lower VMT impacts than the proposed Project. Therefore, like the proposed Project, transportation impacts from Alternative 4 would be less than significant. The reduction in square footage and average daily trips of Alternative 4 would likely result in lower air quality emissions, energy usage, GHG emissions, and noise impacts. A shorter construction schedule, a less intensive site preparation and grading phase of construction, and the use of less construction materials and equipment is anticipated. Accordingly, construction air quality emissions, GHG emissions, energy usage and noise levels would be lower than the proposed Project. Further, the reduction in average daily trips associated with Alternative 4 would reduce operational air quality emissions, energy usage, GHG emissions, and noise impacts. As with the proposed Project, energy usage impacts would be less than significant and air quality emissions and noise impacts would still be less than significant with mitigation incorporated. Under Alternative 4, GHG emissions would be reduced to a less than significant level, while the proposed Project would result in a significant and unavoidable impact. (**DEIR at 6-26**).

Among the factors that may be taken into account when addressing the feasibility of alternatives are attaining project objectives, site suitability and economic viability. Alternative 4 would not meet Project Objective 2 because the construction of a 193,200-sf warehouse, which is more than 71 percent smaller than the proposed Project on less than half of the 40-acre site, does not maximize "the efficient use of a vacant and underutilized and environmentally constrained site." Further, Alternative 4 would not meet Project Objective 5 because a substantially smaller warehouse would have a different tenant base than would be associated with the size of the proposed Project; it may not be "an attractive development" that would "attract quality tenants" and "be competitive with other similar facilities in the region." The significant reduction in total square footage presented in Alternative 4 is of a magnitude that is sufficiently severe as to render this alternative impractical. Furthermore, Alternative 4 would not generate adequate income to cover the carrying costs necessary to cover the taxes and related expenses. Finally, Alternative 4 would not qualify for the necessary financing to develop because of the low returns on investment based on the limited size of the facility and the high costs of remediating and developing on an environmentally contaminated site. Based on the significantly reduced scope, Alternative 4 only partially meets the remaining Project Objectives. Alternative 4 would provide infrastructure improvements including street and sidewalk improvements, undergrounding of existing utilities, and drainage and water quality treatment improvements on Lowell Street and Locust Avenue, but potentially reduced in scale due to the smaller warehouse and development footprint. Additionally, the Reduced Warehouse Alternative would provide expanded economic activity to the City and provide additional employment opportunities, but to a substantially lesser degree than the proposed Project because it would be approximately 71 percent smaller. Alternative 4 would not conflict with the City's goals of expanding its economic base and providing greater economic opportunity to the City's residents, but it would do so to a lesser degree than the proposed Project due to the reduced scale of the warehouse. (**DEIR at 6-25 to 6-26**).

Finding: This alternative would partially meet some of the Project objectives and would avoid the significant and unavoidable GHG emissions impact. However, because the reduced size of this alternative would not meet all of the project objectives,

maximize the productivity of the site and have limited economic viability, the Reduced Warehouse Alternative is rejected as infeasible.

5.4.5 Environmentally Superior Alternative

Based on the summary of information presented in **Draft EIR Table 6-4, Summary of Proposed Project and Alternatives Impacts,** the environmentally superior alternative is Alternative 1: No Development Alternative. Because Alternative 1 would leave the Project site unchanged and would not have the construction or operational impacts that would be associated with the Project, Alternative 1 would avoid all impacts as compared to the Project or any of the other alternatives.

CEQA Guidelines Section 15126.6(e)(2) states that if a "no project" alternative is found to be environmentally superior, "the EIR shall also identify an environmentally superior alternative among the other alternatives." Aside from the No Development Alternative, Alternative 4: Reduced Warehouse Alternative would have the least environmental impacts because it would incrementally reduce all impacts and avoid the significant and unavoidable GHG impact that would occur under the proposed Project.

However, while the Reduced Warehouse Alternative is the environmentally superior alternative, it would fail to meet two Project objectives and only partially meets the remaining Project objectives. (**DEIR at 6-29 to 6-30**).

6.0 STATEMENT OF OVERRIDING CONSIDERATIONS

CEQA and the CEQA Guidelines Section 15093 provide, in part, the following:

(a) CEQA requires the decision-making agency to balance, as applicable, the economic, legal, social, technological, or other benefits, including region-wide or statewide environmental benefits, of a proposed project against its unavoidable environmental risks when determining whether to approve the project. If the specific economic, legal, social, technological, or other benefits, including region-wide or statewide environmental benefits, of a proposed project outweigh the unavoidable adverse environmental effects, the adverse environmental effects may be considered "acceptable."

(b) When the lead agency approves a project which will result in the occurrence of significant effects which are identified in the final EIR but are not avoided or substantially lessened, the agency shall state in writing the specific reasons to support its action based on the final EIR and/or other information in the record. The statement of overriding considerations shall be supported by substantial evidence in the record.

(c) If an agency makes a statement of overriding considerations, the statement should be included in the record of the project approval and should be mentioned in the Notice of

Determination. This statement does not substitute for, and shall be in addition to, findings required pursuant to Section 15091.

The City of Rialto, having reviewed and considered the information contained in the Final EIR for the Project, Responses to Comments and the public record, adopts the following Statement of Overriding Considerations that have been balanced against the unavoidable adverse impacts in reaching a decision on this Project.

To the extent that the significant effects of the Project are not avoided or substantially lessened to below a level of significance, the City of Rialto, having reviewed and considered the information contained in the EIR and the public record, and having balanced the benefits of the Project against the unavoidable effects which remain, finds that such unmitigated effects to be acceptable in view of the following overriding considerations. The City finds that any one of these Project benefits standing alone would be sufficient to sustain the Statement of Overriding Considerations:

1. All feasible mitigation measures have been imposed to lessen Project impacts to less than significant levels; and furthermore, alternatives to the Project are infeasible because while they have similar or less environmental impacts, they do not provide the benefits of the Project, or are otherwise socially or economically infeasible when compared to the Project, as described in this Findings of Fact.

2. The Project will provide electric passenger car charging infrastructure.

3. The Project has committed, by way of binding enforceable mitigation, to provide 100 percent of the expected building's energy load from a combination of on-site renewable energy generation such as solar photovoltaic panels and/or renewable energy purchase.

4. The Project will develop a currently vacant and underutilized site that is environmentally constrained due to its location within the former bunker area of the larger Rockets, Fireworks, and Flares Superfund site, and will ensure the careful and thorough removal of any unexploded ordinances and discarded military munitions that may be present on the site prior to development, thus resulting in reduced hazards and increased safety for the surrounding community.

5. The Project will provide infrastructure improvements including street and sidewalk improvements to Lowell Street and Locust Avenue, undergrounding of existing utilities, and drainage and water quality treatment improvements.

6. Construction spending will create a one-time stimulus to the local and regional economies.

7. The Project will enhance the City's fiscal health through increased property taxes, sales taxes, and other local revenue streams. These revenues will support essential public services such as public safety, parks, and infrastructure maintenance.

8. Approval of the Project will create local and regional employment-generating opportunities for citizens of the City and surrounding communities. Specifically, approval of the Project is expected to create approximately 557 new jobs, in addition to temporary construction jobs.

9. The Project would meet the needs of the growing logistics sector and will attract similar business that can expedite the delivery of essential goods to consumers and businesses in the City and region, thereby fostering long-term economic growth.

10. Approval of the project will contribute towards maximizing employment opportunities within the City to improve the jobs-housing balance, typically viewed as housing rich and job poor, which would help to reduce systemic unemployment within the City.

11. The Project is strategically located in close proximity to three major freeways (State Route 210, Interstate 215 and Interstate 15) and the ports of Los Angeles and Long Beach, thereby improving the efficiency of movement of goods and a reduction in vehicle miles traveled.

12. By optimizing goods movement, the Project will indirectly reduce inefficiencies in the transportation system, which benefits local communities through improved access to goods and services.

13. The Project is consistent with, and will contribute to achieving the goals and objectives established by the General Plan. Implementing the City's General Plan as a policy is a legal and social prerogative of the City.

Although only one significant impact remains, the City will mitigate the significant adverse impacts to greenhouse gas emissions to the maximum extent practicable. In its decision to approve the Project, the City has considered the Project benefits to outweigh the one significant and unavoidable environmental impact.

7.0 CERTIFICATION OF FINAL EIR

The City declares that no new significant information as defined by the CEQA Guidelines Section 15088.5, has been received by the City after circulation of the EIR that would require recirculation. The City certifies that the Final EIR was prepared in compliance with CEQA and the CEQA Guidelines and that the City has complied with CEQA's procedural and substantive requirements. The City further certifies that it has reviewed and considered the EIR in evaluation the Project and that the EIR reflects the independent judgment and analysis of the City.

As the decision-making body for approval, the City has reviewed and considered the information contained in the Findings and supporting documentation. The City determines that the Findings contain a complete and accurate reporting of the unavoidable impacts and benefits of the Project as detailed in the Statement of Overriding Considerations.

Accordingly, the City certifies the Final EIR for Project based on the findings and conclusions discussed below.

8.0 FINDINGS

Per Guidelines Section 15091, the Project would have the potential for creating significant adverse impacts. These significant adverse environmental impacts have been identified in the EIR and will require mitigation as set forth in the Findings. However, the Project will have significant adverse impacts even following adoption of all feasible mitigation measures that are required by the City. The following significant environmental impact has been identified in the Final EIR and will require mitigation but cannot be mitigated to a level of insignificance:

Greenhouse Gas Significant Unavoidable Impact

After mitigation, the Project would still exceed the applied threshold of 3,000 MT CO_2e per year, at approximately 10,172 $MTCO_2e$. No feasible mitigation measures exist beyond those already identified that would reduce these emissions to levels that are less than significant. Therefore, even with the incorporation of mitigation, long-term impacts associated with a cumulatively considerable increase in GHG emissions would be significant and unavoidable.

Conclusions

1. Except as to GHG emissions, all other potentially significant Project-level and cumulative environmental impacts from the implementation of the proposed Project have been identified in the EIR and, with implementation of the mitigation measures identified, will be mitigated to less than significant.

2. The No Development, Truck Trailer Parking, Business Park and Reduced Warehouse Alternatives have been considered and rejected in favor of the proposed Project.

3. Environmental, economic, social, and other considerations and benefits derived from the development of the Project override and make infeasible any alternatives to the Project or further mitigation measures beyond those incorporated into the Project.

9.0 ADOPTION OF MITIGATION MONITORING AND REPORTING PROGRAM

Pursuant to Public Resources Code Section 21081.6, the City hereby adopts, as conditions of approval of the Project, the Mitigation Monitoring and Reporting Plan (MMRP) provided as Exhibit B within this Resolution. In the event of any inconsistencies between the mitigation measures set forth herein and the attached MMRP, the MMRP shall control, except to the extent that a mitigation measure contained herein is inadvertently omitted from the MMRP, in which case such mitigation measure shall be deemed as if it were included in the MMRP.

END OF EXHIBIT A

EXHIBIT B

MITIGATION MONITORING & REPORTING PROGRAM

[See Following Pages]

4.0 MITIGATION MONITORING AND REPORTING PROGRAM

4.1 PURPOSE OF MITIGATION MONITORING AND REPORTING PROGRAM

The California Environmental Quality Act (CEQA) requires that all public agencies establish monitoring and/or reporting procedures for mitigation adopted as conditions of approval in order to mitigate or avoid significant environmental impacts. This Mitigation Monitoring and Reporting Program (MMRP) has been developed to provide a vehicle by which to monitor the Mitigation Program outlined in the Locust Gateway Development Project Final Environmental Impact Report (EIR), State Clearinghouse No. 2024061274. The MMRP has been prepared in conformance with Section 21081.6 of the Public Resources Code. Specifically, Section 21081.6 states:

> (a) When making findings required by paragraph (1) of subdivision (a) of Section 21081 or when adopting a mitigated negative declaration pursuant to paragraph (2) of subdivision (c) of Section 21080, the following requirements shall apply:
>
> (1) The public agency shall adopt a reporting or monitoring program for the changes made to the project or conditions of project approval, adopted in order to mitigate or avoid significant effects on the environment. The reporting or monitoring program shall be designed to ensure compliance during project implementation. For those changes which have been required or incorporated into the project at the request of a responsible agency or a public agency having jurisdiction by law over natural resources affected by the project, that agency shall, if so requested by the lead or responsible agency, prepare and submit a proposed reporting or monitoring program.
>
> (2) The lead agency shall specify the location and custodian of the documents or other material which constitute the record of proceedings upon which its decision is based.

CEQA Guidelines Section 15097 provides clarification of mitigation monitoring and reporting requirements and guidance to local lead agencies on implementing strategies. The reporting or monitoring program must be designed to ensure compliance during project implementation. The City of Rialto is the Lead Agency for the Project and is therefore responsible for ensuring the implementation of the MMRP. The MMRP has been drafted to meet the requirements of Public Resources Code Section 21081.6 as a fully enforceable monitoring program.

4.2 ORGANIZATION

The Mitigation Program identified in the EIR outlines the standard conditions of approval and mitigation measures for which implementation of the Project would be consistent with.

The MMRP defines the following for each Mitigation Program element:

- **Definition.** The Mitigation Program element contains the criteria for mitigation, either in the form of adherence to certain adopted regulations or identification of the steps to be taken in mitigation.

- **Time Frame.** In each case, a time frame is provided for performance of the mitigation or the review of evidence that mitigation has taken place. The performance points selected are designed to ensure that impact-related components of Project implementation do not proceed without establishing that the mitigation is implemented or ensured. All activities are subject to the approval of all required permits from agencies with permitting authority over the specific activity.
- **Monitoring/Reporting Method.** The actions required to ensure the measure is implemented are noted.
- **Responsible Party or Designated Representative.** Unless otherwise indicated, an applicant would be the party responsible for implementing the mitigation, and the City of Rialto or designated representative would be responsible for monitoring the performance and implementation of the mitigation measure. To guarantee that the mitigation will not be inadvertently overlooked, a supervising public official acting as the Designated Representative is the official who grants the permit or authorization called for in the performance. Where more than one official is identified, permits or authorization from all officials shall be required.

The last column of the MMRP table will be used by the parties responsible for documenting when implementation of the measure has been completed. The ongoing documentation and monitoring of mitigation compliance will be completed by the City of Rialto. The completed MMRP and supplemental documents will be kept on file at the City of Rialto Community Development Department.

Air Quality					
Laws, Ordinances, and Regulations (LORs) are existing requirements that are based on local, State, or federal regulations or laws that are frequently required independently of CEQA review. **LOR AQ-1.** Prior to the issuance of grading permits, the City Engineer shall confirm that the Grading Plan, Building Plans and Specifications require all construction contractors to comply with South Coast Air Quality Management District's (SCAQMD) Rules 402 and 403 to minimize construction emissions of dust and particulates. The measures include, but are not limited to, the following: ▪ Portions of a construction site to remain inactive longer than a period of three months will be seeded and watered until grass cover is grown or otherwise stabilized. ▪ All on-site roads will be paved as soon as feasible or watered periodically or chemically stabilized. ▪ All material transported off site will be either sufficiently watered or securely covered to prevent excessive amounts of dust. ▪ The area disturbed by clearing, grading, earthmoving, or excavation operations will be minimized at all times. ▪ Where vehicles leave a construction site and enter adjacent public streets, the streets will be swept daily or washed down at the end of the workday to remove soil tracked onto the paved surface.	Prior to the issuance of grading permits	On-site inspections	City of Rialto Public Works Department, Engineering Services		
LOR AQ-2. Require diesel powered construction equipment to turn off when not in use per Title 13 of the California Code of Regulations, Section 2449.	Ongoing during construction	On-site inspections	City of Rialto Public Works Department, Engineering Services		
LOR AQ-3. Install water-efficient irrigation systems and devices, such as soil moisture-based irrigation controls and sensors for landscaping according to the City's Water Efficient Landscape requirements (Chapter 12.50 of the City's Municipal Code).	Prior to Issuance of Occupancy Permit	Documentation of Low Water Use Landscaping	City of Rialto Community Development Department, Planning Division		
LOR AQ-4. In accordance with California Title 24 Standards, buildings will be designed to have 15 percent of the roof area "solar ready" that will structurally accommodate later installation of rooftop solar panels. If future building operators pursue providing rooftop solar panels, they will submit plans for solar panels prior to occupancy.	Condition of issuance of Building Permit	On-site inspections	City of Rialto Community Development Department, Building and Safety Division

Standard Conditions; Mitigation Measures; Laws, Ordinances and Regulations	**Implementation Timing**	**Monitoring/Reporting Method**	**Responsible Party for Implementation/ Approval**	**Verification**	
				Date	**Initials**
LOR AQ-5. The Project shall be designed in accordance with the applicable California Green Building Standards (CALGreen) Code (24 CCR, Part 11). The Building Official, or designee shall ensure compliance prior to the issuance of each building permit. These requirements include, but are not limited to: ▪ Design buildings to be water efficient. Install water-efficient fixtures in accordance with Section 5.303 of the California Green Building Standards Code Part 11. ▪ Recycle and/or salvage for reuse a minimum of 65 percent of the nonhazardous construction and demolition waste in accordance with Section 5.408.1 of the California Green Building Standards Code Part 11. ▪ Provide storage areas for recyclables and green waste and adequate recycling containers located in readily accessible areas in accordance with Section 5.410 of the California Green Building Standards Code Part 11. ▪ To facilitate future installation of electric vehicle supply equipment (EVSE), nonresidential construction shall comply with Section 5.106.5.3 (nonresidential electric vehicle charging) of the California Green Building Standards Code Part 11.	Condition of issuance of Building Permit Prior to issuance of Occupancy Permit	On-site inspections	City of Rialto Community Development Department, Building and Safety Division		
MM AQ-1: Low VOC Paints. The Project shall use "Super-Compliant" low VOC paints which have been reformulated to exceed the regulatory VOC limits (i.e., have a lower VOC content than what is required) put forth by SCAQMD's Rule 1113 for all architectural coatings. Super-Compliant low VOC paints shall be no more than 10 g/L of VOC. Prior to issuance of a building permit, the City shall confirm that plans include the following specifications: ▪ All architectural coatings will be super-compliant low VOC paints. ▪ Recycle leftover paint. Take any leftover paint to a household hazardous waste center; do not mix leftover water-based and oil-based paints. ▪ Keep lids closed on all paint containers when not in use to prevent VOC emissions and excessive odors. ▪ For water-based paints, clean up with water only. Whenever possible, do not rinse the cleanup water down the drain or pour it directly into the ground or the storm drain. Set aside the can of cleanup water and take it to the hazardous waste center (www.cleanup.org). ▪ Use compliant low-VOC cleaning solvents to clean paint application equipment.	Prior to issuance of a Building Permit	Confirm compliance during on-site inspections	City of Rialto Community Development Department, Building and Safety Division		

Locust Gateway Development Project Mitigation Monitoring and Reporting Program					
Standard Conditions; Mitigation Measures; Laws, Ordinances and Regulations	**Implementation Timing**	**Monitoring/Reporting Method**	**Responsible Party for Implementation/ Approval**	**Verification**	
				Date	**Initials**
▪ Keep all paint- and solvent-laden rags in sealed containers to prevent VOC emissions. ▪ Contractors shall construct/build with materials that do not require painting and use pre-painted construction materials to the extent practicable. ▪ Use high-pressure/low-volume paint applicators with a minimum transfer efficiency of at least 50 percent or other application techniques with equivalent or higher transfer efficiency.					
MM AQ-2: Require All-Electric Development. Prior to the issuance of building permits, the Building Department shall confirm that building plans require the Project to use all-electric appliances, and end uses instead of natural gas. The Project shall not include natural gas utility lines or connections. The purpose of this mitigation measure is to reduce air quality emissions from natural gas.	Prior to the issuance of Building Permits	Approval of Plans and Specifications	City of Rialto Community Development Department, Building and Safety Division		
MM AQ-3: Electric Landscape Equipment. Prior to the issuance of occupancy permits, the Planning Division shall confirm that the Project's Covenants, Conditions and Restrictions (CC&Rs) and/or tenant lease agreements include contractual language that all handheld landscaping equipment used on site shall be 100 percent electrically powered. The logistics warehouse and parking lots shall be equipped with exterior electrical outlets to accommodate this requirement. This requirement shall be included in the third-party vendor agreements for landscape services for the building owner and tenants, as applicable. This mitigation measure applies only to tenant improvements and not the building shell approvals.	Prior to the issuance of Occupancy Permits	Approval of Plans and Specifications	City of Rialto Community Development Department, Planning Division		
MM AQ-4: Transportation Demand Management: Prior to issuance of tenant occupancy permits, the tenant/facility operator shall prepare and submit a Transportation Demand Management (TDM) program detailing strategies that would reduce the use of single occupant vehicles by employees by increasing the number of trips by walking, bicycle, carpool, vanpool and transit. The TDM shall include measures such as, but not limited to the following: ▪ Provide a transportation information center and on-site TDM coordinator to educate residents, employers, employees, and visitors of surrounding transportation options.	Prior to the issuance of tenant occupancy permits.	Approval of Plans and Specifications	Tenant/Facility Operator

Standard Conditions; Mitigation Measures; Laws, Ordinances and Regulations	**Implementation Timing**	**Monitoring/Reporting Method**	**Responsible Party for Implementation/ Approval**	**Verification**	
				Date	**Initials**
▪ Promote bicycling and walking through design features such as showers for employees, self-service bicycle repair area, etc. around the Project site. ▪ Each building shall provide secure bicycle storage space equivalent to two percent of the automobile parking spaces provided. ▪ Each building shall provide a minimum of two shower and changing facilities as part of the tenant improvements. ▪ Provide on-site car share amenities for employees who make only occasional use of a vehicle, as well as others who would like occasional access to a vehicle of a different type than they use day-to-day. ▪ Promote and support carpool/vanpool/rideshare use through parking incentives and administrative support, such as ride-matching service. ▪ Incorporate incentives for using alternative travel modes, such as preferential load/unload areas or convenient designated parking spaces for carpool/vanpool users. ▪ Provide meal options on site or shuttles between the facility and nearby meal destinations. ▪ Each building shall provide preferred parking for electric, low-emitting and fuel-efficient vehicles equivalent to at least eight percent of the required number of parking spaces. ▪ This mitigation measure applies only to tenant occupancy and not the building shell approvals.					
MM AQ-5: Non-Diesel Cargo Handling Equipment. The warehouse building shall include the necessary charging stations for cargo handling equipment. Prior to the issuance of a tenant occupancy permit, the Planning Division shall confirm that the Project plans and specifications show that all outdoor cargo handling equipment (including yard trucks, hostlers, yard goats, pallet jacks, and forklifts) are zero emission or alternatively fueled (i.e., powered by electricity or non-diesel fuels). The building manager or their designee shall be responsible for enforcing these requirements. Note that SCAQMD Rule 2305 (Warehouse Indirect Source Rule) Warehouse Actions and Investments to Reduce Emissions (WAIRE) points may be earned for electric/zero emission yard truck/hostler usage. This mitigation measure applies only to tenant improvements and not the building shell approvals.	Prior to the issuance of tenant occupancy permits.	Approval of Plans and Specifications	City of Rialto Community Development Department, Planning Division

				Date	**Initials**
Biological Resources					
MM BIO-1: Rare Plant Mitigation Plan. Parry's spineflower (CRPR 1B.1) is present on site and impacts are unavoidable; therefore, compensatory mitigation shall be provided to offset impacts. A rare plant mitigation plan shall be prepared and implemented by the applicant or its designee prior to the onset of grading activities. The plan will demonstrate the feasibility of conserving, enhancing, or restoring Parry's spineflower habitat in areas to be managed as natural open space without conflicting with other resource management objectives. Habitat conservation, enhancement, or restoration will be at a minimum 1:1 ratio (acres conserved, enhanced, or restored to acres impacted). If the rare plant mitigation plan proposes conservation of an extant population, the plan shall include at a minimum: (a) the location of the conserved habitat and an analysis of its suitability as compensatory mitigation; (b) an assessment of the extant Parry's spineflower populations at the proposed conservation site; (c) a long-term management plan which includes objectives, management practices, monitoring protocols, adaptive management strategies, and reporting requirements; and (d) details regarding the establishment of a non-wasting endowment to perpetually fund management of the conserved land, or such other funding mechanism acceptable to CDFW. If the rare plant mitigation plan proposes enhancement or restoration, the plan shall include at minimum: (a) collection/salvage measures for plants or seed banks, to retain intact soil conditions and maximize success likelihood; (b) details regarding storage of plants or seed banks; (c) location of the proposed recipient site, and detailed site preparation and plant introduction techniques details for top soil storage, as applicable; (d) time of year that the salvage and replanting or seeding will occur and the methodology of the replanting; (e) a description of the irrigation, if used; (f) success criteria; and (g) a detailed monitoring program, commensurate with the plan's goals.	Prior to the onset of grading activities.	Verify Pre-Construction Surveys Conducted. Field Inspection signoff, and compliance report by Qualified Biologist.	Qualified Biologist City of Rialto Community Development Department, Planning Division		
MM BIO-2: Best Management Practices. To avoid impacts to special-status resources and inadvertent disturbance, the following monitoring requirements and Best Management Practices (BMPs) shall be implemented:	Prior to initial ground disturbing activities. Ongoing during grading and construction	Verify Pre-Construction Surveys Conducted. Field Inspection signoff, and	Qualified Biologist		

Locust Gateway Development Project Mitigation Monitoring and Reporting Program					
Standard Conditions; Mitigation Measures; Laws, Ordinances and Regulations	**Implementation Timing**	**Monitoring/Reporting Method**	**Responsible Party for Implementation/ Approval**	**Verification**	
				Date	**Initials**
a. Construction vehicles shall not exceed 15 miles per hour on unpaved roads adjacent to the project site or the right-of-way accessing the site. b. The Applicant, or its contractors, shall screen, cover, or elevate at least one foot above ground, all construction pipe, culverts, or similar structures with a diameter of three inches or greater that are stored on site overnight. These pipes, culverts, and similar structures shall be inspected by the Project biologist for wildlife before such material is moved, buried, or capped. c. Construction activities shall occur during daytime hours to the greatest extent feasible. If construction must occur at nighttime, lights shall be oriented in such a way that they direct light downward and toward the active construction, ensuring that no direct light is emitted towards adjacent lands, and shields or deflectors shall be installed on lights to reduce light spill. Nighttime concrete pouring shall be performed in accordance with the City of Rialto Municipal Code. d. A biologist shall flush special-status species (i.e., avian or other mobile species), with the exception of burrowing owls, from suitable habitat areas within the Project development footprint to the maximum extent practicable immediately (e.g., within 24 hours) prior to initial vegetation removal activities. The biologist shall flush wildlife by walking through habitats to be imminently removed and towards adjacent open space. e. At the end of each workday during construction, the applicant, or its contractors, shall cover all excavated, steep-sided holes or trenches more than eight inches deep and that have sidewalls steeper than 1:1 (45 degree) slope with plywood or similar materials, or provide a minimum of one escape ramp per 100 feet of trenching (with slopes no greater than 3:1) constructed of earth fill or wooden planks. The applicant, or its contractors shall thoroughly inspect holes and trenches for trapped animals each workday. f. Contractors shall not permit pets on the construction site. g. If trash and debris need to be stored overnight during maintenance activities, fully covered trash receptacles that are animal-proof and weather-proof shall be used by the maintenance contractor to contain all food, food scraps, food wrappers, beverage containers, and other miscellaneous trash. Alternatively, standard trash		compliance report by Qualified Biologist.	City of Rialto Community Development Department, Planning Division

				Date	**Initials**
receptacles may be used during the day but must be removed or emptied each night. h. To prevent inadvertent disturbance to areas outside the limits of work, the construction limits shall be clearly demarcated (e.g., installation of flagging or temporary visibility construction fence) prior to ground-disturbance activities, and all construction activities, including equipment staging and maintenance, shall be conducted within the marked disturbance limits. The work limit delineation shall be maintained throughout Project construction. i. The Applicant, or its contractors, shall avoid the use of invasive plant species in the associated landscaping. j. Prior to initial ground disturbing activities, a Worker Environmental Awareness Program (WEAP) shall be prepared, which will include a training presentation and key fact sheet. The training will instruct construction crews to be aware of and recognize sensitive biological resources that may be encountered within, or adjacent to, the project site. The training will provide workers with instructions to follow in the event a sensitive species is observed or suspected to be on site. Biologists shall provide WEAP training materials, including but not limited to the key fact sheet, to construction personnel before their commencement of work on the Project. Additionally, all construction staff shall attend the WEAP training presentation prior to beginning work on site. Upon completion of the WEAP training, each member of the construction crew shall sign a form stating that they attended the training, understood the information presented, and agreed to comply with the requirements set out in the WEAP training. Biologists shall provide updates relevant to the training to construction personnel during the safety ("tailgate") meetings, as needed.					
MM BIO-3A: Burrowing Owl Preconstruction Surveys. No less than 14 days prior to the onset of construction activities, a qualified biologist shall survey the construction limits of the project site and a 500-foot buffer for the presence of burrowing owls and occupied nest burrows. A second survey shall be conducted within 24 hours prior to the onset of construction activities. Time lapses between Project activities greater than one week (7 days) would trigger subsequent 24-hour take avoidance surveys to confirm burrowing owl absence. The surveys shall be conducted in accordance with	Preconstruction survey conducted no less than 14 days prior to the onset of construction activities Second survey conducted within 24 hours prior to the onset of construction activities.	Verify Pre-Construction Surveys Conducted. Field Inspection signoff, and compliance report by Qualified Biologist.	Qualified Biologist City of Rialto Community Development Department, Planning Division

				Date	**Initials**
the most current CDFW survey methods. If burrowing owls are not observed during clearance surveys or biological monitoring, no additional conditions are required to avoid impacts to burrowing owls. The Project Applicant shall submit at least one burrowing owl pre-construction survey report to the satisfaction of the City to document compliance with this mitigation measure. For the purposes of this measure, 'qualified biologist' is a biologist who meets the requirements set forth in the BUOW Guidelines (CDFW 2012).					
MM BIO-3B: Burrowing Owl Plan or CESA ITP. If burrowing owls, active burrows, or signs thereof are confirmed during any survey or biological monitoring, Project activities with the potential to impact burrowing owls shall be immediately halted. The qualified biologist shall coordinate with CDFW and prepare a Burrowing Owl Plan that shall be submitted to CDFW for review and approval prior to commencing on-site grading with the potential to impact burrowing owl. The Burrowing Owl Plan shall describe proposed avoidance, and monitoring actions. The Burrowing Owl Plan shall include the number and location of occupied burrow sites, acres of burrowing owl habitat that will be impacted, details of site monitoring, and details on proposed buffers and other avoidance measures if avoidance is proposed. Project activities with the potential to impact burrowing owls shall not occur within 500 feet of an active burrow until CDFW approves the Burrowing Owl Plan. If Project activities, including occupied burrow exclusion and closure, could result in take of burrowing owl, the applicant shall coordinate with CDFW for appropriate CESA authorization (i.e., ITP under CFGC section 2081) prior to commencement of on-site grading with the potential to impact burrowing owl. The ITP shall describe, at a minimum, Project activities and equipment, proposed avoidance/buffers, temporary and permanent impacts, monitoring, relocation and/or translocation, and minimization and compensatory mitigation actions. ITP compensatory mitigation will be fulfilled by one or more of following options: 1) purchase of credits at a CDFW-approved conservation or mitigation bank (if available); 2) execution of a Mitigation Credit Agreement; or 3) Permittee-responsible mitigation land acquisition. The conditions of the permit or measures outlined in the plan shall be adhered to by the applicant and any required compensatory mitigation of habitat would be provided.	If burrowing owls are detected during preconstruction surveys	Preparation of Burrowing Owl Plan, if burrowing owls are detected	City of Rialto Community Development Department, Planning Division California Department of Fish and Wildlife (CDFW) Qualified Biologist

				Date	**Initials**
MM BIO-4A: Crotch's Bumble Bee Surveys. At a minimum, two pre-construction nesting surveys shall be conducted prior to Project implementation. Surveys shall occur within 1) one week; and 2) within 24-hours prior to any vegetation removal or ground-disturbing activities scheduled to occur during the Crotch's bumble bee flight season (February through October). Surveys shall follow the guidelines provided in the CDFW's *Survey Considerations for CESA Candidate Bumble Bee Species* (2024b) and shall occur within the project site and areas adjacent to the project site where suitable habitat exists. The surveyors shall be qualified biologists familiar with Crotch's bumble bee identification and life history.	Two pre-construction nesting surveys shall be conducted prior to Project implementation. 1) one week; and 2) within 24-hours prior to any vegetation removal or ground-disturbing activities scheduled to occur during the Crotch's bumble bee flight season (February through October)	Verify Pre-Construction Surveys Conducted. Field Inspection signoff, and compliance report by Qualified Biologist	Qualified Biologist City of Rialto Community Development Department, Planning Division		
MM BIO-4B: Crotch's Bumble Bee CESA ITP. Suitable Crotch's bumble bee habitat and Crotch's bumble bee presence has been confirmed on the site; therefore, a CESA ITP shall be applied for and obtained prior to the commencement of on-site grading with the potential to impact Crotch's bumble bee. The ITP shall include, at a minimum, a description of Project activities and equipment, proposed avoidance/buffers, identification of temporary and permanent impacts, monitoring requirements, relocation and/or translocation protocols, and compensatory mitigation measures. Compensatory mitigation will be at a minimum 1:1 ratio (acres conserved, enhanced, or restored to acres impacted). ITP compensatory mitigation shall be satisfied by one or more of the following mechanisms: 1) purchase of credits at a CDFW-approved conservation or mitigation bank (if available); 2) execution of a Mitigation Credit Agreement; or 3) Permittee-responsible mitigation land acquisition.	CESA ITP shall be applied for and obtained prior to the commencement of on-site grading.	Verify Pre-Construction Surveys Conducted. Field Inspection signoff, and compliance report by Qualified Biologist	City of Rialto Community Development Department, Planning Division California Department of Fish and Wildlife (CDFW) Qualified Biologist		
MM BIO-4C: Crotch's Bumble Bee Biological Monitor. A qualified biological monitor shall conduct full-time monitoring during removal of suitable nectar plants that is scheduled to occur during the queen flight period (February through March), colony active period (April through August), and/or gyne flight period (September through October). The monitor shall have authority to temporarily halt or redirect activities as needed to avoid unauthorized impacts.	Ongoing during removal of suitable nectar plants if conducted February through March, April through August, and/or September through October.	Verify Pre-Construction Surveys Conducted. Field Inspection signoff, and compliance report by Qualified Biologist	Qualified Biologist City of Rialto Community Development Department, Planning Division		
MM BIO-5A: Nesting Bird Surveys. To ensure compliance with California Fish and Game Code Sections 3503, 3503.5, and 3513 and to avoid potential impacts to nesting birds, vegetation clearing and ground-disturbing activities shall be conducted outside of the bird nesting season (generally February 15 through August 31), if feasible.	Prior to vegetation clearing and ground-disturbing activities Nesting bird survey within three (3) days prior to any disturbance of the site.	Verify Pre-Construction Surveys Conducted. Field Inspection signoff, and	Qualified Biologist City of Rialto Community Development Department, Planning Division		

Locust Gateway Development Project Mitigation Monitoring and Reporting Program					
Standard Conditions; Mitigation Measures; Laws, Ordinances and Regulations	**Implementation Timing**	**Monitoring/Reporting Method**	**Responsible Party for Implementation/ Approval**	**Verification**

Regardless of the time of year, a qualified biologist shall conduct a nesting bird survey within three (3) days prior to any disturbance of the site, including but not limited to vegetation clearing, disking, demolition activities, staging, or grading.		compliance report by Qualified Biologist			
MM BIO-5B: Nesting Bird Surveys. If active nests are identified, the biologist shall establish suitable buffers around the nests depending on the level of activity within the buffer and species observed. Buffer areas shall be avoided until the nests are no longer occupied, and the juvenile birds can survive independently from the nests. During construction activities, the qualified biologist shall continue biological monitoring activities at a frequency recommended by the qualified biologist using their best professional judgment. If nesting birds are documented, avoidance and minimization measures may be adjusted and construction activities stopped or redirected by the qualified biologist to avoid take of nesting birds. If nesting birds are not documented during the pre-construction survey, adherence to additional measures may not be necessary to avoid impacts to nesting birds.	Pre-construction nesting bird survey. Biological monitoring ongoing during construction.	Verify Pre-Construction Surveys Conducted. Field Inspection signoff, and compliance report by Qualified Biologist	Qualified Biologist City of Rialto Community Development Department, Planning Division		
MM BIO-6A: Special-Status Preconstruction Lizard Surveys. Within 30 days prior to the commencement of any on-site Project activities, a qualified biologist shall conduct pre-construction surveys in suitable special-status lizard habitat throughout the project site. Project-related activities that would result in ground disturbance include any construction, vegetation removal, equipment and vehicle access, parking, and staging. The qualified biologist shall have familiarity with special-status lizard species as recognized by CDFW. A minimum of one daytime survey during suitable weather for lizard activity shall be conducted by walking linear transects spaced to provide 100 percent coverage of suitable habitat. The location of any observed special-status lizards shall be documented. If feasible, the locations of any special-status lizards shall be avoided. Avoidance measures shall be monitored by the qualified biologist.	Preconstruction surveys within 30 days prior to the commencement of any on-site Project activities.	Verify Pre-Construction Surveys Conducted. Field Inspection signoff, and compliance report by Qualified Biologist	Qualified Biologist City of Rialto Community Development Department, Planning Division		
MM BIO-6B: Special-Status Preconstruction Lizard Surveys. If pre-construction surveys are positive for coastal whiptail, coast horned lizard, or Southern California legless lizard and avoidance is not feasible, CDFW shall be notified in writing. In addition, relocation of all observed special-status lizard individuals shall be attempted and, if feasible, lizards would be relocated to the nearest available suitable habitat on conserved land in consultation with CDFW.	During pre-construction surveys.	Verify Pre-Construction Surveys Conducted. Cultural Resources					
MM CUL-1 Retention of Archaeologist. Prior to issuance of any permit for ground-disturbing activities, the Project Applicant shall provide evidence to the City of Rialto (City) that a qualified professional archaeologist meeting Secretary of the Interior professional qualifications (Project Archaeologist) has been retained.	Prior to issuance of any permit for ground-disturbing activities.	Verify Pre-Construction Surveys Conducted. Field Inspection signoff, and compliance report by Qualified Archaeologist.	Project Archeologist City of Rialto Community Development Department, Planning Division		
MM CUL-2: Cultural Resource Management Plan. Prior to any ground-disturbing activities the Project Archaeologist shall develop a Cultural Resource Management Plan (CRMP) to address the details, timing, and responsibilities of all archaeological and cultural resource activities that occur on the project site. The CRMP shall be written in consultation with the Consulting Tribes and shall include the following: approved Mitigation Measures (MM)/Conditions of Approval (COA), contact information for all pertinent parties, parties' responsibilities, procedures for each MM or COA, and an overview of the Project schedule.	Prior to issuance of any permit for ground-disturbing activities.	Approval of Cultural Resources Management Plan	Project Archeologist City of Rialto Community Development Department, Planning Division Consulting Tribes		
MM CUL-3: Cultural Resources Sensitivity Training. A Cultural Resources Training shall be provided to all construction managers and construction personnel prior to commencing any ground disturbance work within the project area. The training shall be prepared and conducted or overseen by the Project Archaeologist. The training content shall include, but is not limited to, information about any known cultural resources in Project area and vicinity and the process for inadvertent discovery. The training may be discontinued when ground disturbance is completed. Construction personnel shall not be permitted to operate equipment within the construction area unless they have attended the training. The Qualified Archeologist or designated Archaeological Monitor and Monitoring Tribes' designated representatives shall attend the pre-grade meeting with the grading contractors to conduct the initial training and explain and coordinate the requirements of the Cultural Resource Management Plan.	Prior to commencing any ground disturbance work.	Verify Pre-Construction Surveys Conducted. Field Inspection signoff, and compliance report by Qualified Archaeologist	Construction Managers and Construction Personnel, Project Archaeologist or designated Archaeological Monitor City of Rialto Community Development Department, Planning Division Monitoring Tribes		
MM CUL-4: Archaeological Monitoring. The Project Archaeologist shall monitor or supervise archaeological monitors (Monitors) for initial ground disturbing activities. After initial grading, should no cultural resources be present and/or subsurface soils indicate a low likelihood for significant intact resources, the Project Archaeologist shall	Archeological monitoring during initial ground disturbing activities.	Verify Pre-Construction Surveys Conducted. Field Inspection signoff, and	Project Archaeologist City of Rialto Community Development Department, Planning Division

have the ability to recommend archaeological monitoring be decreased or eliminated after initial ground-disturbing activities are complete, which shall be approved in writing by the City. Any such recommendation shall be specific to archaeological monitoring and not impact the implementation of Mitigation Measures TCR-1 and/or TCR-2.		compliance report by Qualified Archaeologist			
MM CUL-5: Inadvertent Discovery of Cultural Resources. In the event that cultural resources are discovered during Project implementation, all earthwork and ground-disturbing activities shall halt within a buffer of the discovery established by the Project Archaeologist and the Project Archaeologist shall assess the nature and significance of the find. The Project Archaeologist shall coordinate with the City and identify whether the resource is potentially significant and if it requires further evaluation. Work on the other portions of the project site outside of the buffered area may continue during this assessment period. If the cultural resources are Native American in origin, the Consulting Tribes must be immediately contacted and consulted regarding potential significance and treatment of the resource. Specifically, the Consulting Tribes shall be contacted, as detailed within Tribal Cultural Resources (TCR) Mitigation Measure 3, regarding any pre-contact finds and shall be provided information after the Project Archaeologist makes his/her initial assessment of the nature of the find, so as to provide Tribal input with regard to significance and treatment. For any potential significant cultural resources, the Project Archaeologist shall make recommendations to the City to avoid or mitigate impacts to the resource. If significant pre-contact cultural resources, as defined by CEQA, are discovered and avoidance cannot be ensured, the archaeologist shall develop a Monitoring and Treatment Plan, the drafts of which shall be provided to the Consulting Tribes for review and comment, as detailed within TCR-1. The Project Archaeologist shall monitor the remainder of the Project and implement the Monitoring and Treatment Plan accordingly. Preservation in place (i.e. avoidance) is the preferred manner of treatment. If preservation in place is not feasible, treatment may include implementation of archaeological data recovery to excavate the resource along with subsequent laboratory processing and analysis. Disposition of significant Native American archaeological materials, such as reburial or curation by a qualified repository within San Bernardino County, shall be agreed upon	During Project implementation	Verify Pre-Construction Surveys Conducted. Field Inspection signoff, and compliance report by Qualified Archaeologist	Project Archaeologist Consulting Tribes City of Rialto Community Development Department, Planning Division South Central Coastal Information Center (SCCIC)

				Date	**Initials**
by the City and Consulting Tribes. Any significant non-Native American archaeological material shall be curated at a public, non-profit institution with a research interest in the materials within San Bernardino County, if such an institution agrees to accept the material. If no institution accepts the archaeological material, it shall be offered to a local school or historical society in the area for educational purposes. All identified cultural resources shall be recorded on appropriate California Department of Parks and Recreation (CA DPR 523) series forms and evaluated for significance. All findings shall be included within a Monitoring Report drafted by the Project Archaeologist and submitted to the City and Consulting Tribes for review. Final copies of the Monitoring Report shall be submitted to the City, Consulting Tribes, and South Central Coastal Information Center (SCCIC).					
SC CUL-1. If human remains are encountered during the undertaking, California State Health and Safety Code Section 7050.5 states that excavation shall stop and no further disturbance shall occur within 100 feet of the discovery until the County Coroner has made a determination of origin and disposition of the remains pursuant to Public Resources Code Section 5097.98. The County Coroner must be notified of the find immediately. If the remains are determined to be prehistoric, the Coroner will notify the Native American Heritage Commission (NAHC), which will determine and notify a Most Likely Descendant (MLD). With the permission of the landowner or his/her authorized representative, the MLD may inspect the site of the discovery within 48 hours of notification. If the NAHC is unable to identify an MLD, the MLD fails to make a recommendation, or the landowner or his/her authorized representative rejects the recommendation, the human remains and associated items will be interred on the property with appropriate dignity in a location that will not be subject to future disturbance.	During excavation (if applicable)	Verify Pre-Construction Surveys Conducted. Field Inspection signoff, and compliance report by Qualified Archaeologist	City of Rialto Community Development Department, Planning Division County Coroner Native American Heritage Commission (NAHC) Most Likely Descendant (MLD)		
Geology and Soils					
SC GEO-1. The Applicant shall submit to the City of Rialto Community Development Department and Public Works Department for review and approval, a site-specific design-level geotechnical investigation prepared for the project site by a registered geotechnical engineer. The investigation shall comply with all applicable State and local code requirements and:	Prior to the issuance of the first grading permit for ground-disturbing activities.	Verify Pre-Construction Surveys Conducted. Field Inspection signoff, and compliance report by Qualified Geologist	Project Applicant City of Rialto Community Development Department		

Locust Gateway Development Project Mitigation Monitoring and Reporting Program					
Standard Conditions; Mitigation Measures; Laws, Ordinances and Regulations	**Implementation Timing**	**Monitoring/Reporting Method**	**Responsible Party for Implementation/ Approval**	**Verification**	
				Date	**Initials**
a) Include an analysis of the expected ground motions at the site from known active faults using accepted methodologies; b) Determine structural design requirements as prescribed by the most current version of the California Building Code, including applicable City amendments, to ensure that structures can withstand ground accelerations expected from known active faults; and c) Determine the final design parameters for walls, foundations, foundation slabs, utilities, roadways, parking lots, sidewalks, and other surrounding related improvements. Project plans for foundation design, earthwork, and site preparation shall incorporate all of the mitigation in the site-specific investigations. The structural engineer shall review the site-specific investigations, provide any additional necessary measures to meet Building Code requirements, and incorporate all applicable recommendations from the investigation in the structural design plans and shall ensure that all structural plans for the Project meet current Building Code requirements. The City's registered geotechnical engineer or third-party registered engineer retained to review the geotechnical reports shall review each site-specific geotechnical investigation, approve the final report, and require compliance with all geotechnical requirements contained in the investigation in the plans submitted for the grading, foundation, structural, infrastructure and all other relevant construction permits. The City shall review all Project plans for grading, foundations, structural, infrastructure and all other relevant construction permits to ensure compliance with the applicable geotechnical investigation and other applicable Code requirements.			City of Rialto Public Works Department City of Rialto's registered geotechnical engineer or third-party registered engineer		
MM GEO-1: Paleontological Monitoring. Prior to the issuance of any grading permits, or any permit authorizing ground disturbance, the Project Applicant shall, to the satisfaction of the City of Rialto Community Development Director, demonstrate that a qualified paleontologist has been retained to respond on an as-needed basis to address unanticipated paleontological discoveries. A paleontologist is defined as an individual with an M.S./M.A. or Ph.D. in paleontology or geology who is familiar with paleontological procedures and techniques, and who is knowledgeable in the geology and paleontology of the area.	Prior to the issuance of any grading permits for ground-disturbing activities.	Verify Pre-Construction Surveys Conducted. Field Inspection signoff, and compliance report by Qualified Paleontologist	Project Applicant City of Rialto Community Development Director Qualified Paleontologist		

Locust Gateway Development Project Mitigation Monitoring and Reporting Program					
Standard Conditions; Mitigation Measures; Laws, Ordinances and Regulations	**Implementation Timing**	**Monitoring/Reporting Method**	**Responsible Party for Implementation/ Approval**	**Verification**	
				Date	**Initials**
In the event that fossils or fossil-bearing deposits are inadvertently unearthed during excavation and grading activities, all earth disturbing activities within a 100-foot radius of the area of discovery shall be temporarily halted or diverted. The qualified paleontologist shall be contacted to evaluate the significance of the finding and determine an appropriate course of action in accordance with Society of Vertebrate Paleontology standards and assess the significance of the find under the criteria set forth in CEQA Guidelines Section 15064.5. The paleontologist shall notify the appropriate agencies to determine procedures that would be followed before construction is allowed to resume at the location of the find. If in consultation with the paleontologist, City staff and the Project Applicant determine that avoidance is not feasible, the paleontologist shall prepare an excavation plan for reducing the effect of the Project on the qualities that make the resource important. The plan shall be submitted to the City for review and approval and the Project Applicant shall implement the approval plan.					
Greenhouse Gas Emissions					
LOR GHG-1. Limit idling time for commercial vehicles to no more than five minutes per Title 13 of the California Code of Regulations, Section 2485.	Ongoing during construction	On-site inspections	City of Rialto Public Works Department, Engineering Services		
LOR GHG-2. In accordance with California Title 24 Standards, buildings will be designed to have 15 percent of the roof area "solar ready" that will structurally accommodate later installation of rooftop solar panels. If future building operators pursue providing rooftop solar panels, they will submit plans for solar panels prior to occupancy.	Condition of issuance of Building Permit	On-site inspections	City of Rialto Community Development Department, Building and Safety Division		
LOR GHG-3. Install water-efficient irrigation systems and devices, such as soil moisture-based irrigation controls and sensors for landscaping, according to the City's Water Efficient Landscape requirements (Chapter 12.50 of the City's Municipal Code).	Prior to Issuance of Occupancy Permit	Documentation of Low Water Use Landscaping	City of Rialto Community Development Department, Planning Division		
LOR GHG-4. Design buildings to be water efficient. Install water-efficient fixtures in accordance with Section 5.303 of the California Green Building Standards Code Part 11.	Condition of issuance of Building Permit Prior to issuance of Occupancy Permit	On-site inspections	City of Rialto Community Development Department, Building and Safety Division		

Locust Gateway Development Project Mitigation Monitoring and Reporting Program					
Standard Conditions; Mitigation Measures; Laws, Ordinances and Regulations	**Implementation Timing**	**Monitoring/Reporting Method**	**Responsible Party for Implementation/ Approval**	**Verification**

LOR GHG-5. Recycle and/or salvage for reuse a minimum of 65 percent of the nonhazardous construction and demolition waste in accordance with Section 5.408.1 of the California Green Building Standards Code Part 11.	Ongoing during demolition and construction	On-site inspections	City of Rialto Community Development Department, Building and Safety Division		
LOR GHG-6. Provide storage areas for recyclables and green waste and adequate recycling containers located in readily accessible areas in accordance with Section 5.410 of the California Green Building Standards Code Part 11.	Condition of issuance of Building Permit Prior to issuance of Occupancy Permit	On-site inspections	City of Rialto Community Development Department, Building and Safety Division		
LOR GHG-7. To facilitate future installation of electric vehicle supply equipment (EVSE), construction shall comply with Section 5.106.5.3 (nonresidential electric vehicle charging) of the California Green Building Standards Code Part 11.	Condition of issuance of Building Permit Prior to issuance of Occupancy Permit	On-site inspections	City of Rialto Community Development Department, Building and Safety Division		
MM GHG-1: On-Site Renewable Electricity Generation. Prior to the issuance of the final Certificate of Occupancy for the building tenant, documentation shall be provided to the City demonstrating that the Project has either: 1) installed solar photovoltaic (PV) panels or other source of renewable energy generation on the site, or 2) otherwise acquired energy from the local utility that has been generated by renewable sources, such that either option will provide 100 percent of the expected building load which is anticipated to be approximately 1.42 kilowatt hours per year [kWh/year] per square foot). Alternatively, the Project may achieve 100 percent of the building's expected energy load through a combination of on-site renewable energy generation and renewable energy purchase. The final PV generation facility size requires approval by Southern California Edison (SCE). Should SCE limit the facility size, the amounts above shall be limited to the amount of SCE's approval. This mitigation measure applies only to tenant improvements and not the building shell approvals.	Prior to the issuance of the final Certificate of Occupancy for the building tenant.		Project Applicant City of Rialto Community Development Department, Building and Safety Division Southern California Edison (SCE)		
MM GHG-2: CALGreen Tier 2. Prior to the issuance of a building permit, the Project Applicant or successor in interest shall provide documentation to the City of Rialto Community Development Department, Building and Safety Division demonstrating that the Project is designed to meet or exceed 2022 CALGreen Tier 2 standards in effect at the time of building permit application.	Prior to the issuance of a building permit.	Field inspection signoff	Project Applicant City of Rialto Community Development Department, Building and Safety Division		
MM GHG-3: Solid Waste Diversion. Prior to issuance of tenant occupancy permits, the Project operator shall designate a solid waste management coordinator and	Prior to issuance of tenant occupancy permits	Field inspection signoff	Project Applicant

implement a waste management plan to recycle and/or salvage nonhazardous debris to achieve a minimum 75 percent diversion from landfills. The City of Rialto Community Development Department, Planning Division shall confirm that sales or lease agreements includes contractual language that obligates tenants, operators, or future owners to comply with the solid waste management plan. This mitigation measure applies only to tenant permits and not the building shell approvals.			City of Rialto Community Development Department, Planning Division		
MM GHG-4: Water Use Efficiency and Conservation Plan. The Project Applicant or designee shall implement a Water Use Efficiency and Conservation Plan that includes the following minimum requirements: **Indoor Conservation Features and Operations:** ▪ Install low-flow Fixtures: Install low-flow toilets at 1.28 gallons per flush, faucets at 1.2 gallons per minute, showerheads at 1.8 gallons per minute, kitchen faucets at 1.8 gallons per minute. In common areas, install faucets at 0.5 gallon per minute and urinals at max of 0.25 gallon per minute/flush. (These fixtures use less water while maintaining efficient performance.) ▪ Install dual-flush toilets: These toilets offer two flush options: one for liquid waste less than 1 gallons per minute and another for solid waste at 1.28 gallons per minute. (This allows the appropriate use of water for flushing needs.) ▪ Use water-efficient appliances: The Project Applicant or designee shall install energy-efficient and water-saving appliances with the ENERGY STAR label only. ▪ Good housekeeping and regular maintenance: The Project Applicant or designee shall regularly check and maintain plumbing fixtures, irrigation systems, and appliances to ensure they are functioning efficiently and not wasting water. **Outdoor Conservation Features and Operations:** ▪ Install only "Smart Irrigation Systems" for community landscaping: The Project Applicant or designee shall use smart sprinkler systems that adjust watering schedules based on weather conditions, soil moisture, and plant needs to avoid over or wasteful watering. The Project Applicant or designee shall also incorporate seasonal specific controls to ensure watering occurs during the most efficient times of day.	Condition of issuance of Building Permit Confirmation prior to Certificate of Occupancy	On-site inspection	Project Applicant City of Rialto Community Development Department, Building and Safety Division

▪ Adjustable Water Pressure Regulator: The Project Applicant or designee shall install pressure regulators to maintain optimal water pressure, preventing overuse and leaks. ▪ Drought-tolerant landscaping: The Project Applicant or designee shall include native and drought-tolerant vegetation that requires less water to thrive and is known to survive in the City of Rialto. The Project Applicant or designee shall replace drought-tolerant landscaping if it dies through enforceable Project CC&Rs and/or tenant lease agreements.					
Hazards and Hazardous Materials					
MM HAZ-1: Asbestos Survey and Lead-Based Paint Survey. Prior to approval of a demolition permit by the City of Rialto, an asbestos survey and a lead-based paint survey shall be conducted pursuant to applicable local, State, and federal laws. All asbestos-containing building materials shall be removed prior to structure demolition. Abatement or paint stabilization techniques shall be applied prior to demolition. Such measures shall include removal and stabilization of loose, flaking or peeling paint. Measures shall be taken to ensure that paint chips are not generated in the demolition process. All work shall be performed by an abatement contractor who is certified by the California OSHA Division of Occupational Safety and Health (Cal/OSHA) with properly trained and registered workers. All abatement techniques shall be in accordance with Cal/OSHA and U.S. Environmental Protection Agency (U.S. EPA) protocol and also in conformance with South Coast Air Quality Management District (SCAQMD) rules. All removed asbestos-containing building materials and lead-based paint shall be properly disposed of at a landfill certified to accept said materials, and waste shall be transported under the waste manifest by a certified waste transportation company. Once all of these materials have been removed, structure demolition may commence.	Prior to approval of a demolition permit.	Field inspection signoff	City of Rialto Community Development Department, Building and Safety Division Abatement Contractor		
MM HAZ-2: Munitions Monitor. Prior to issuance of grading permits, the Applicant shall submit proof to the City of Rialto Director of Community Development of the retainment of a munitions expert. A munitions expert must be an individual that is qualified to perform appropriate tasks per Department of Defense Explosives Safety	Prior to the issuance of the first grading permit Daily monitoring during grading activities	Field inspection signoff	Project Applicant City of Rialto Director of Community Development

				Date	**Initials**
Board Technical Paper-18 (DESB TP-18) standards. The munitions expert shall be onsite to monitor grading activities for unexploded ordinances (UXOs) and discarded military munitions (DMMs) and provide daily safety briefings before the start of construction. If UXOs are encountered during this process, the munitions expert shall have the authority to halt all or a portion of construction activities and contact the City of Rialto Police department at (909) 820-2550 to report and determine proper UXO handling and disposal. The munitions expert shall have the authority to halt all or a portion of construction activities at their discretion until such time that an encountered UXO is deemed properly disposed of.			Munitions Expert		
MM HAZ-3: Soil Management Plan. Prior to the issuance of a grading permit, the Applicant shall submit a Soil Management Plan (or equivalent document) to be implemented for construction of the Proposed Project. The objective of the Soil Management Plan is to provide guidance for the proper handling, onsite management, and disposal of impacted soil that might be encountered during construction activities. The plan would include practices that are consistent with the California Title 8, Occupational Safety and Health Administration (Cal-OSHA) regulations, as well as appropriate remediation standards that are protective of the planned use. Appropriately trained professionals would be on site during preparation, grading, and related earthwork activities to monitor soil conditions encountered. The Soil Management Plan would provide guidelines for the following: ▪ Identifying impacted soil ▪ Assessing impacted soil ▪ Soil excavation ▪ Impacted soil storage ▪ Verification sampling ▪ Impacted soil characterization and disposal The plan shall outline how Project construction crews would identify, handle, and dispose of potentially contaminated soil; identify the qualifications of the appropriately trained professionals that would monitor soil conditions and conduct soil sampling during construction; coordinate laboratory testing; and oversee disposal. The Soil Management Plan shall also include requirements for documenting and reporting incidents of encountered contaminants, such as documenting locations of occurrence,	Prior to the issuance of a grading permit. Soil Management Plan shall be submitted to the city and CUPA 45 days prior to the start of construction for review and approval.	Field inspection signoff	Project Applicant City of Rialto Community Development Department, Building and Safety Division CUPA

sampling results, and reporting actions taken to dispose of contaminated materials. In the event that potentially contaminated soils were encountered within the footprint of construction, soils would be tested and stockpiled. The appropriate Certified Unified Program Agency (CUPA) would determine whether further assessment is warranted. The Soil Management Plan shall be submitted to the city and CUPA 45 days prior to the start of construction for review and approval.					
MM-HAZ 4: Contaminated Soil Treatment. If previously unidentified soil contamination is observed by sight or odor or indicated by testing by a qualified professional using a portable volatile organic compound analyzer during excavation and grading activities, excavation and grading within such an area shall be temporarily halted and redirected around the area until the appropriate evaluation and follow-up measures are implemented, as contained in the South Coast Air Quality Management District's Rule 1166, to make the area suitable for grading activities to resume. In the event contamination is found, the Applicant shall notify the San Bernardino County Fire Department and the South Coast Air Quality Management District, as applicable. The contaminated soil shall be evaluated and excavated/disposed of, treated in-situ (in-place), or otherwise managed and disposed of in accordance with all applicable federal, State, and local laws and regulations.	During excavation and grading activities.	Field inspection signoff	Project Applicant San Bernardino County Fire Department South Coast Air Quality Management District City of Rialto Community Development Department, Building and Safety Division		
Hydrology and Water Quality					
SC HYD-1. The Applicant or his/her designees shall obtain a General Permit for Stormwater Discharge Associated with Construction Activity (Construction Activity General Permit). The Applicant or his/her designees shall provide a copy of this permit to the City Public Works Department prior to the issuance of the first grading permit.	Prior to the issuance of the first grading permit	Verify permit	Project Applicant City of Rialto Public Works Department		
SC HYD-2. Prior to issuance of the first grading permit, the Applicant shall submit to the City Engineer for approval, a Storm Water Quality Management Plan (SWQMP) specifically identifying Best Management Practices (BMPs) that will be incorporated into the Project to control stormwater and non-stormwater pollutants during and after construction. To ensure compliance, a legal and fiduciary enforcement mechanism in the form of a Storm Water Quality Management Plan Agreement shall be executed with the City of Rialto. This agreement shall additionally be recorded in the office of the County Recorder for the County of San Bernardino. The SWQMP shall	Prior to the issuance of the first grading permit	Verify plans	Project Applicant City of Rialto Engineer County Recorder for the County of San Bernardino

removal, potholing, auguring, grubbing, tree removal, boring, grading, excavation, drilling, and trenching. A copy of the executed monitoring agreement shall be submitted to the City of Rialto prior to the commencement of any ground-disturbing activity, or the issuance of any permit necessary to commence a ground-disturbing activity. The agreement would also address the consideration of rotating monitoring with the Morongo Band of Mission Indians. The monitor shall complete monitoring logs that provide descriptions of the relevant ground-disturbing activities, the type of construction activities performed, locations of ground-disturbing activities, soil types, cultural-related materials, and any other facts, conditions, materials, or discoveries of significance to the Tribe. Monitor logs shall identify and describe any discovered Tribal Cultural Resources, including but not limited to, Native American cultural and historical artifacts, remains, places of significance, etc., (collectively, tribal cultural resources, or "TCR"), as well as any discovered Native American (ancestral) human remains and burial goods. Copies of monitor logs shall be provided to the Project Applicant/City of Rialto upon written request to the Tribe. On-site tribal monitoring shall conclude upon one of the following (1) written confirmation to the Kizh from a designated point of contact for the Project Applicant or City of Rialto that all ground-disturbing activities and phases that may involve ground-disturbing activities on the project site or in connection with the Project are complete; or (2) a determination and written notification by the Kizh to the Project Applicant or City of Rialto that no future, planned construction activity and/or development/construction phase at the project site possesses the potential to impact Kizh TCRs.					
MM TCR-2: Native American Monitoring for Morongo Band of Mission Indians. Prior to the issuance of the first permit that would result in a "ground-disturbing activity," the Applicant shall enter into a Tribal Monitoring Services Agreement with the Morongo Band of Mission Indians for the Project. The agreement would also address the consideration of rotating monitoring with the Gabrieleño Band of Mission Indians – Kizh Nation. The Tribal Monitor shall be on-site during all (or as deemed necessary)	Prior to the issuance of the first permit that would result in a ground-disturbing activity	Field Inspection signoff by Qualified Monitor	Project Applicant City of Rialto Community Development Department, Planning Division

ground-disturbing activities (including, but not limited to, clearing, grubbing, tree and bush removal, grading, trenching, fence post placement and removal, construction excavation, excavation for all utility and irrigation lines, and landscaping phases of any kind). The Tribal Monitor shall have the authority to temporarily divert, redirect, or halt the ground-disturbing activities to allow identification, evaluation, and potential recovery of cultural resources. The Tribal Monitor can establish a buffer around the discovery.			Gabrieleño Band of Mission Indians – Kizh Nation, Morongo Band of Mission Indians		
MM TCR-3: Inadvertent Discovery of a Tribal Cultural Resource. The Consulting Tribes shall be contacted and informed of any pre-contact cultural resources discovered during Project implementation and be provided information regarding the nature of the find, so as to provide Tribal input with regards to significance and treatment (pursuant to Mitigation Measure [MM] CUL-5). Should the find be deemed significant, as defined by CEQA, the find shall be addressed to the protocols outlined in the Cultural Resources Management Plan from MM CUL-2. Any and all archaeological/cultural documents created as a part of the Project (isolate records, site records, survey reports, testing reports, etc.) shall be supplied to the Project Applicant and the City of Rialto for dissemination to the Consulting Tribes.	Ongoing during grading	Field Inspection signoff by Qualified Monitor Consultation with Tribes, as necessary	Consulting Tribes Qualified Archaeologist City of Rialto Community Development Department, Planning Division		

END OF EXHIBIT B

RESOLUTION NO. 2025-XX

A RESOLUTION OF THE PLANNING COMMISSION OF THE CITY OF RIALTO, CALIFORNIA RECOMMENDING THAT THE CITY COUNCIL APPROVE TENTATIVE PARCEL MAP NO. 2023-0006 TO PROVIDE PUBLIC RIGHT-OF-WAY DEDICATIONS AND TO RESOLVE UNDERLYING PAST RECORDINGS AND INSTRUMENTS RELATED TO ONE (1) 38.89 GROSS ACRE PARCEL OF LAND (APN: 0239-192-23) LOCATED AT THE SOUTHWEST CORNER OF LOCUST AVENUE AND LOWELL STREET WITHIN THE GENERAL MANUFACTURING (I-GM) LAND USE DISTRICT OF THE RIALTO AIRPORT SPECIFIC PLAN.

WHEREAS, the applicant, IV5 Locust Gateway LLC, proposes to provide public right-of-way dedications and to resolve underlying past recordings and instruments ("Project") related to one (1) 38.89 gross acre parcel of land (APN: 0239-192-23) located at the southwest corner of Locust Avenue and Lowell Street within the General Manufacturing (I-GM) land use district of the Rialto Airport Specific Plan ("Site"); and

WHEREAS, the Project within the I-GM land use district requires the approval of a tentative parcel map, and the Applicant has agreed to apply for a Tentative Parcel Map No. 2023-0006, also referred to as Tentative Parcel Map No. 20809 ("TPM No. 20809"), in accordance with Government Code Sections 66473.5 and 66474; and

WHEREAS, in conjunction with the Project, the applicant has applied for Conditional Development Permit No. 2023-0032 ("CDP No. 2023-0032") to facilitate the development and operation of a 664,859 square foot industrial warehouse building on the Site; and

WHEREAS, in conjunction with the Project, the applicant has applied for Precise Plan of Design No. 2023-0041 ("PPD No. 2023-0041") to facilitate the development of a 664,859 square foot industrial warehouse building with associated paving, landscaping, fencing, lighting, and drainage improvements on the Site; and

WHEREAS, on December 17, 2025, the Planning Commission of the City of Rialto conducted a duly noticed public hearing, as required by law, on TPM No. 20809, CDP No. 2023-0032, and PPD No. 2023-0041, took testimony, at which time it received input from staff, the city

attorney, and the applicant; heard public testimony; discussed the proposed TPM No. 20809, CDP No. 2023-0032, and PPD No. 2023-0041; and closed the public hearing; and

WHEREAS, all legal prerequisites to the adoption of this Resolution have occurred.

NOW, THEREFORE, BE IT RESOLVED by the Planning Commission of the City of Rialto as follows:

SECTION 1. The Planning Commission hereby specifically finds that all of the facts set forth in the recitals above of this Resolution are true and correct and incorporated herein.

SECTION 2. Based upon the forgoing and substantial evidence presented to the Planning Commission during the public hearing conducted with regard to TPM No. 20809, including, but not limited to, written staff reports, verbal testimony, presentations by City staff, site plan, and other supporting documents, and the conditions of approval stated herein, the Planning Commission hereby determines that TPM No. 20809 satisfies the requirements of Government Code Sections 66473.5 and 66474 and Section 17.16.070 of the Rialto Municipal Code pertaining to the findings which must be made precedent to approving a tentative map. The findings are as follows:

1. That the proposed Tentative Parcel Map is consistent with the General Plan of the City of Rialto and the General Manufacturing (I-GM) land use district of the Rialto Airport Specific Plan; and

This finding is supported by the following facts:

The Site has a General Plan designation of General Industrial with a Specific Plan Overlay, and a land use designation of General Industrial (I-GM) within the Rialto Airport Specific Plan. The Project will provide the necessary public right-of-way dedication to facilitate the development of a new industrial warehouse building on the Site, which is permitted within the underlying General Plan and Specific Plan land use designations. Furthermore, the right-of-way dedication will reduce the size of the parcel that makes up the Site from 38.89 gross acres to 38.78 net acres. However, per Table 9 (Development Standards – Non-Residential Designations) of the Rialto Airport Specific Plan, the required minimum parcel size within the I-GM land use designation is 0.5 acres. The final parcel will greatly exceed the required minimum size.

2. That the design and improvements of the proposed tentative parcel map are consistent with the Subdivision Ordinance, the General Plan of the City of Rialto, and the General Manufacturing (I-GM) land use district of the Rialto Airport Specific Plan.

This finding is supported by the following facts:

The Project will comply with all technical standards required by Subdivision Map Act, the General Plan of the City of Rialto, and the I-GM land use designation of the Rialto Airport Specific Plan. The final parcel will exceed the minimum lot dimensions as required by the I-GM land use district of the Rialto Airport Specific Plan.

3. That the site is physically suitable for the type of proposed development; and

This finding is supported by the following facts:

The Site is a relatively flat piece of land and development of the land should be easily accommodated. The Applicant will be required to submit a grading plan and geotechnical/soils report to the Public Works Department for review and approval prior to issuance of any building permits.

4. That the site is physically suitable for the proposed density of the development; and

This finding is supported by the following facts:

The Project will provide the necessary public right-of-way dedications reducing the size of the parcel that makes up the Site from 38.89 gross acres to 38.78 net acres. Subsequently, the applicant will construct a 664,859 square foot industrial warehouse building on the Site. Table 9 (Development Standards – Non-Residential Designations) of the Rialto Airport Specific Plan does not have criteria restricting the maximum allowable Floor Area Ratio (FAR) or Lot Coverage for a development in the I-GM land use district. However, the proposed development does comply with all of the development standards of the I-GM land use district that are contained within the Table 9 (Development Standards – Non-Residential Designations) of the Rialto Airport Specific Plan and Chapter 18.112 (Indoor Storage Uses) of the Rialto Municipal Code, including building setbacks, landscape setbacks, parking, etc.

5. That the design of the land division is not likely to cause substantial environmental damage or substantially injure fish, wildlife, or their habitat; and

This finding is supported by the following facts:

The Site is completely undeveloped and covered by natural grasses and shrubs. The Environmental Impact Report (Environmental Assessment Review No. 2023-0051) prepared for the project identified that the Site did not have suitable habitat for any threatened or endangered species. Nevertheless, the Environmental Impact Report prepared for the Project includes two (2) mitigation measures requiring pre-construction surveys to ensure that burrowing owls and other nesting birds are not present on the Site. Implementation of those two (2) mitigation measures will reduce any potential impacts on biological resources to a less than significant level.

6. That the design of the land division is not likely to cause serious public health problems; and

This finding is supported by the following facts:

The Project is consistent with the General Plan and the General Manufacturing (I-GM) land use district of the Rialto Airport Specific Plan. To the north of the project site, across Lowell Street, are several existing industrial developments, and to the east, across Locust Avenue, is approximately 4.75 acres of vacant land. To the south are several existing industrial developments, and to the west is a concrete mix manufacturing facility operated by Robertson's Ready Mix. The project is not expected to negatively impact any uses with the successful implementation of mitigation measures. Measures, such as landscape buffering and the installation of solid screen walls, will be implemented as a part of the Project to prevent any negative impacts to the nearby land uses. Furthermore, construction impacts on the site will be limited through the strict enforcement of the allowable construction hours listed in Section 9.50.070 of the Rialto Municipal Code, as well as enforcement of regular watering of the site to limit airborne dust and other particulate matter. As a result, the Project is not likely to cause any public health problems.

7. That the design of the land division or proposed improvements will not conflict with easements, acquired by the public at large, for access through or use of, property within the proposed land division.

This finding is supported by the following facts:

Seven (7) easements currently exist on the Site – one (1) for sewer and drainage purposes, three (3) for public utility purposes, and three (3) for ingress, egress, and roadway purposes. Upon completion of the Final Map and street dedication, all seven (7) easements will be vacated. The easements are not needed to facilitate the development and operation of one (1) 664,859 square foot industrial warehouse development and the associated on-site and off-site improvements on the Site.

8. That the discharge of waste from the proposed subdivision into an existing community sewer system would not result in violation of existing requirements prescribed by a California regional water quality control board pursuant to Division 7 (commencing with 13000) of the Water Code.

The industrial warehouse building proposed by the Applicant will be required to connect to the City sewer system via the Conditions of Approval for PPD No. 2023-0041. Rialto Water Services has reviewed the Project and determined a sewer main on Lowell Street that leads to a sewer main on Locust Avenue is available for connection. Additionally, the City of Rialto Public Works Department will review and approve sewer improvement plans for the industrial warehouse building prior to issuance of a building permit.

SECTION 3. An Environmental Impact Report (Environmental Assessment Review No. 2023-0051) has been prepared for the proposed Project in accordance with the California Environmental Quality Act (CEQA) and it has been determined that the Project will create

unavoidable significant impacts to greenhouse gas emissions. On December 17, 2025, by Resolution No. _____, the Planning Commission recommended that the City Council certify the above-reference Environmental Impact Report, make certain findings, and adopt a Statement of Overriding Considerations and a Mitigation Monitoring and Reporting Plan, which Resolution No. _____ together with the above-referenced Environmental Impact Report are incorporated herein by reference. The Planning Commission further finds that TPM No. 20809 is within the scope of the above-referenced Environmental Impact Report. Accordingly, the Planning Commission has forwarded, or is forwarding, a recommendation to the City Council to adopt the above-referenced Environmental Impact Report prepared for the Project.

SECTION 4. Based upon the forgoing and substantial evidence presented to the Planning Commission during the public hearing conducted with regard to TPM No. 20809, including, but not limited to, written staff reports, verbal testimony, presentations by City staff, site plan, and other supporting documents, and the conditions of approval stated herein, the Planning Commission hereby recommends that the City Council approve TPM No. 20809, subject to the following conditions:

1. TPM No. 20809 is approved allowing the dedication of public right-of-way and the resolution of underlying past recordings and instruments on the legal description related to one (1) 38.89 gross acre (38.78 net acre) parcel of land (APN: 0239-192-23) located at the southwest corner of Locust Avenue and Lowell Street within the General Manufacturing (I-GM) land use district of the Rialto Airport Specific Plan – for the purpose of developing one (1) 664,859 square foot industrial warehouse building, as shown on the tentative parcel map attached as Exhibit A, and as approved by the City Council.

2. City inspectors shall have access to the Site to reasonably inspect the Site during normal working hours to assure compliance with these conditions and other codes.

3. The applicant shall indemnify, protect, defend, and hold harmless, the City of Rialto, and/or any of its officials, officers, employees, agents, departments, agencies, and instrumentalities thereof (collectively, the "City Parties"), from any and all claims, demands, law suits, writs of mandamus, and other actions and proceedings (whether legal, equitable, declaratory, administrative or adjudicatory in nature), and alternative dispute resolutions procedures (including, but not limited to arbitrations, mediations, and other such procedures), (collectively "Actions"), brought against the City, and/or any of its officials, officers, employees, agents, departments, agencies, and instrumentalities thereof, that challenge, attack, or seek to modify, set aside, void, or annul, the any action of, or any permit or approval issued by, the City and/or any of its

officials, officers, employees, agents, departments, agencies, and instrumentalities thereof (including actions approved by the voters of the City), for or concerning the Project (collectively, the "Entitlements"), whether such Actions are brought under the California Environmental Quality Act, the Planning and Zoning Law, the Subdivision Map Act, Code of Civil Procedure Chapter 1085 or 1094.5, the California Public Records Act, or any other state, federal, or local statute, law, ordinance, rule, regulation, or any decision of a court of competent jurisdiction. This condition to indemnify, protect, defend, and hold the City harmless shall include, but not be limited to (i) damages, fees and/or costs awarded against the City, if any, and (ii) cost of suit, attorneys' fees and other costs, liabilities and expenses incurred in connection with such proceeding whether incurred by applicant, Property owner, or the City and/or other parties initiating or bringing such proceeding (collectively, subparts (i) and (ii) are the "Damages"). Notwithstanding anything to the contrary contained herein, the Applicant shall not be liable to the City Parties under this indemnity to the extent the Damages incurred by any of the City Parties in such Action(s) are a result of the City Parties' fraud, intentional misconduct or gross negligence in connection with issuing the Entitlements. The applicant shall execute an agreement to indemnify, protect, defend, and hold the City harmless as stated herein within five (5) days of approval of TPM No. 20809.

4. In accordance with the provisions of Government Code Section 66020(d)(1), the imposition of fees, dedications, reservations, or exactions for this Project, if any, are subject to protest by the applicant at the time of approval or conditional approval of the Project or within 90 days after the date of the imposition of the fees, dedications, reservations, or exactions imposed on the Project.

5. The applicant shall complete and abide by all pre-construction mitigation measures contained within the Mitigation Monitoring and Reporting Program associated with the Environmental Impact Report (Environmental Assessment Review No. 2023-0051) adopted for the Project, prior to the issuance of a grading permit.

6. The applicant shall complete and abide by all during-construction mitigation measures contained within the Mitigation Monitoring and Reporting Program associated with the Environmental Impact Report (Environmental Assessment Review No. 2023-0051) adopted for the Project, prior to the issuance of a Certificate of Occupancy.

7. The applicant shall secure the services of a tribal cultural monitor to be present during all ground disturbance activities associated with the construction of this project. The tribal cultural monitor shall be approved by the Gabrieleño Band of Mission Indians-Kizh Nation, and documentation of coordination between the applicant and the Gabrieleño Band of Mission Indians-Kizh Nation on this matter shall be provided to the Planning Division prior to the issuance of a grading permit.

8. The applicant shall submit a final parcel map (Parcel Map No. 20809), prepared by a California registered Land Surveyor or qualified Civil Engineer, to the Public Works Engineering Division for review and approval. A Title Report prepared for subdivision

guarantee for the subject property, the traverse closures for the existing parcel and all lots created therefrom, and copies of record documents shall be submitted with the Parcel Map to the Engineering Division as part of the review of the Map. The Parcel Map shall be approved by the City Council prior to issuance of building permits, except as allowed by the Subdivision Map Act. Prior to approval of the Parcel/Tract Map by the City Council, provide a Preliminary Subdivision Report from a title company and if applicable, provide evidence that Section 66436 of the Subdivision Map Act regarding interfering with the rights of easement holders has been addressed. Dedications to the public required by these conditions of approval shall be made via separate instrument or Parcel Map, whichever occurs first.

9. In accordance with Government Code 66462, all required public improvements shall be completed prior to the approval of Parcel Map No. 20809. Alternatively, the applicant may enter into a Subdivision Improvement Agreement to secure the cost of all required public improvements at the time of requesting the City Engineer's approval of Parcel Map No. 20809. The applicant will be required to secure the Subdivision Improvement Agreement pursuant to Government Code 66499 in amounts determined by the City Engineer.

10. The applicant shall comply with all other applicable State and local ordinances.

11. Pursuant to Section 17.16.050A of the Rialto Municipal Code, approval of TPM No. 20809 is granted for a period of twenty-four (24) months from the effective date of this resolution. Pursuant to Section 17.16.050C of the Rialto Municipal Code, an extension of time for TPM No. 20809 may be granted by the Planning Commission for a period or periods not to exceed a total of thirty-six (36) months. The period or periods of extension shall be in addition to the original twenty-four (24) months. An application shall be filed with the Planning Division for each extension together with the required fee prior to the expiration date of TPM No. 20809.

SECTION 5. The Chair of the Planning Commission shall sign the passage and adoption of this resolution and thereupon the same shall take effect and be in force.

PASSED, APPROVED AND ADOPTED this 17th day of December, 2025.

RESOLUTION NO. 2025-XX

A RESOLUTION OF THE PLANNING COMMISSION OF THE CITY OF RIALTO, CALIFORNIA RECOMMENDING THAT THE CITY COUNCIL APPROVE CONDITIONAL DEVELOPMENT PERMIT NO. 2023-0032 ALLOWING THE DEVELOPMENT AND OPERATION OF A 664,859 SQUARE FOOT INDUSTRIAL WAREHOUSE BUILDING 38.89 GROSS ACRES (38.78 NET ACRES) OF LAND (APN: 0239-192-23) LOCATED AT THE SOUTHWEST CORNER OF LOCUST AVENUE AND LOWELL STREET WITHIN THE GENERAL MANUFACTURING (I-GM) LAND USE DISTRICT OF THE RIALTO AIRPORT SPECIFIC PLAN.

WHEREAS, the applicant, IV5 Locust Gateway Logistics Center LLC, ("Applicant") proposes to develop and operate a 664,859 square foot industrial warehouse building with associated paving, landscaping, fencing, lighting, and drainage improvements ("Project") on approximately 38.89 gross acres (38.78 net acres) of land (APN: 0239-192-23) located at the southwest corner of Locust Avenue and Lowell Street within the General Manufacturing (I-GM) land use district of the Rialto Airport Specific Plan ("Site"); and

WHEREAS, the Project will consist of a 664,859 square foot industrial warehouse building, eighty-two (82) dock-high loading doors, concrete screen walls, an abundant amount of landscaping, and full pedestrian and vehicle access; and

WHEREAS, Pursuant to Ordinance No. 1653, the Project requires a Conditional Development Permit, and the applicant has agreed to apply for Conditional Development Permit No. 2023-0032 ("CDP No. 2023-0032"); and

WHEREAS, in conjunction with the Project, the applicant has applied for Tentative Parcel Map No. 2023-0006, also referred to as Tentative Parcel Map No. 20809 ("TPM No. 20809") to provide public right-of-way dedications and to resolve underlying past recordings and instruments related to the Site; and

WHEREAS, in conjunction with the Project, the applicant has applied for Precise Plan of Design No. 2023-0041 ("PPD No. 2023-0041") to facilitate the development of a 664,859 square foot industrial warehouse building with associated paving, landscaping, fencing, lighting, and drainage improvements on the Site; and

WHEREAS, on December 17, 2025, the Planning Commission of the City of Rialto conducted a duly noticed public hearing, as required by law, on CDP No. 2023-0032, TPM No. 20809, and PPD No. 2023-0041, took testimony, at which time it received input from staff, the city attorney, and the applicant; heard public testimony; discussed the proposed CDP No. 2023-0032, TPM No. 20809, and PPD No. 2023-0041; and closed the public hearing; and

WHEREAS, all legal prerequisites to the adoption of this Resolution have occurred.

NOW, THEREFORE, BE IT RESOLVED by the Planning Commission of the City of Rialto as follows:

SECTION 1. The Planning Commission hereby specifically finds that all of the facts set forth in the recitals above of this Resolution are true and correct and incorporated herein.

SECTION 2. Based upon the forgoing and substantial evidence presented to the Planning Commission during the public hearing conducted with regard to CDP No. 2023-0032, including, but not limited to, written staff reports, verbal testimony, presentations by City staff, site plans, and other supporting documents, and the conditions of approval stated herein, the Planning Commission hereby determines that CDP No. 2023-0032 satisfies the requirements of Section 18.66.020 of the Rialto Municipal Code pertaining to the findings which must be made precedent to granting a conditional development permit, which findings are as follows:

1. The proposed use is deemed essential or desirable to provide a service or facility which will contribute to the convenience or general well-being of the neighborhood or community; and

This finding is supported by the following facts:

The Site is "L"-shaped, expansive in size, and vacant. The Project will develop the highest and best use for the Site, in accordance with the General Manufacturing (I-GM) land use district of the Rialto Airport Specific Plan. Additionally, the Project will provide employment opportunities within the City and reduce blight by implementing a use on vacant, unimproved land.

2. The proposed use will not be detrimental or injurious to health, safety, or general welfare of persons residing or working in the vicinity; and

This finding is supported by the following facts:

The development of an industrial warehouse building on the Site is consistent with the underlying General Manufacturing (I-GM) land use district, which conditionally permits the development and operation of industrial warehouse buildings. To the north of the project site, across Lowell Street, are several existing industrial developments, and to the east, across Locust Avenue, is approximately 4.75 acres of vacant land. To the south are several existing industrial developments, and to the west is a concrete mix manufacturing facility operated by Robertson's Ready Mix. The nearby area is predominantly designated for and developed with industrial uses, and as a result, there are no sensitive land uses adjacent to the project site. The project is not expected to negatively impact any uses with the successful implementation of measures such as landscape buffering, the installation of solid screen walls, aesthetic building enhancements, and other traffic related measures.

3. The site for the proposed use is adequate in size, shape, topography, accessibility and other physical characteristics to accommodate the proposed use in a manner compatible with existing land uses; and

This finding is supported by the following facts:

The Site is 38.78 net acres in size and adjacent to two (2) public streets, which will be able to accommodate the proposed use. The Project will have three (3) points of access via Lowell Street and one (1) point of access via Locust Avenue. In addition, the building will have 365 passenger vehicle parking spaces, which exceeds the amount required by Chapter 18.58 (Off-Street Parking) of the Rialto Municipal Code.

4. The site has adequate access to those utilities and other services required for the proposed use; and

This finding is supported by the following facts:

The Site will have adequate access to all utilities and services required through main water, electric, sewer, and other utility lines that will be hooked up to the Site.

5. The proposed use will be arranged, designed, constructed, and maintained so as it will not be injurious to property or improvements in the vicinity or otherwise be inharmonious with the General Plan and its objectives, the Agua Mansa Specific Plan, or any zoning ordinances, and

This finding is supported by the following facts:

As previously stated, the proposed use is consistent with the General Manufacturing (I-GM) land use district of the Rialto Airport Specific Plan. The building will be oriented such that none of the dock doors will front or face the public right-of-way and the building will have 365 passenger vehicle parking spaces, all of which comply with the General Plan, the I-GM land use district of the Rialto Airport Specific Plan, Chapter 18.112 (Indoor Storage Facilities) of the Rialto Municipal Code, and the City's Design Guidelines. Additionally,

a landscape setback with a minimum depth of twenty (20) feet will be provided along the frontages of both Locust Avenue and Lowell Street.

6. Any potential adverse effects upon the surrounding properties will be minimized to every extent practical and any remaining adverse effects shall be outweighed by the benefits conferred upon the community or neighborhood as a whole.

This finding is supported by the following facts:

The Project's effects will be minimized through the implementation of the Conditions of Approval contained herein, and through the implementation of Conditions of Approval imposed by the City Council on the Precise Plan of Design, such as extensive landscaping, solid screen walls, and enhanced architectural features. The development of a high-quality industrial development will provide additional employment opportunities for residents and visitors to the City. The Project will also serve to develop a piece of land, which has remained undeveloped. The Project is consistent with the General Manufacturing (I-GM) land use district and the surrounding industrial land uses. The nearby area is predominantly designated for and developed with industrial uses, and as a result, there are no sensitive land uses adjacent to the project site. The project is not expected to negatively impact any uses with the successful implementation of measures such as landscape buffering, the installation of solid screen walls, aesthetic building enhancements, and other traffic related measures. Therefore, any potential adverse effects are outweighed by the benefits conferred upon the community and neighborhood as a whole.

SECTION 3. An Environmental Impact Report (Environmental Assessment Review No. 2023-0051) has been prepared for the proposed Project in accordance with the California Environmental Quality Act (CEQA) and it has been determined that the Project will create unavoidable significant impacts to greenhouse gas emissions. On December 17, 2025, by Resolution No. _____, the Planning Commission recommended that the City Council certify the above-reference Environmental Impact Report, make certain findings, and adopt a Statement of Overriding Considerations and a Mitigation Monitoring and Reporting Plan, which Resolution No. _____ together with the above-referenced Environmental Impact Report are incorporated herein by reference. The Planning Commission further finds that the CDP No. 2023-0032 is within the scope of the above-referenced Environmental Impact Report. Accordingly, the Planning Commission has forwarded, or is forwarding, a recommendation to the City Council to adopt the Environmental Impact Report prepared for the Project.

SECTION 4. Based upon the forgoing and substantial evidence presented to the Planning Commission during the public hearing conducted with regard to CDP No. 2023-0032, including, but

not limited to, written staff reports, verbal testimony, presentations by City staff, site plans, and other supporting documents, and the conditions of approval stated herein, the Planning Commission hereby recommends that the City Council approve CDP No. 2023-0032, in accordance with the plans and application on file with the Planning Division, subject to the following conditions:

1. The approval is granted allowing the development and operation of a 664,859 square foot industrial warehouse building on 38.89 gross acres (38.78 net acres) of land (APN: 0239-192-23) located at the southwest corner of Locust Avenue and Lowell Street, as shown on the plans attached as Exhibit A and as approved by the City Council. If the Conditions of Approval specified herein are not satisfied or otherwise completed, the project shall be subject to revocation.

2. City inspectors shall have access to the site to reasonably inspect the site during normal working hours to assure compliance with these conditions and other codes.

3. The applicant shall indemnify, protect, defend, and hold harmless, the City of Rialto, and/or any of its officials, officers, employees, agents, departments, agencies, and instrumentalities thereof (collectively, the "City Parties"), from any and all claims, demands, law suits, writs of mandamus, and other actions and proceedings (whether legal, equitable, declaratory, administrative or adjudicatory in nature), and alternative dispute resolutions procedures (including, but not limited to arbitrations, mediations, and other such procedures), (collectively "Actions"), brought against the City, and/or any of its officials, officers, employees, agents, departments, agencies, and instrumentalities thereof, that challenge, attack, or seek to modify, set aside, void, or annul, the any action of, or any permit or approval issued by, the City and/or any of its officials, officers, employees, agents, departments, agencies, and instrumentalities thereof (including actions approved by the voters of the City), for or concerning the Project (collectively, the "Entitlements"), whether such Actions are brought under the California Environmental Quality Act, the Planning and Zoning Law, the Subdivision Map Act, Code of Civil Procedure Chapter 1085 or 1094.5, the California Public Records Act, or any other state, federal, or local statute, law, ordinance, rule, regulation, or any decision of a court of competent jurisdiction. This condition to indemnify, protect, defend, and hold the City harmless shall include, but not limited to (i) damages, fees and/or costs awarded against the City, if any, and (ii) cost of suit, attorneys' fees and other costs, liabilities and expenses incurred in connection with such proceeding whether incurred by applicant, Property owner, or the City and/or other parties initiating or bringing such proceeding (collectively, subparts (i) and (ii) are the "Damages"). Notwithstanding anything to the contrary contained herein, the Applicant shall not be liable to the City Parties under this indemnity to the extent the Damages incurred by any of the City Parties in such Action(s) are a result of the City Parties' fraud, intentional misconduct or gross negligence in connection with issuing the Entitlements. The applicant shall execute an agreement to indemnify, protect, defend, and hold the City harmless as stated herein within five (5) days of approval of CDP No. 2023-0032.

4. In accordance with the provisions of Government Code Section 66020(d)(1), the imposition of fees, dedications, reservations, or exactions for this Project, if any, are subject to protest by the applicant at the time of approval or conditional approval of the Project or within 90 days after the date of the imposition of the fees, dedications, reservations, or exactions imposed on the Project.

5. The property owner(s) and building tenants shall always abide by all operational mitigation measures contained within the Mitigation Monitoring and Reporting Program associated with the Environmental Impact Report (Environmental Assessment Review No. 2023-0051) adopted for the Project.

6. The tenants within the buildings shall always conduct operations consistent with the environmental analysis contained within the Environmental Impact Report (Environmental Assessment Review No. 2023-0051) adopted for the Project.

7. The Project shall be limited to a maximum of 683 actual passenger car trips and 455 actual truck trips daily, in accordance with Table 5 (Summary of Project Trip Generation) of the Traffic Study prepared for the Project by Kimley-Horn and Associates, Inc. and dated December 2025, which is attached hereto as Exhibit B.

8. The applicant, landlord, and/or tenant(s) shall require all inbound truck traffic to access the site via the SR-210 Freeway & Alder Avenue off-ramps, northbound on Alder Avenue to Casmalia Street, eastbound on Casmalia Street to Locust Avenue, and then northbound on Locust Avenue to the either driveway connected to Locust Avenue, or via the I-15 Freeway & Sierra Avenue off-ramps, southbound on Sierra Avenue to Riverside Avenue, southeastbound on Riverside Avenue to Locust Avenue, and then southbound on Locust Avenue to either driveway connected to Locust Avenue. Inbound truck traffic shall not use Casmalia Street east of Locust Avenue or Riverside Avenue southeast of Locust Avenue.

9. The applicant, landlord, operator(s) and/or tenant(s) shall require all outbound truck traffic to proceed southbound on Locust Avenue to Casmalia Street, then westbound on Casmalia Street to Alder Avenue, then southbound on Alder Avenue to the SR-210 Freeway & Alder Avenue on-ramps, or trucks exiting shall proceed northbound on Locust Avenue to Riverside Avenue, then northwestbound on Riverside Avenue to Sierra Avenue, then northbound on Sierra Avenue to the I-15 Freeway & Sierra Avenue on-ramps.

10. The applicant, landlord, operator(s) and/or tenant(s) shall ensure that all inbound truck traffic that requires temporary queuing or staging do so on-site. Inbound truck traffic shall not queue or stage on any public street at any time. Activities on-site shall not operate in such a manner that would impact traffic lanes, cause back up (queuing or staging) of vehicles into the public-right-of-way, or create any unsafe conditions. Fire and Police access and passage around trucks queuing or staging on-site shall be feasible at all times and activities shall not block parking areas, access or passage for disabled persons or emergency response vehicles.

11. The applicant, landlord, operator(s) and/or tenant(s) shall only park or store trucks and trailers within designated truck and trailer spaces within the truck court and adjacent to the dock doors on the north side of the building. No trucks or trailers shall be parked or stored within any drive-aisles or passenger vehicle parking areas outside of the enclosed truck court at any time.

12. The landlord and/or tenant(s) shall not store any product, goods, materials, etc. outside of the building at any time, except for trucks, trailers, and vehicles associated with the operation(s) conducted within the building, without prior approval of a separate Conditional Development Permit in accordance with Chapter 18.104 (Outdoor Storage Uses) of the Rialto Municipal Code.

13. Approval of CDP No. 2023-0032 will not become effective until the applicant has signed a statement acknowledging awareness and acceptance of the required conditions of approval contained herein.

14. In the event, that any operation on the Site is found to be objectionable or incompatible with the character of the City and its environs due to excessive noise, excessive traffic, loitering, criminal activity or other undesirable characteristics including, but not strictly limited to, uses which are or have become offensive to neighboring property or the goals and objectives of the General Manufacturing (I-GM) land use district of the Rialto Airport Specific Plan and/or the City's General Plan, the applicant shall address the issues within forty-eight (48) hours of being notified by the City.

15. If the applicant fails to comply with any of the conditions of approval placed upon CDP No. 2023-0032, TPM No. 20809, or PPD No. 2023-0041, the Planning Commission may initiate proceedings to revoke the conditional development permit in accordance with the provisions of Sections 18.66.070 through 18.66.090, inclusive, of the Rialto Municipal Code. CDP No. 2023-0032 may be revoked, suspended or modified in accordance with Section 18.66.070 of the Zoning Ordinance at the discretion of the Planning Commission if:

    a) The use for which such approval was granted has ceased to exist, been subsequently modified, or has been suspended for six (6) months or more;

    b) Any of the express conditions or terms of such permit are violated;

    c) The use for which such approval was granted becomes or is found to be objectionable or incompatible with the character of the City and its environs due to excessive noise, excessive traffic, loitering, criminal activity or other undesirable characteristics including, but not strictly limited to uses which are or have become offensive to neighboring property or the goals and objectives of the General Manufacturing (I-GM) land use district of the Rialto Airport Specific Plan and/or the City's General Plan.

SECTION 5. The Chairman of the Planning Commission shall sign the passage and adoption of this resolution and thereupon the same shall take effect and be in force.

PASSED, APPROVED AND ADOPTED this 17th day of December, 2025.

3. ALL DIMENSIONS ARE TO FACE OF CONCRETE PANEL WALL, GRID LINE OR FACE OF STUD UNLESS NOTED OTHERWISE.
4. REFER TO CIVIL DRAWINGS FOR POINT CONNECTION TO OFF-SITE UTILITIES AND CONTRACTOR TO VERIFY ACTUAL UTILITY LOCATIONS.
5. CONTRACTOR TO PROTECT AND KEEP FLOOR SLAB CLEAN. ALL EQUIPMENT TO BE DAMPERED INCLUDING CAKE AND TRUCKS TO PREVENT OIL SPILLS.
6. CONCRETE SLAB TO HAVE STEEL FLOAT TROWEL BURNISHED FINISH.
7. ALL FLOOR SLAB NAIL OR GRACE FRAME HOLES SHALL BE FILLED WITH APPROVED 2 PART EPOXY COMPOUND TO MATCH CONCRETE COLOR.
8. PROVIDE MM-EP 90 AT CONTROL/EXPANSION JOINTS AT THE SPEEDWAY ONLY.

PAINT NOTES

1. INTERIOR CONCRETE WALL: SINGLE COAT OF ACRYLIC PAINT ON INTERIOR WALLS. SHERWIN WILLIAMS, "SNOWBOUND" SW 7004 - FLAT SHEEN.
2. ALL STRUCTURAL STEEL MEMBER INCLUDING COLUMNS, LEDGERS, JOISTS, GIRDERS SHALL RECEIVE LIGHT GRAY SHOP PRIMER. ANY FIELD WELDS SHALL BE TOUCHED UP TO MATCH SHOP PRIMER.
3. STRUCTURAL COLUMNS SHALL, SHALL RECEIVE A COAT OF OSHA YELLOW SAFETY WARNING COLOR. PAINT UP TO 12' ABOVE FINISH FLOOR.
4. ARCHITECTURAL COATINGS REQUIRE USE OF HVLP SPRAYING EQUIPMENT OR MINIMUM TRANSFER RATE OF AT LEAST 50% OR MANUAL APPLICATION TECHNIQUE.
5. PAINT SHALL BE OF "SUPER COMPLIANT" LOW VOC PER SCAQMD RULE 1113.

GENERAL NOTES

1. VERIFY THAT ALL AREAS HAVE A POSITIVE ¼" PER FOOT MIN DRAINAGE PRIOR TO INSTALLATION UNLESS NOTED BY THE STRUCTURAL DRAWINGS.
2. COORDINATE WITH STRUCTURAL DRAWINGS FOR ROOF ELEVATIONS.
3. CONTRACTOR SHALL VERIFY ALL MECHANICAL UNIT LOCATIONS, CURBS AND HOOK UPS WITH SUBCONTRACTORS, MECHANICAL / STRUCTURAL ENGINEERS AND ARCHITECT PRIOR TO INSTALLATION.
4. BEFORE SETTING AND ANCHORING OF ANY ROOF MOUNTED EQUIPMENT CONTRACTOR TO CHECK IF SUCH EQUIPMENT ARE VISIBLE FROM PUBLIC WAY. ALERT THE ARCHITECT IF VISIBLE.
5. PROVIDE INVERTED CAP SHEET CRICKETS ALONG UPPER SLOPE OF ALL SKYLIGHTS, MECHANICAL EQUIPMENT UNITS AND OTHER OPENINGS TO FACILITATE POSITIVE DRAINAGE.
6. WHEN REQUIRED BY LOCAL JURISDICTION AND PRIOR TO TRUSS INSTALLATION, TRUSS MANUFACTURER TO SUBMIT PLANS TO BUILDING DEPARTMENT FOR APPROVAL.
7. CONTRACTOR SHALL INSURE PROPER JOB SITE STORAGE OF MATERIALS TO MINIMIZE EXPOSURE TO MOISTURE DURING THE CONSTRUCTION CYCLE.
8. CONTRACTOR TO VERIFY ALL ROOF DEPRESSIONS PER STRUCTURAL DRAWINGS.
9. REFER TO PLUMBING DRAWINGS FOR ROOF DRAIN AND SIZING.
10. ALL ROOF FASTENERS SHALL MEET ALL LOCAL CODE AND REGULATIONS AND REQUIREMENTS. PROPER REQUIREMENTS ARE IN PROJECT JURISDICTION AND ALSO FACTORY MUTUAL WIND UPLIFT PRESSURE REQUIREMENTS.
11. WHEN APPLICABLE, FLEXIBLE FLASHING FOR SMOKE VENTS SHALL BE CAVE TEMPERATURE RANGE HIGHER THAN THE ESFR SPRINKLER SYSTEM.
12. WHEN APPLICABLE, SIGNAGE STATE SHALL BE REQUIRED IF AREAS FOR "POTENTIAL OFFICES" WILL BE USED FOR HIGH PILE COMMODITIES STORAGE.
13. ROOF DRAINS, OVERFLOW DRAINS AND RAINWATER PIPING WITHIN THE INTERIOR OF THE BUILDING SHALL BE TESTED IN ACCORDANCE WITH THE PROVISIONS OF THE PLUMBING CODE FOR TESTING DRAIN, WASTE, AND VENT SYSTEMS.
14. ROOF DRAINS, OVERFLOW DRAINS AND PIPING WITHIN THE BUILDING SHALL UTILIZE APPROVED DRAINAGE FITTINGS.
15. MANUFACTURE ROOF DRAINS AND OVERFLOWS SHALL BE IAPMO LISTED.
16. REFER TO SSA SHEETS FOR MINIMUM ROOFTOP REQUIREMENT.
17. AT THE END OF CONSTRUCTION, CLEAR ALL CONSTRUCTION DEBRIS ON ROOF AND AROUND ROOF DRAINS AND SCUPPERS.

KEYNOTES

1. CONCRETE PARAPET WALL PER STRUCTURAL. PAINT INSIDE FACE AND TOP OF PARAPET WALL WITH DOMINANT BUILDING COLOR WITH ELASTOMERIC PAINT. TOP OF PARAPET SHALL BE SACKED SMOOTH.
2. CONCRETE PARAPET RETURN.
3. 4 P.Y. CLASS "A" BUILT UP ROOFING. JOHNS MANVILLE 4-ONC OR EQUAL. PROVIDE 15 YEAR NO DOLLAR WARRANTY WITH 25 YEAR ALTERNATE.
4. WHITE SORM UNDER ROOF DECK.
5. STRUCTURAL JOISTS/ORDER BELOW.
6. EXHAUST FAN PER MECHANICAL.
7. MECHANICAL ROOF TOP EQUIPMENT PER MECHANICAL/STRUCTURAL.
8. PLUMBING VENT PIPE PER PLUMBING.
9. 5' WIDE WALK PAD, JOHNS MANVILLE DYNATRED OR EQ.
10. EXTERIOR DOWN SPOUT AND OVERFLOW SCUPPERS.
11. INTERIOR ROOF DRAIN AND OVERFLOW SCUPPERS.
12. INTERIOR ROOF DRAIN AND OVERFLOW DRAIN.
13. ROOF ADDRESS NUMBER, 4ft TEXT, BLACK STENCIL
14. 96" 0.64" ACCESS ROOF HATCH WITH 42" BUILT IN GUARD RAIL.

GENERAL NOTES

1. ALL PAINT COLOR CHANGES TO OCCUR AT INSIDE CORNERS UNLESS NOTED OTHERWISE.
2. ALL PAINT FINISHES ARE TO BE FLAT UNLESS NOTED OTHERWISE.
3. STOREFRONT CONSTRUCTION: GLASS, METAL ATTACHMENTS AND UNITS SHALL BE DESIGNED TO RESIST WIND EXPOSURE "C" WINDS. CONTRACTOR SHALL SUBMIT SHOP DRAWINGS PRIOR TO INSTALLATION.
4. TOP AND BACK SIDE OF PARAPETS TO HAVE SMOOTH SACKED FINISH AND BE PAINTED WITH ELASTOMERIC PAINT.
5. FOR SPANDRELS: GLAZING, ALLOW SPACE BEHIND SPANDREL TO BREATH BY PROVIDING A MINIMUM 8" DIAMETER HOLE ON THE CORNER. DO NOT CORE DRILL. USE PVC PIPE DURING CASTING OF CONCRETE PANEL. REMOVE PVC AND SACK SMOOTH AND MANHOLE.
6. USE ADHESIVE BACK WOOD STRIPS FOR ALL REVEAL FORMS
7. PROVIDE SINGLE COAT OF PRIMER (MOLLER) ON PCI COVER UP WITH FIRST COAT OF PAINT TO BE ROLLED ON AND THE SECOND COAT TO BE SPRAYED ON. PROVIDE THIRD LAYER REQUIRED TO ACHIEVE FULL COLOR SATURATION AS REQUIRED.
8. WATER BLAST EXTERIOR FACE OF BUILDING WALLS PRIOR TO PAINT.
9. ALL CONCRETE PANEL JOINTS SHALL BE CLEARED OF DEBRIS BY PRESSURING WASHING THE CAVITY. GRIND ANY SHARP EDGES PRIOR TO APPLY PANEL CAULK JOINT.
10. ALL EXTERIOR DOORS AND LOUVERS SHALL BE FABRICATED AND WEATHER STRIPPED TO WITHSTAND WIND EXPOSURE "C"
11. CONTRACTOR TO PROVIDE MOCK UP PAINT AND FINISHES FOR OWNER AND ARCHITECTS APPROVAL PRIOR TO COMMENCING THE WORK.
12. ALL FINISH MATERIAL SUCH AS ADHESIVES, SEALANTS, PRIMERS AND CAULKS SHALL COMPLY WITH LOCAL OR REGIONAL AIR POLLUTION CONTROL OR AIR QUALITY MANAGEMENT DISTRICT RULES WHERE APPLICABLE. OR SCAQMD RULE 1168 VOC LIMIT IS AS SHOWN ON TABLE 5.504.4.1 AND 5.504.4.2. SUCH PRODUCTS ALSO SHALL COMPLY WITH RULE 1168 PROHIBITION ON THE USER OF CERTAIN TOXIC COMPOUNDS (CHLORODFORM, DICHLOROMETHANE, METHYLENE CHLORIDE, PERCHLOROETHYLENE AND TRICHLOROTHRIFLUOROETHANE), EXCEPT FOR AEROSOL PRODUCTS AS SPECIFIED IN SECTION 5.504.4.2.3 BELOW.
13. AEROSOL ADHESIVES AND SMALLER UNIT SIZES OF ADHESIVES AND SEALANT OR CAULKING COMPOUNDS (IN UNITS OF PRODUCTS, LESS PACKAGING, WHICH DO NOT WEIGH MORE THAN ONE POUND AND DO NOT CONSIST OF MORE THAN 16 FLUID OUNCES SHALL COMPLY WITH STATE AND FEDERAL VOC STANDARDS AND OTHER REQUIREMENTS, INCLUDING PROHIBITIONS ON USE OF CERTAIN TOXIC COMPOUNDS.

NORTHEAST ELEVATION — SCALE 1/16" = 1'-0" — 3

SOUTHEAST ELEVATION — SCALE 1/16" = 1'-0" — 4

GENERAL NOTES

1. ALL PAINT COLOR CHANGES TO OCCUR AT INSIDE CORNERS UNLESS NOTED OTHERWISE.
2. ALL PAINT FINISHES ARE TO BE FLAT UNLESS NOTED OTHERWISE
3. STOREFRONT CONSTRUCTION: GLASS, METAL ATTACHMENTS AND UNITS SHALL BE DESIGNED TO RESIST WIND EXPOSURE "C" WINDS. CONTRACTOR SHALL SUBMIT SHOP DRAWINGS PRIOR TO INSTALLATION.
4. TOP AND BACK SIDE OF PARAPETS TO HAVE SMOOTH SACKED FINISH AND BE PAINTED WITH FLAT ACRYLIC PAINT.
5. FOR SPANDREL GLAZING, ALLOW SPACE BEHIND SPANDREL TO BREATH BY PROVIDING A MINIMUM 2" DIAMETER HOLE IN THE CORNER, DO NOT CORK OR ILL; USE PVC PIPE DURING CASTING OF CONCRETE PANEL, REMOVE PVC AND SACK SMOOTH AND OWNSIDES.
6. USE ADHESIVE BACK WOOD STRIPS FOR ALL REVEAL FORMS.
7. PROVIDE SMALL COAT OF PRIMER ROLLED ON / FOLLOWED UP WITH FIRST COAT OF PAINT TO BE ROLLED-ON AND THE SECOND COAT TO BE SPRAYED ON. PROVIDE THREE (THREE-ROUNDED) TO MATCH FULL COLOR SATURATION AS REQUIRED.
8. WATER BLAST EXTERIOR FACE OF BUILDING WALLS PRIOR TO PAINT.
9. ALL CONCRETE PANEL JOINTS SHALL BE CLEANED OF DEBRIS BY PRESSURING WASHING THE CAVITY. GRIND ANY SHARP EDGES PRIOR TO APPLY PANEL CAULK JOINT.
10. ALL EXTERIOR DOORS AND LOUVERS SHALL BE FABRICATED AND WEATHER STRIPPED TO WITHSTAND WIND EXPOSURE "C"
11. CONTRACTOR TO PROVIDE MOCK UP PAINT AND FINISHES FOR OWNER AND ARCHITECT'S APPROVAL PRIOR TO COMMENCING THE WORK.
12. ALL FINISH MATERIAL SUCH AS ADHESIVES, SEALANTS, PRIMERS AND CAULKS SHALL COMPLY WITH LOCAL OR REGIONAL AIR POLLUTION CONTROL OR AIR QUALITY MANAGEMENT DISTRICT RULES WHERE APPLICABLE, OR SCAQMD RULE 1168 VOC LIMITS AS SHOWN ON TABLE 5.504.4.1 AND 5.504.4.2. SUCH PRODUCTS ALSO SHALL COMPLY WITH RULE 1168 PROHIBITION ON THE USER OF CERTAIN TOXIC COMPOUNDS (DICHLORINATED ETHYLENE DICHLORIDE, METHYLENE CHLORIDE, PERCHLOROETHYLENE AND TRICHLOROETHYLEE) EXCEPT FOR AEROSOL PRODUCTS AS SPECIFIED IN RR1168
13. AEROSOL ADHESIVES AND SMALLER UNIT SIZES OF ADHESIVES, AND SEALANT OR CAULKING COMPOUNDS (IN UNITS OF PRODUCTS, LESS PACKAGING, WHICH DO NOT WEIGH MORE THAN ONE POUND AND DO NOT CONSIST OF MORE THAN 16 FLUID OUNCES) SHALL COMPLY WITH STATE, FEDERAL VOC STANDARDS AND OTHER REQUIREMENTS, INCLUDING PROHIBITIONS ON USE OF CERTAIN TOXIC COMPOUNDS.

KEYNOTES

1. CONCRETE TILT UP WALL - SEE PAINT AND FINISH LEGEND 9/01.0/W. WATERPROOF ALL WALLS WHERE GRADE IS HIGHER AND EXPOSED TO THE WEATHER. USE SIDE, WATER PROOFING TO BE PROTECTED WITH PROTECTION BOARD AND A MINIMUM OF 9" OF GRAVEL. PROVIDE TRENCH DRAIN AT BOTTOM AND DAYLIGHT TO CURB OR TAKE TO STORM DRAIN.
2. CONCRETE TILT PANEL JOINT - DETAIL 2/A5.02 AND NOTE 10 IN GENERAL NOTES
3. PAINTED CONCRETE REVEAL - DETAIL 1/A5.02

RESOLUTION NO. 2025-XX

A RESOLUTION OF THE PLANNING COMMISSION OF THE CITY OF RIALTO, CALIFORNIA RECOMMENDING THAT THE CITY COUNCIL APPROVE PRECISE PLAN OF DESIGN NO. 2023-0041 ALLOWING THE DEVELOPMENT OF A 664,859 SQUARE FOOT INDUSTRIAL WAREHOUSE BUILDING WITH ASSOCIATED PAVING, LANDSCAPING, FENCING, LIGHTING, AND DRAINAGE IMPROVEMENTS ON 38.89 GROSS ACRES (38.78 NET ACRES) OF LAND (APN: 0239-192-23) LOCATED AT THE SOUTHWEST CORNER OF LOCUST AVENUE AND LOWELL STREET WITHIN THE GENERAL MANUFACTURING (I-GM) LAND USE DISTRICT OF THE RIALTO AIRPORT SPECIFIC PLAN.

WHEREAS, the applicant, IV5 Locust Gateway Logistics Center LLC, ("Applicant") proposes to develop a 664,859 square foot industrial warehouse building with associated paving, landscaping, fencing, lighting, and drainage improvements ("Project") on approximately 38.89 gross acres (38.78 net acres) of land (APN: 0239-192-23) located at the southwest corner of Locust Avenue and Lowell Street within the General Manufacturing (I-GM) land use district of the Rialto Airport Specific Plan ("Site"); and

WHEREAS, the Project will consist of a 664,859 square foot industrial warehouse building, eighty-two (82) dock-high loading doors, concrete screen walls, an abundant amount of landscaping, and full pedestrian and vehicle access; and

WHEREAS, Pursuant to Chapter 18.65 (Precise Plan of Design) of the Rialto Municipal Code, the Project requires a Precise Plan of Design, and the applicant agreed to apply for Precise Plan of Design No. 2023-0041 ("PPD No. 2023-0041"); and

WHEREAS, in conjunction with the Project, the applicant has applied for Tentative Parcel Map No. 2023-0006, also referred to as Tentative Parcel Map No. 20809 ("TPM No. 20809") to provide public right-of-way dedications and to resolve underlying past recordings and instruments related to the Site; and

WHEREAS, in conjunction with the Project, the applicant has applied for Conditional Development Permit No. 2023-0032 ("CDP No. 2023-0032") to facilitate the development and operation of a 664,859 square foot industrial warehouse building on the Site; and

WHEREAS, on December 17, 2025, the Planning Commission of the City of Rialto conducted a duly noticed public hearing, as required by law, on PPD No. 2023-0041, TPM No. 20809, and CDP No. 2023-0032, took testimony, at which time it received input from staff, the city attorney, and the applicant; heard public testimony; discussed the proposed PPD No. 2023-0041, TPM No. 20809, and CDP No. 2023-0032; and closed the public hearing; and

WHEREAS, all legal prerequisites to the adoption of this Resolution have occurred.

NOW, THEREFORE, BE IT RESOLVED by the Planning Commission of the City of Rialto as follows:

SECTION 1. The Planning Commission hereby specifically finds that all of the facts set forth in the recitals above of this Resolution are true and correct and incorporated herein.

SECTION 2. Based upon the forgoing and substantial evidence presented to the Planning Commission during the public hearing conducted with regard to PPD No. 2023-0041, including, but not limited to, written staff reports, verbal testimony, presentations by City staff, site plans, other supporting documents, and the conditions of approval stated herein, the Planning Commission hereby determines that PPD No. 2023-0041 satisfies the requirements of Section 18.65.020E of the Rialto Municipal Code pertaining to the findings which must be made precedent to granting a Precise Plan of Design. The findings are as follows:

1. The proposed development is in compliance with all city ordinances and regulations, unless in accordance with an approved variance; and

This finding is supported by the following facts:

The Site has a General Plan land use designation of General Industrial with a Specific Plan Overlay and a zoning designation of Rialto Airport Specific Plan. The Site's land use designation within the Rialto Airport Specific Plan is General Manufacturing (I-GM). Those designations allow for the development and operation of industrial warehouse buildings, as proposed by the Project. The Project, as conditioned herein, will comply with all City ordinances and regulations, including those required by the General Manufacturing (I-GM) land use district of the Rialto Airport Specific Plan and the City's Design Guidelines. Additionally, the Project meets all the required development standards of the I-GM land use district of the Rialto Airport Specific Plan and Chapter 18.112 (Indoor Storage Facilities) of the Rialto Municipal Code including, but not limited to, required building setbacks, parking, landscaping, building height, floor area ratio, etc.

2. The site is physically suitable for the proposed development, and the proposed development will be arranged, designed, constructed, and maintained so that it will not be unreasonably detrimental or injurious to property, improvements, or the health, safety or general welfare of the general public in the vicinity, or otherwise be inharmonious with the city's general plan and its objectives, zoning ordinances or any applicable specific plan and its objectives; and

This finding is supported by the following facts:

The Site is 38.89 gross acres (38.78 net acres) in size, bound by two (2) public street (Locust Avenue to the east and Lowell Street to the north), and is within the General Manufacturing (I-GM) land use district of the Rialto Airport Specific Plan. To the north of the project site, across Lowell Street, are several existing industrial developments, and to the east, across Locust Avenue, is approximately 4.75 acres of vacant land. To the south are several existing industrial developments, and to the west is a concrete mix manufacturing facility operated by Robertson's Ready Mix. The nearby area is predominantly designated for and developed with industrial uses, and as a result, there are no sensitive land uses adjacent to the project site. The project is not expected to negatively impact any uses with the successful implementation of measures such as landscape buffering, the installation of solid screen walls, aesthetic building enhancements, and other traffic related measures.

3. The proposed development will not unreasonably interfere with the use or enjoyment of neighboring property rights or endanger the peace, health, safety or welfare of the general public; and

This finding is supported by the following facts:

The Project's effects will be minimized through the implementation of the Conditions of Approval contained herein, such as extensive landscaping, concrete screen walls, decorative paving, and enhanced architectural features. To the north of the project site, across Lowell Street, are several existing industrial developments, and to the east, across Locust Avenue, is approximately 4.75 acres of vacant land. To the south are several existing industrial developments, and to the west is a concrete mix manufacturing facility operated by Robertson's Ready Mix. The nearby area is predominantly designated for and developed with industrial uses, and as a result, there are no sensitive land uses adjacent to the project site. The project is not expected to negatively impact any uses with the successful implementation of measures such as landscape buffering, the installation of solid screen walls, aesthetic building enhancements, and other traffic related measures.

4. The proposed development will not substantially interfere with the orderly or planned development of the City of Rialto.

This finding is supported by the following facts:

The Project is consistent with the underlying General Manufacturing (I-GM) land use district of the Rialto Airport Specific Plan and is a logical addition to the existing industrial developments surrounding the Site. The design of the Project will ensure a continuation of the public improvements and aesthetics present in the surrounding area. The City staff have reviewed the design of the Project to ensure compliance with all health, safety, and design requirements to ensure the Project will enhance the infrastructure and aesthetics of the local community.

SECTION 3. An Environmental Impact Report (Environmental Assessment Review No. 2023-0051) has been prepared for the proposed Project in accordance with the California Environmental Quality Act (CEQA) and it has been determined that the Project will create unavoidable significant impacts to greenhouse gas emissions. On December 17, 2025, by Resolution No. _____, the Planning Commission recommended that the City Council certify the above-reference Environmental Impact Report, make certain findings, and adopt a Statement of Overriding Considerations and a Mitigation Monitoring and Reporting Plan, which Resolution No. _____ together with the above-referenced Environmental Impact Report are incorporated herein by reference. The Planning Commission further finds that the PPD No. 2023-0041 is within the scope of the above-referenced Environmental Impact Report. Accordingly, the Planning Commission has forwarded, or is forwarding, a recommendation to the City Council to adopt the Environmental Impact Report prepared for the Project.

SECTION 4. Based upon the forgoing and substantial evidence presented to the Planning Commission during the public hearing conducted with regard to PPD No. 2023-0041, including, but not limited to, written staff reports, verbal testimony, presentations by City staff, site plans, other supporting documents, and the conditions of approval stated herein, the Planning Commission hereby recommends that the City Council approve PPD No. 2023-0041, in accordance with the plans and application on file with the Planning Division, subject to the following Conditions of Approval:

1. The applicant is granted PPD No. 2023-0041 allowing the development of a 664,859 square foot industrial warehouse building with associated paving, landscaping, fencing, lighting, and drainage improvements on 38.89 gross acres (38.78 net acres) of land (APN: 0239-192-23) located at the southwest corner of Locust Avenue and Lowell Street within the General Manufacturing (I-GM) land use district of the Rialto Airport Specific Plan, subject to the Conditions of Approval contained herein.

2. The approval of PPD No. 2023-0041 is granted for a five (5) year period from the date of approval. Approval of PPD No. 2023-0041 will not become effective until the applicant has signed a Statement of Acceptance acknowledging awareness and acceptance of the required Conditions of Approval contained herein. Any request for an extension shall be reviewed by the Community Development Director and shall be based on the progress that has taken place toward the development of the project.

3. The development associated with PPD No. 2023-0041 shall conform to the site plan, fence and wall plan, floor plan, roof plan, elevations, conceptual grading and drainage plans, conceptual utility plans, and the concept landscape plan attached hereto as Exhibit A, except as may be required to be modified based on the Conditions of Approval contained herein.

4. The development associated with PPD No. 2023-0041 shall comply with all Conditions of Approval contained within CDP No. 2023-0032.

5. The development associated with PPD No. 2023-0041 shall comply with all applicable sections of the Rialto Airport Specific Plan, the Rialto Municipal Code, and all other applicable State and local laws and ordinances.

6. City inspectors shall have access to the site to reasonably inspect the site during normal working hours to assure compliance with these conditions and other codes.

7. The applicant shall indemnify, protect, defend, and hold harmless, the City of Rialto, and/or any of its officials, officers, employees, agents, departments, agencies, and instrumentalities thereof (collectively, the "City Parties"), from any and all claims, demands, law suits, writs of mandamus, and other actions and proceedings (whether legal, equitable, declaratory, administrative or adjudicatory in nature), and alternative dispute resolutions procedures (including, but not limited to arbitrations, mediations, and other such procedures), (collectively "Actions"), brought against the City, and/or any of its officials, officers, employees, agents, departments, agencies, and instrumentalities thereof, that challenge, attack, or seek to modify, set aside, void, or annul, the any action of, or any permit or approval issued by, the City and/or any of its officials, officers, employees, agents, departments, agencies, and instrumentalities thereof (including actions approved by the voters of the City), for or concerning the Project (collectively, the "Entitlements"), whether such Actions are brought under the California Environmental Quality Act, the Planning and Zoning Law, the Subdivision Map Act, Code of Civil Procedure Chapter 1085 or 1094.5, the California Public Records Act, or any other state, federal, or local statute, law, ordinance, rule, regulation, or any decision of a court of competent jurisdiction. This condition to indemnify, protect, defend, and hold the City harmless shall include, but not be limited to (i) damages, fees and/or costs awarded against the City, if any, and (ii) cost of suit, attorneys' fees and other costs, liabilities and expenses incurred in connection with such proceeding whether incurred by applicant, Property owner, or the City and/or other parties initiating or bringing such proceeding (collectively, subparts (i) and (ii) are the "Damages"). Notwithstanding anything to the contrary

contained herein, the Applicant shall not be liable to the City Parties under this indemnity to the extent the Damages incurred by any of the City Parties in such Action(s) are a result of the City Parties' fraud, intentional misconduct or gross negligence in connection with issuing the Entitlements. The applicant shall execute an agreement to indemnify, protect, defend, and hold the City harmless as stated herein within five (5) days of approval of PPD No. 2023-0041.

8. In accordance with the provisions of Government Code Section 66020(d)(1), the imposition of fees, dedications, reservations, or exactions for this Project, if any, are subject to protest by the applicant at the time of approval or conditional approval of the Project or within 90 days after the date of the imposition of the fees, dedications, reservations, or exactions imposed on the Project.

9. The applicant shall secure the services of a tribal cultural monitor to be present during all ground disturbance activities associated with the construction of this project. The tribal cultural monitor shall be approved by the Gabrieleño Band of Mission Indians-Kizh Nation, and documentation of coordination between the applicant and the Gabrieleño Band of Mission Indians-Kizh Nation on this matter shall be provided to the Planning Division prior to the issuance of a grading permit.

10. The applicant shall install decorative pavement within each driveway connected to Locust Avenue and Lowell Street. The decorative pavement shall extend across the entire width of each driveway and shall have a minimum depth of twenty-five (25) feet as measured from the property line along each respective street. Decorative pavement means decorative pavers and/or color concrete with patterns and color variety. The decorative pavement shall include a concrete border with a broom finish and a minimum width of twelve (12) inches. The location of the decorative pavement shall be identified on the Precise Grading Plan prior to the issuance of a grading permit. Additionally, the location and type of decorative pavement shall be identified on the formal Landscape Plan submittal, and other on-site improvement plans, prior to the issuance of building permits.

11. In order to provide enhanced building design in accordance with Chapter 18.61 (Design Guidelines) of the Rialto Municipal Code, the applicant shall route all drainage downspouts through the interior of the building. The internal downspouts shall be identified within the formal building plan check submittal prior to the issuance of building permits.

12. In order to provide enhanced building design in accordance with Chapter 18.61 (Design Guidelines) of the Rialto Municipal Code, the applicant shall construct parapet returns, at least three (3) feet in depth from the main wall plane, at all height variations on all four (4) sides of each building. The parapet returns shall be demonstrated on the roof plans within the formal building plan check submittal prior to the issuance of building permits.

13. In order to provide enhanced building design in accordance with Chapter 18.61 (Design Guidelines) of the Rialto Municipal Code, the applicant shall provide internal roof access only for each building. The internal roof access shall be identified within the formal building plan check submittal prior to the issuance of building permits.

14. In order to provide enhanced site design in accordance with Chapter 18.61 (Design Guidelines) of the Rialto Municipal Code, new walls visible from the public right-of-way, including any retaining walls, shall be comprised of decorative masonry block or decorative concrete. Decorative masonry block means tan-colored slumpstone block, tan-colored split-face block, or precision block with a stucco, plaster, or cultured stone finish. Decorative concrete means painted concrete with patterns, reveals, and/or trim lines. Pilasters shall be incorporated within all new walls visible from the public right-of-way. The pilasters shall be spaced a maximum of seventy (70) feet on-center and shall be placed at all corners and ends of the wall. All pilasters shall protrude a minimum of six (6) inches above the wall and have a depth and width of at least three (3) feet. All decorative masonry walls and pilasters, including retaining walls, shall include a decorative masonry cap. All walls and pilasters shall be identified on the site plan and Precise Grading Plan, and an elevation detail for the walls shall be included in the formal building plan check submittal prior to the issuance of building permits.

15. The screen wall surrounding the truck court shall be setback a minimum of twenty (20) feet from the ultimate property line along Locust Avenue, in accordance with Table 9 (Development Standards Non-Residential Designations) of the Rialto Airport Specific Plan. The location of the screen wall shall be identified on the Precise Grading Plan prior to issuance of a grading permit and within the formal building plan check submittal prior to the issuance of building permits. The required decorative pilasters along the wall may encroach into this setback.

16. The screen wall surrounding the truck court shall be setback a minimum of twenty (20) feet from the back of sidewalk along Lowell Street, in accordance with Table 9 (Development Standards Non-Residential Designations) of the Rialto Airport Specific Plan. The location of the screen wall shall be identified on the Precise Grading Plan prior to issuance of a grading permit and within the formal building plan check submittal prior to the issuance of building permits. The required decorative pilasters along the wall may encroach into this setback.

17. The required ten (10) foot landscape setback along the west side of the Site shall be kept free and clear of any fencing and/or retaining walls that would prevent the planting of trees, shrubs, and groundcover.

18. In order to provide enhanced building design in accordance with Chapter 18.61 (Design Guidelines) of the Rialto Municipal Code, any new fencing installed on site shall be comprised of tubular steel. Decorative masonry or decorative concrete pilasters, with a minimum dimension of thirty-six (36) inch square, shall be incorporated within all new fencing visible from any public right-of-way. Decorative masonry block means tan slumpstone block, tan split-face block, or precision block with a stucco, plaster, or

cultured stone finish. Decorative concrete means painted concrete with patterns, reveals, and/or trim lines. The pilasters shall be spaced a maximum of seventy (70) feet on-center and shall be placed at all corners and ends of the fencing. All decorative masonry pilasters shall include a decorative masonry cap. All fencing and pilasters shall be identified on the site plan, and an elevation detail for the fencing and pilasters shall be included in the formal building plan check submittal prior to the issuance of building permits.

19. The applicant shall install solid or louvered metal gates at each entry of the truck court that is connected directly to Locust Avenue and Lowell Street for the purpose of screening trucks and trailers within the truck court, prior to the issuance of a Certificate of Occupancy. The new gates shall have a minimum height of eight (8) feet and shall be painted black or a color matching the color of the adjoining wall. The new gates shall be identified on the site plan, and an elevation detail for the gate shall be included in the formal building plan check submittal prior to the issuance of building permits.

20. The applicant shall construct at least one (1) ADA accessible trash enclosure on the project site. The trash enclosure(s) shall provide room for one (1) commercial waste container and one (1) commercial recycling container. The exterior of each trash enclosure shall be comprised of decorative masonry block or decorative concrete. Decorative masonry block means tan-colored slumpstone block, tan-colored split-face block, or precision block with a stucco, plaster, or cultured stone finish. Decorative concrete means painted concrete with patterns, reveals, and/or trim lines. Additionally, each trash enclosure shall contain solid steel doors and a flat solid cover. Corrugated metal and chain-link are not acceptable materials to use as a part of the trash enclosure. The location of each trash enclosure shall be identified on the site plan within the formal building plan check prior to the issuance of building permits. An elevation detail for the trash enclosure(s) shall be provided within formal building plan check submittal prior to the issuance of building permits.

21. All light standards installed on site, shall have a maximum height of twenty-eight (28) feet, as measured from the finished surface, including the base. Lighting shall be shielded and/or directed toward the site so as not to produce direct glare or "stray light" onto adjacent properties. All light standards shall be identified on the site plan and a note indicating the height restriction shall be included within the formal building plan check submittal prior to the issuance of building permits.

22. The applicant shall submit a formal Landscape Plan to the Planning Division prior to the issuance of building permits. The submittal shall include three (3) sets of planting and irrigation plans, a completed Landscape Plan Review application, and the applicable review fee.

23. The applicant shall plant one (1) tree every three (3) vehicle parking spaces. All parking lot trees shall be a minimum of fifteen (15) gallons in size, upon initial planting. Thereafter, the parking lot trees shall be permanently irrigated and maintained. All parking lot tree species shall consist of evergreen broadleaf trees. The trees shall be

identified on the formal Landscape Plan submittal prior to the issuance of a landscape permit.

24. The applicant shall plant one (1) tree every thirty (30) feet on-center within the on-site landscape setbacks along Locust Avenue and Lowell Street. All trees within the landscape setback shall be a minimum of twenty-four (24) inch box in size, upon initial planting. Thereafter, the trees within the landscape setback shall be permanently irrigated and maintained by the property owner. At least fifty (50) percent of the trees within the setbacks shall consist of evergreen broadleaf trees, while the remaining percentage may consist of broadleaf deciduous trees and/or palm trees. The trees shall be identified on the formal Landscape Plan submittal prior to the issuance of a landscape permit.

25. The applicant shall plant one (1) tree every thirty (30) feet on-center within the public right-of-way parkway along Locust Avenue. All trees within the public right-of-way parkway shall be a minimum of twenty-four (24) inch box in size, upon initial planting. Thereafter, the trees within the public right-of-way parking shall be permanently irrigated and maintained, as required by the Public Works Department. The street tree species along Locust Avenue shall be the Robinina Idahoensis "Idaho Locust". The street trees shall be identified on the formal Landscape Plan submittal prior to the issuance of a landscape permit.

26. The applicant shall plant one (1) tree every thirty (30) feet on-center within the public right-of-way parkway along Lowell Street. All trees within the public right-of-way parkway shall be a minimum of twenty-four (24) inch box in size, upon initial planting. Thereafter, the trees within the public right-of-way parking shall be permanently irrigated and maintained, as required by the Public Works Department. The street tree species along Lowell Street shall be the Pistachia Chinensis "Chinese Pistache" and/or the Geijera Parviflora "Australian Willow". The street trees shall be identified on the formal Landscape Plan submittal prior to the issuance of a landscape permit.

27. The applicant shall plant shrubs and/or construct solid decorative walls that surround all ground mounted equipment and utility boxes, including transformers, fire-department connections, backflow devices, etc. for the purpose of providing screening of said equipment and utility boxes from public view. All equipment and utility box screen shrubs shall be a minimum of five (5) gallons in size upon initial planting, and the shrubs shall be spaced no more than three (3) feet on-center. Thereafter, the equipment and utility box screen shrubs shall be permanently irrigated and maintained into a continuous box-shape with a height of no less than three and one-half (3.5) feet above the finished grade. Solid decorative walls means tan-colored slumpstone block, tan-colored split-face block, or precision block with a stucco, plaster, or cultured stone finish. The shrubs and/or solid walls shall be identified on the formal Landscape Plan submittal prior to the issuance of a landscape permit.

28. The applicant shall plant trees, shrubs, and groundcover throughout all land on-site and off-site (adjacent to the project site) that is not covered by structures, walkways, parking

areas, and driveways, as approved by the Planning Division, unless specified otherwise herein. Trees shall be planted a minimum of thirty (30) feet on-center, and all shrubs and groundcover shall be planted an average of three (3) feet on-center or less, or as approved by the Planning Division. All trees shall be minimum of fifteen (15) gallons in size upon initial planting, unless otherwise specified herein. At least fifty (50) percent of the trees shall consist of evergreen broadleaf trees, while the remaining percentage may consist of broadleaf deciduous trees and/or palm trees. All shrubs shall be a minimum of one (1) gallon in size, unless otherwise specified herein. All planter areas shall receive a minimum two (2) inch thick layer of brown bark, organic mulch, and/or decorative rock upon initial planting. Pea gravel and decomposed granite are not acceptable materials to use within planter areas. All planter areas on-site shall be permanently irrigated and maintained. The planting and irrigation shall be identified on the formal Landscape Plan submittal prior to the issuance of a landscape permit.

29. All planting and irrigation shall be installed on-site in accordance with the approved landscape plans and permit prior to the issuance of a Certificate of Occupancy. The installation of the planting and irrigation shall be certified in writing by the landscape architect responsible for preparing the landscape plans prior to the issuance of a Certificate of Occupancy.

30. Any tubular steel fencing and/or sliding gates shall be painted black prior to the issuance of a Certificate of Occupancy, unless specified otherwise herein.

31. All non-glass doors shall be painted to match the color of the adjacent wall prior to the issuance of a Certificate of Occupancy.

32. The applicant shall comply with all conditions of approval for PPD No. 2023-0041 to the satisfaction of the City Engineer, prior to the issuance of a Certificate of Occupancy, unless otherwise noted herein.

33. All improvements and/or dry utility improvement construction within the public right-of-way require a City of Rialto Encroachment Permit.

34. All abandoned utilities within the public right-of-way shall be completely removed unless otherwise approved to be abandoned in place, as coordinated with and authorized by the City of Rialto Engineering Department. All abandoned utilities within private property may be abandoned in place so long as they do not interfere with construction of the proposed development or fall within the proposed building footprint.

35. The applicant shall pay all applicable development impact fees in accordance with the current City of Rialto fee ordinance, including any Traffic Fair Share Contribution fees, prior to the issuance of any building permit related to the Project, or as otherwise set forth in the Development Agreement between the City of Rialto and the Applicant.

36. The applicant shall pay a fair-share fee in the amount of $364,699, in accordance with Table 19 (Traffic Impact Improvement Costs) of the Transportation Impact Study

prepared for the Project by Kimley-Horn and Associates, Inc. and dated December 2025, prior to the issuance of any building permit for the Project, or as otherwise set forth in the Development Agreement between the City of Rialto and the Applicant. The fair-share amount shall be subject to the California Construction Cost Index (CCCI) for escalation of construction costs. Alternatively, an engineer's cost estimate for the public improvements may be submitted to the Engineering Division for review and approval by the City Engineer. The table below identifies the fair-share fees:

Estimated Fair Share for Traffic Mitigation Improvements	
Locust Avenue and Casa Grande Drive – Participate in the construction of a traffic signal. (30.8% impact) $1,012,000 x .308 = $311,696.00	$311,696
Casmalia Street and Locust Avenue – Participate in the construction of extending the eastbound left-turn lane (28.2% impact) $170,224 x .282 = $48,003.00	$48,003
Locust Avenue and Lowell Street – Participate in the restriping of the eastbound and northbound approaches.	$5,000
Total	$364,699

37. The applicant shall submit civil engineering design plans, reports and/or documents, prepared by a registered/licensed civil engineer, for review and approval by the City Engineer per the current submittal requirements, prior to the indicated threshold or as required by the City Engineer. The first submittal shall consist of, but is not necessarily limited to, the following:

    a. PARCEL MAP (recordation prior to building permit issuance)

    b. PRECISE GRADE W/ EROSION CONTROL PLAN (prior to grading permit issuance)

    c. PUBLIC IMPROVEMENT PLANS – Plans may include: Street, Signing & Striping, Landscape & Irrigation, Sewer, Water, Streetlight etc. (prior to Map approval or off-site construction permit issuance, whichever occurs first)

    d. FINAL DRAINAGE STUDY (prior to grading plan approval)

    e. FINAL WQMP (prior to grading plan approval)

    f. LEGAL DOCUMENTS (e.g. EASEMENT(S), DEDICATION(S), LOT LINE ADJUSTMENT, VACATION, etc.) (prior to Building Permit Issuance or Occupancy Release) – These items are not required to be submitted if they are included on the Parcel Map.

    g. AS-BUILT/RECORD DRAWINGS for all plans (prior to occupancy release)

38. The applicant is responsible for requesting address assignment from the Planning Division for any new building, irrigation water meter and electrical pedestal. Addresses for irrigation meters must be based upon approved civil plans. Addresses for electrical pedestals must be based upon approved SCE plans. The main building address shall be included on Precise Grading Plans and Building Plan set along with the PPD number. The electrical meter pedestal addresses (single or dual) shall be included in the public improvement plans.

39. Upon approval of any improvement plan by the City Engineer, the applicant shall provide the improvement plan to the City in digital format, consisting of a DWG (AutoCAD drawing file), DXF (AutoCAD ASCII drawing exchange file), and PDF (Adobe Acrobat) formats. Variation of the type and format of the digital data to be submitted to the City may be authorized, upon prior approval by the City Engineer.

40. The applicant shall construct asphalt concrete paving for streets in two separate lifts. The final lift paving may occur once all heavy construction traffic has been substantially completed to the satisfaction of the City Engineer, or when onsite building construction has reached 90% completion, whichever occurs first. Paving streets in one lift prior to completion of on-site construction will not be allowed unless prior authorization has been obtained from the City Engineer. Completion of asphalt concrete paving for streets prior to completion of on-site construction activities, if authorized by the City Engineer, will require additional paving requirements prior to acceptance of the street improvements, including, but not limited to: removal and replacement of damaged asphalt concrete pavement, overlay, slurry seal, or other repairs, as required by the City Engineer.

41. The applicant shall repair all street cuts for utilities in accordance with City Standard SC-231 within 72 hours of completion of the utility work; and any interim trench repairs shall consist of compacted backfill to the bottom of the pavement structural section followed by placement of standard base course material in accordance with the Standard Specifications for Public Work Construction ("Greenbook"). The base course material shall be placed the full height of the structural section to be flush with the existing pavement surface and provide a smooth pavement surface until permanent cap paving occurs using an acceptable surface course material.

42. The applicant shall backfill and/or repair all utility trenches or other excavations within existing asphalt concrete pavement of off-site streets resulting from the proposed development, in accordance with City of Rialto Standard Drawings. The applicant shall be responsible for removing, grinding, paving and/or overlaying existing asphalt concrete pavement of off-site streets including pavement repairs in addition to pavement repairs made by utility companies for utilities installed for the benefit of the proposed development (i.e. West Valley Water District, Southern California Edison, Southern California Gas Company, Spectrum, Verizon, etc.). Multiple excavations, trenches, and other street cuts within existing asphalt concrete pavement of off-site streets resulting from the proposed development may require complete grinding and asphalt concrete

overlay of Locust Avenue and Lowell Street, at the discretion of the City Engineer. The pavement condition of the existing off-site streets shall be returned to a condition equal to or better than what existed prior to construction of the proposed development.

43. A separate Off-Site Construction Permit is required for each type of improvement within the public right-of-way, including street, wet utility (RWS only), and landscape and irrigation. To expedite and coordinate all improvements in the public right-of-way, the applicant shall submit a multi-phase master traffic control plan that includes all phases of construction (e.g., sewer, water, overhead, underground, etc.) prior to permit issuance. For simplicity, the Off-Site Construction Permits will replace individual Encroachment Permits typically obtained by the applicant's contractor.

44. In accordance with Chapter 15.32 of the City of Rialto Municipal Code, all existing and new electrical distribution lines of sixteen thousand volts or less and overhead service drop conductors, and all telephone, television cable service, and similar service wires or lines, which are on-site, abutting, and/or transecting, shall be installed underground. Utility undergrounding shall extend to the nearest off-site power pole, or as otherwise set forth within Southern California Edison's approved final design. This may require undergrounding beyond the project limits to prevent any existing poles to remain or new poles to be placed for guy wire purposes along the project frontage. The applicant or owner is responsible for complying with the requirements of this section and shall make the necessary arrangements with the utility company for the installation of such facilities. New power poles shall not be installed unless otherwise approved by the City Engineer. A letter from the owners of the affected utilities shall be submitted to the City Engineer prior to approval of the Grading Plan, informing the City that they have been notified of the City's utility undergrounding requirement and their intent to commence design of utility undergrounding plans. When available, the utility undergrounding plan shall be submitted to the City Engineer identifying all above ground facilities in the area of the project to be undergrounded.

45. In accordance with City Ordinance No. 1589, adopted to preserve newly paved streets, any and all street and/or trench cuts in newly paved streets will be subject to moratorium street repair standards as reference in Section 11.04.145 of the Rialto Municipal Code. Contact the Engineering Division for a list of streets subject to the moratorium.

46. The minimum pavement section for all on-site pavements shall be three (3) inches asphalt concrete pavement over four (4) inches crushed aggregate base with a minimum subgrade of twenty-four (24) inches at 95% relative compaction, or equal. If an alternative pavement section is proposed, the proposed pavement section shall be designed by a California registered Geotechnical Engineer using "R" values from the project site and submitted to the City Engineer for approval.

47. The applicant shall replace all damaged, destroyed, or modified pavement legends, traffic control devices, signing, striping, and streetlights, associated with the proposed development shall be replaced as required by the City Engineer prior to issuance of a Certificate of Occupancy.

48. The applicant shall provide construction signage, lighting and barricading shall be provided during all phases of construction as required by City Standards or as directed by the City Engineer. As a minimum, all construction signing, lighting and barricading shall be in accordance with Part 6 "Temporary Traffic Control" of the 2014 California Manual on Uniform Traffic Control Devices, or subsequent editions in force at the time of construction.

49. The public street improvements outlined in these Conditions of Approval are intended to convey to the developer an accurate scope of required improvements, however, the City Engineer reserves the right to require reasonable additional improvements as may be determined in the course of the review and approval of street improvement plans required by these conditions.

50. The applicant shall be responsible for coordinating with Omnitrans regarding the potential location of existing, proposed, and future bus stops along the property frontage of all public streets. In the event Omnitrans identifies improvements of an existing, proposed, and future stop along the property frontage prior to applicant's receipt of a building permit, the applicant shall design street and sidewalk improvements in accordance with the latest Omnitrans bus stop guidelines and in compliance with current accessibility standards pursuant to the Americans with Disabilities Act (ADA) requirements. The applicant shall design all any bus stops to accommodate the Omnitrans Premium Shelters. Prior to Certificate of Occupancy, if Omnitrans requires a bus stop along the property frontage, the applicant shall submit to Public Works verification from Omnitrans acknowledging concurrence with the existing, proposed, and future bus stop improvements in conformance with the Premium Shelter design guidelines. Additionally, any bus turnouts are required to accommodate proposed bus stops in accordance with the City Standards and as approved by the City Engineer.

51. Development of the site is subject to the requirements of the National Pollution Discharge Elimination System (NPDES) Permit for the City of Rialto, issued by the Santa Ana Regional Water Quality Control Board, Board Order No. R8-2024-0001. Pursuant to the NPDES Permit, the developer shall ensure development of the site incorporates post-construction Best Management Practices (BMPs) in accordance with the Model Water Quality Management Plan (WQMP) approved for use for the Santa Ana River Watershed. The developer is advised that applicable Site Design BMPs will be required to be incorporated into the final site design, pursuant to a site specific WQMP submitted to the City Engineer for review and approval.

52. Prior to grading plan approval, the applicant shall submit a final hydrology study to determine the volume of increased stormwater runoff due to development of the site, and to determine required stormwater runoff mitigation measures for the proposed development. All stormwater runoff passing through the site shall be accepted and conveyed across the property in a manner acceptable to the City Engineer. For all stormwater runoff falling on the site, on-site retention or other facilities approved by the City Engineer shall be required to contain the increased stormwater runoff generated by

the development of the property. Hydrology studies shall be prepared in accordance with the San Bernardino County Hydrology Manual and Rialto drainage criteria. Final retention basin sizing and other stormwater runoff mitigation measures shall be determined upon review and approval of the hydrology study by the City Engineer and may require redesign or changes to site configuration or layout consistent with the findings of the final hydrology study. The volume of increased stormwater runoff to retain on-site shall be determined by comparing the existing pre-developed condition and proposed developed condition, using the 100-year frequency storm.

53. Prior to grading plan approval, direct release of on-site nuisance water or stormwater runoff shall not be permitted to the adjacent public streets. Provisions for the interception of nuisance water from entering adjacent public streets from the project site shall be provided through the use of a minor storm drain system that collects and conveys nuisance water to landscape or parkway areas, and in only a stormwater runoff condition, pass runoff directly to the streets through parkway or under sidewalk drains.

54. Prior to grading plan approval, the applicant shall submit a Geotechnical/Soils Report, prepared by a California registered Geotechnical Engineer, for and incorporated as an integral part of the grading plan for the proposed development. The geotechnical report shall include a section on infiltration testing. A digital copy (PDF) of the Geotechnical/Soils Report shall be submitted to the Engineering Services Department with the first submittal of the Precise Grading Plan.

55. Prior to grading plan approval, the applicant shall submit a Final Water Quality Management Plan identifying site-specific Best Management Practices (BMPs) in accordance with the Model Water Quality Management Plan (WQMP) approved for use for the Santa Ana River Watershed. The site specific WQMP shall be submitted to the City Engineer for review and approval with the precise grading plan. The Applicant acknowledges that more area than currently shown on the plans may be required to treat site runoff as required by the WQMP guidance document and FWQMP.

56. Prior to grading plan approval, a Notice of Intent (NOI) to comply with the California General Construction Stormwater Permit (Water Quality Order 2022-0057-DWQ as modified September 1, 2025) is required via the California Regional Water Quality Control Board online SMARTS system. A copy of the executed letter issuing a Waste Discharge Identification (WDID) number shall be provided to the City Engineer. The developer's contractor shall prepare and maintain a Storm Water Pollution Prevention Plan (SWPPP) as required by the General Construction Permit. All appropriate measures to prevent erosion and water pollution during construction shall be implemented as required by the SWPPP.

57. Prior to issuance of grading permit or on-site construction permit, the applicant shall submit a Precise Grading Plan prepared by a California registered civil engineer to the Engineering Division for review and approval by the City Engineer. The plan shall conform to the requirements of the California Building Code for review and approval.

58. Prior to the issuance of a grading permit or on-site construction permit, the applicant shall apply for annexation of the underlying property into City of Rialto Landscape and Lighting Maintenance District No. 2 ("LLMD 2"). An application fee of $5,000 shall be paid at the time of application. Annexation into LLMD 2 is a condition of acceptance of any new median, landscape easement, and/or parkway landscaping in the public right-of-way, or any new public street lighting improvements conditioned on the project and to be maintained by the City of Rialto post construction. The applicant must apply and complete the LLMD2 annexation process prior to issuance of a Certificate of Occupancy. Due to the required City Council Public Hearing action, the annexation process takes months and as such the developer is advised to apply for Special District annexation as early-on in the in the process to avoid any delays with permit issuance.

59. Prior to the issuance of a building permit, the applicant shall submit off-site landscaping and irrigation system improvement plans for review and approval concurrently with street improvement plan submittal to the Public Works Department. The median irrigation system, parkway irrigation system, and applicable Specific Plan required landscape easement irrigation system shall be separately metered from the on-site private irrigation to facilitate separate utility bill payment by the City after the required one-year maintenance period via the Landscape and Lighting Maintenance District No. 2. The off-site landscape and irrigation plans must show separate electrical meter, water meter, and separate irrigation lateral to be annexed into LLMD2 via a City Council public hearing process. Use of an existing LLMD2 water meter and electrical pedestal is encouraged. The Landscape and Irrigation plans shall be approved concurrently with the Street Improvement plans, including any median portion, applicable easement portion, and/or parkway portion. The landscaping architect must contact the City of Rialto Landscape Contract Specialist at (909) 820-2602 to ensure all landscape and irrigation guidelines are met prior to plan approval. Electrical and water irrigation meter pedestals must not be designed to be installed at or near street intersections or within a raised median to avoid burdensome traffic control set-up during ongoing maintenance. The off-site Landscape and Irrigation plans shall be designed in accordance with the Public Works Landscape Maintenance District Guidelines.

60. All parkway landscaping shall be guaranteed for a period of one year from the date of acceptance by the City Engineer acceptance. Any landscaping that fails during the one-year landscape maintenance period shall be replaced with similar plant material to the satisfaction of the City Engineer and shall be subject to a subsequent one-year landscape maintenance period. The applicant must contact the City of Rialto Landscape Contract Specialist at (909) 820-2602 to confirm a full twelve (12) months' time of non-interrupted ongoing maintenance.

61. The applicant shall install City Engineer approved deep root barriers, in accordance with the Public Works Landscape and Irrigation Guidelines, for all trees installed within the public right-of-way and within ten (10) feet of the public sidewalk and/or curb.

62. Prior to issuance of an encroachment permit or off-site construction permit, all public improvement plans must be submitted and approved by the City Engineer.

63. Prior to street improvement plan approval, the applicant shall dedicate additional right-of-way along the entire frontage of Locust Avenue, as necessary, to provide the ultimate half-width of 44 feet, as required by the City Engineer.

64. Prior to street improvement plan approval, submit a 10-foot easement on Lowell Street for public sidewalk and public utility purposes along the entire project. The easement shall be approved and recorded prior to plan approval. Prior to street improvement plan approval, dedicate additional right-of-way as may be required to provide a property line – corner cutback at the corner of Locust Avenue and Lowell Street. Nothing shall be constructed or planted in the corner cut-off area which does or will exceed 30 inches in height required to maintain an appropriate corner sight distance, as required by the City Engineer. The dedication shall be reviewed, approved, and submitted for recording prior to plan approval.

65. The applicant shall install 4-inch conduit and pull boxes within the parkway area along the entire project frontages of Locust Avenue for future use, prior to the issuance of a Certificate of Occupancy. The conduit and pull boxes shall be identified on the street improvement plans, prior to issuance of off-site construction permits.

66. Prior to issuance of a building permit, the applicant shall submit street improvement plans prepared by a registered California civil engineer to the Engineering Services Department for review. The street improvement plans shall be approved concurrently with any streetlight, landscape and irrigation, and traffic signal plans unless otherwise approved by the City Engineer.

67. Prior to issuance of building permit, the applicant shall submit traffic striping and signage plans prepared by a California registered civil engineer or traffic engineer, for review and approval by the City Engineer. All required traffic striping and signage improvements shall be completed concurrently with required street improvements to the satisfaction of the City Engineer.

68. Prior to issuance of encroachment permit or off-site construction permit, the applicant shall submit street light improvement plans, for Locust Avenue and Lowell Street, prepared by a California registered civil engineer to the Engineering Services Department. The plans shall be approved by the City Engineer prior to issuance of any building permits.

69. Prior to issuance of encroachment permit or off-site construction permit, the applicant shall submit sewer improvement plans prepared by a California registered civil engineer to the Engineering Division. The plans shall be approved by the City Engineer prior to issuance of any building permits. The applicant is advised that sewer service is provided by Rialto Water Services.

70. Prior to issuance of encroachment permit or off-site construction permit, the applicant shall submit water improvement plans prepared by a California registered civil engineer

to the Engineering Division to be reviewed concurrently with the water purveyor. The applicant is advised that domestic water service is provided by West Valley Water District. The applicant shall be responsible for coordinating with water purveyor and complying with all requirements for establishing domestic water service to the property.

71. Prior to issuance of a building permit, the Precise Grading plans shall be approved by the City Engineer.

72. Prior to the issuance of a building permit, the applicant shall submit a rough grade certification, engineered fill certification and compaction report pad elevation certifications for all building pads in conformance with the approved precise grading plan, to the Engineering Division. Trenching for footings or construction of any building foundation is not allowed until the certifications have been submitted for review and approval by the City Engineer.

73. Prior to issuance of building permit, the applicant shall submit a Subdivision Improvement Agreement (SIA) and the required security to the Engineering Division for review and acceptance.

74. Prior to issuance of building permit, Parcel Map 20809 shall be approved by the City and submitted for recording at the County Recorder's Office.

75. Prior to the issuance of a certificate of occupancy, the applicant shall submit a precise/final grade certification to the Engineering Services Department.

76. Prior to the issuance of a certificate of occupancy, all public improvements shall be constructed to City standards subject to the satisfaction of the City Engineer.

77. The applicant shall reconstruct any broken, chipped, or unsatisfactory sidewalks, curbs, gutters, pavement, and landscaping along the entire project frontage, in accordance with the General Plan and the City of Rialto Standard Drawings, as required by the City Engineer, prior to the issuance of a Certificate of Occupancy. The removal and reconstruction of improvements shall be identified on the street improvement plans, prior to issuance of off-site construction permits.

78. The applicant shall install "No Stopping Anytime" R26A(S)(CA) signage along the entire project frontages of Locust Avenue and Lowell Street, as required by the City Engineer, prior to the issuance of a Certificate of Occupancy.

79. The applicant shall connect the project to the City of Rialto sewer system and apply for a sewer connection account with Rialto Water Services.

80. The applicant is advised that domestic water service is provided by West Valley Water District. The applicant shall be responsible for coordinating with West Valley Water District and complying with all requirements for establishing domestic water service to the property.

81. The applicant shall provide certification from West Valley Water District and Rialto Water Services that demonstrates that all water and/or wastewater service accounts for the project are documented, prior to the issuance of a Certificate of Occupancy from the Engineering Division.

82. Prior to issuance of a certificate of occupancy or final City approvals, the applicant shall demonstrate and submit a WQMP BMP certification that all structural BMP's have been constructed and installed in conformance with approved plans and specifications, and as identified in the approved WQMP.

83. Prior to issuance of a certificate of occupancy, a WQMP Maintenance Agreement shall be required, obligating the property owner(s) to appropriate operation and maintenance obligations of on-site BMPs constructed pursuant to the approved WQMP.

84. The applicant shall construct one (1) new commercial driveway approach on Locust Avenue and three (3) new commercial driveway approaches on Lowell Street, in accordance with City of Rialto Standard Drawing No. SC-213 or SC-214, or as otherwise approved by the City Engineer, prior to the issuance of a Certificate of Occupancy. The driveway approach shall be constructed so the top of "X" is 5 feet from the property line, or as otherwise approved by the City Engineer. Nothing shall be constructed or planted in the corner cut-off area which does exceed or will exceed 30 inches in height in order to maintain an appropriate corner sight distance, as required by the City Engineer. If necessary, additional right of way shall be dedicated on-site to construct a path of travel meeting ADA guidelines.

85. Prior to occupancy approval, all new streetlights shall be installed on an independently metered, City-owned underground electrical system. Using power from an existing LMMD 2 pedestal is encouraged over installing a new pedestal The developer shall provide documentary proof of application with Southern California Edison ("SCE") for all appropriate service points and electrical meters prior to the issuance of a Certificate of Occupancy. New meter pedestals shall be installed, and electrical service paid by the developer, until such time as the underlying property is annexed into LLMD 2. The City shall not pay the charges for electrical service until the landscape and irrigation is accepted after the one-year maintenance period and the underlying property is annexed into LLMD 2.

86. If and where deficiencies in the existing system occur, the applicant shall construct a new underground electrical system for public street lighting improvements along the project frontage of Locust Avenue, as determined necessary by the City Engineer, prior to the issuance of a Certificate of Occupancy. New marbelite streetlight poles with LED light fixtures shall be installed in accordance with City of Rialto Standard Drawings, and as approved by the City Engineer.

87. The applicant shall construct curb ramps meeting current California State Accessibility standards on both sides of proposed driveways along Locust Avenue and Lowell Street,

in accordance with the City of Rialto Standard Drawings, and as required by the City Engineer. The applicant shall provide a fully detailed curb return, ramp, and sidewalk approach design of a scale of one-inch equals ten-feet or larger. The applicant shall ensure that an appropriate path of travel, meeting ADA guidelines, is provided across the driveway, and shall adjust the location of the access ramps, if necessary, to meet ADA guidelines, subject to the approval of the City Engineer.

88. The applicant shall construct an 8-inch curb and gutter along the entire frontage of Locust Avenue thirty-two (32) feet west of the centerline, in accordance with City of Rialto Standard Drawings, prior to the issuance of a Certificate of Occupancy.

89. The applicant shall construct an 8-inch curb and gutter along the entire frontage of Lowell Street twenty-two (22) feet south of the centerline, in accordance with City of Rialto Standard Drawings, prior to the issuance of a Certificate of Occupancy.

90. The applicant shall construct a 5.5-foot-wide Americans with Disabilities Act (ADA) compliant sidewalk adjacent to the curb along the entire project frontages of Locust Avenue and Lowell Street, in accordance with City of Rialto Standard Drawings, prior to issuance of a Certificate of Occupancy.

91. Prior to occupancy approval – Locust Avenue is designated a Secondary Arterial with 88-foot right-of-way and 64-foot curb to curb dimensions. The developer shall submit street improvement plans and construct the improvements that include, but are not necessarily limited to, the following:

    a. Remove existing pavement and construct new pavement with a minimum pavement section of 5 inches asphalt concrete pavement over 6 inches crushed aggregate base with a minimum subgrade of 24 inches at 95% relative compaction, or equal, for the entire street half-width plus the northbound lane along the project frontage in accordance with City of Rialto Standard Drawings. The final 2-inch cap shall be PG 64-10 ARHM CC G. The pavement section shall be determined using a Traffic Index ("TI") of 10. The pavement section shall be designed by a California registered Geotechnical Engineer using "R" values from the existing pavement core samples and submitted to the City Engineer for approval. Alternatively, depending on the existing street condition (i.e. taking core samples) and as approved by the City Engineer, a street 2-inch grind and overlay, using PG 64-10 ARHM CC G, may be performed to preserve existing pavement improvements.

92. Prior to occupancy approval – Lowell Street is designated an Industrial Street with 45-foot right- of-way and 44-foot curb to curb dimensions. The developer shall submit street improvement plans and construct the improvements that include, but are not necessarily limited to, the following:

    a. Remove existing pavement and construct new pavement with a minimum pavement section of 5 inches asphalt concrete pavement over 6 inches crushed

aggregate base with a minimum subgrade of 24 inches at 95% relative compaction, or equal, for the street half width plus a street 2-inch grind and overlay along the northern half of the street along the project frontage in accordance with City of Rialto Standard Drawings. The final 2-inch cap shall be PG 64-10 ARHM CC G. The pavement section shall be determined using a Traffic Index ("TI") of 10. The pavement section shall be designed by a California registered Geotechnical Engineer using "R" values from the existing pavement core samples and submitted to the City Engineer for approval. Alternatively, depending on the existing street condition (i.e. taking core samples) and as approved by the City Engineer, a street 2-inch grind and overlay, using PG 64-10 ARHM CC G, may be performed to preserve existing pavement improvements. Should the above improvements be completed by another party, this condition shall be met as satisfied.

93. All sewer mains constructed by the applicant, as necessary, are to become part of the public sewer system and shall be pressure tested and digitally video recorded by the City's wastewater system operator (Veolia) prior to acceptance of the sewer system for maintenance by the City. The applicant shall be responsible for all costs associated with testing and inspection services. Any defects of the sewer main shall be removed, replaced, or repaired to the satisfaction of the City Engineer prior to acceptance.

94. The original improvement plans prepared for the proposed development and approved by the City Engineer (if required) shall be documented with record drawing "as-built" information and returned to the Engineering Division prior to issuance of a final certificate of occupancy. Any modifications or changes to approved improvement plans shall be submitted to the City Engineer for approval prior to construction.

95. Prior to commencing with any grading, the applicant shall implement the required erosion and dust control measures shall be in place. In addition, the following shall be included if not already identified:

    a. 6 foot high tan colored perimeter screened fencing

    b. Contractor information signage including contact information along the street frontages of Locust Avenue and Lowell Street.

    c. Post dust control signage with the following verbiage: "Project Name, WDID No., IF YOU SEE DUST COMING FROM THIS PROJECT CALL: NAME (XXX) XXX-XXX, If you do not receive a response, please call the AQMD at 1-800-CUT-SMOG/1-800-228-7664"

96. The applicant shall submit full architectural and structural plans with all mechanical, electrical, and plumbing plans, structural calculations, truss calculations and layout, rough grading plans approved by Engineering Services Department, Water Quality Management Plan, Erosion Control Plan, Stormwater Pollution Prevention Plan, and

Title 24 Energy Calculations to the Building Division for plan check and review, prior to the issuance of building permits.

97. The applicant shall provide a Scope of Work on the title page of the architectural plan set. The Scope of Work shall call out all work to be permitted (ex. Main structure, perimeter walls, trash enclosure, etc.).

98. The applicant shall design the structures in accordance with the 2022 California Building Code, 2022 California Mechanical Code, 2022 California Plumbing Code, and the 2022 California Electrical Code, 2022 Residential Code and the 2022 California Green Buildings Standards adopted by the State of California.

99. The applicant shall design the structures to withstand ultimate wind speed of 130 miles per hour, exposure C and seismic zone D.

100. The applicant shall obtain an Electrical Permit from the Building Division for any temporary electrical power required during construction. No temporary electrical power will be granted to a project unless one of the following items is in place and approved by the Building Division: (A) Installation of a construction trailer, or, (B) Security fencing around the area where the electrical power will be located.

101. The applicant shall install any required temporary construction trailer on private property. No trailers are allowed to be located within the public right-of-way. The trailer shall be removed prior to the issuance of a Certificate of Occupancy.

102. The applicant shall design and construct accessible paths of travel from the building's accessible entrances to the public right-of-way, accessible parking, and the trash enclosure. Paths of travel shall incorporate (but not limited to) exterior stairs, landings, walks and sidewalks, pedestrian ramps, curb ramps, warning curbs, detectable warning, signage, gates, lifts and walking surface materials, as necessary. The accessible route(s) of travel shall be the most practical direct route between accessible building entrances, site facilities, accessible parking, public sidewalks, and the accessible entrance(s) to the site, California Building Code, (CBC) Chapter 11, Sec, 11A and 11B.

103. Prior to issuance of a Building Permit all of the following must be in place on the Site: a portable toilet with hand wash station, all BMP's, fencing and signage on each adjacent street saying "If there is any dust or debris coming from this site please contact (superintendent number here) or the AQMD if the problem is not being resolved" or something similar to this.

104. The applicant shall provide temporary toilet facilities for the construction workers. The toilet facilities shall always be maintained in a sanitary condition. The construction toilet facilities of the non-sewer type shall conform to ANSI ZA.3.

105. The applicant shall underground all on site utilities to the new proposed structures, prior to the issuance of a Certificate of Occupancy, unless prior approval has been obtained by the utility company or the City.

106. Prior to issuance of Building Permits, site grading final and pad certifications shall be submitted to the Building Division, which include elevation, orientation, and compaction. The certifications are required to be signed by the engineer of record.

107. The applicant shall provide proof of payment to the Rialto Unified School District for all required school fees, prior to the issuance of a building permit.

108. Site facilities such as parking open or covered, recreation facilities, and trash dumpster areas, and common use areas shall be accessible per the California Building Code, Chapter 11.

109. The applicant shall place a copy of the Conditions of Approval herein on within the building plan check submittal set and include the PPD number on the right bottom corner cover page in 20 point bold, prior to the issuance of a building permit.

110. The applicant shall ensure that a minimum of 65% of all construction and demo debris shall be recycled using an approved City of Rialto recycling facility during construction. Copies of receipts for recycling shall be provided to the City Inspector and a copy shall be placed in the office of the construction site.

111. Prior to issuance of Building Permits, on site water service shall be installed and approved by the responsible agency. On site fire hydrants shall be approved by the Fire Department. No flammable materials will be allowed on the site until the fire hydrants are established and approved.

112. Grades for driveway and fire apparatus access roads shall not exceed 12%. Fire Department approval and additional conditions may be required for grades above 12% maximum. Angle of approach and departure for driveways shall not exceed 7 degrees. If Grades are authorized to exceed 12% they shall be concrete with a deep broom finish perpendicular to the access roadway and other special conditions determined by the Fire Marshal.

113. A hazardous materials inventory and disclosure shall be provided with a complete listing of SDS sheets, storage locations, how they are stored, and types of containers. A technical report and opinion prepared by an approved consultant shall be submitted for review and approval prior to or as part of the submission for a building permit. Operational permits may be required and must be applied for prior to certificate occupancy. Application and permits shall be made to San Bernardino County Fire Department Hazardous Materials Divisions CUPA for CUPA compliance. Compliance with disclosure and requirements placed on the project for the CUPA shall be complied with prior to certificate of occupancy.

114. The building has the potential for storage of combustible stock more than 6 ft. in height (rubber tires and/or group A plastics) or commodity storage 12 ft. in height and greater than 500 square feet, meeting the requirements of high-piled combustible storage as defined in Chapter 32 of the California Fire Code. Significant modifications to the structure including, but not limited to, smoke and heat vents or mechanical ventilation, draft curtains, special access doors, upgraded sprinkler systems and hose connection requirements must be achieved in compliance with the California Fire Code Chapter 32 and other applicable Chapters and NFPA 13 requirements should such storage occur. Minimum design densities for fire sprinkler systems within spec. buildings without a known tenant shall be 0.33/3000. If high-piled combustible storage is proposed then plans, specifications, and a technical opinion and report shall be submitted from an approved consultant with the construction drawings for rack systems to ensure fire protection requirements. High piled combustible storage requires an annual operational permit pursuant to the California Fire Code Chapter 1 that requires appropriate fees to be paid prior to issuance and renewal.

115. To determine the acceptability of technologies, processes, products, facilities, materials and uses attending the design, operation or use of a building or premises subject to inspection by the fire code official, the fire code official is authorized to require the owner or agent to provide, without charge to the jurisdiction, a technical opinion and report. The opinion and report shall be prepared by a qualified engineer, specialist, laboratory, or fire safety specialty organization acceptable to the fire code official and shall analyze the fire safety properties of design, operation or use of the building or premises and the facilities and appurtenances situated thereon, to recommend necessary changes. The fire code official is authorized to require design submittals to be prepared by, and bear the stamp of, a registered design professional.

116. Rialto Fire Department at time of plan or permit submission will charge certain fees for plan review and inspections. Fees will be determined at time of plan review and/or inspections.

117. Rialto Fire Department at time of operational permit application will charge certain fees for permit issuance which will have, at a minimum, annual fees charged. Failure to pay required annual fees will be cause to issue a "Cease and Desist" order for the system, use or operation permitted.

118. The proposed project shall comply with the applicable codes and standards of Title 24, Part 1-12. Additional requirements may be made during the building permit process based on system, processes and uses of the building.

119. A fire command center for fire department operations shall be provided for Factories, Mercantile, and storage occupancies. The fire command center shall be a minimum of 200 square feet and meet the requirements of the California Fire Code Chapter 5 Section 508.

120. The required fire flow shall be 4,000 GPM for a 4-hour duration at 20 PSI residual operating pressure pursuant to the California Fire Code Appendix B. Documentation is required from the local water purveyor or an approved third party verifying that the system can meet the required fire flow prior to conditions of approval being established. If a third party is being used, they must be approved by the Fire Marshal. If the system is not capable of meeting the required fire flow documentation shall be provided showing financial arrangements have been made and water system improvement plans have been submitted and approved by Rialto Fire Department and the local water purveyor to upgrade the existing water system prior to release of building permits.

121. Fire apparatus access roads shall be designed and maintained to support the imposed loads of fire apparatus at 75,000 pounds and shall be surfaced to provide all weather driving capabilities. All weather driving capabilities include pavement, concrete, or other approved products or materials as approved by the fire code official. Turf blocks, ritter rings, turf paver and other similar products shall not be used for fire department access surfacing.

122. Any gate or barrier across a fire access roadway, whether manual or automatic, must meet the Rialto Fire Department requirements and have specific plans and permits approved prior to installation. Gates serving multi-family, assembly, educational, hazardous, institutional, or storage structures must be automatic and meet UL 325 and ASTM F2200 standards. Knox brand key-operated electric key switch keyed to Rialto Fire Department specification are required. The Knox switch shall override all gate functions and open the gate. Other access control systems, such as pre-emption device eyes, are required and must be installed as directed by the Fire Marshal.

123. Water improvement plans shall be approved by Rialto Fire Department. The Developer shall furnish Rialto Fire Department with copies of the water improvement plans designed by a Registered Engineer and/or Licensed Contractor. On-site private fire service mains shall have a minimum of eight (8) inch water mains with six (6) inch laterals and risers. Larger pipes may be required to meet required fire flow requirements. Fire hydrants shall provide one 4" port and 2- 2 ½ ports and must be an approved fire hydrant type. The private fire hydrant system must be reviewed, approved, permitted and installed, tested, and accepted, prior to combustible construction.

124. Fire hydrant water mains that supply two (2) or more fire hydrants shall be looped to provide adequate supply.

125. Buildings that exceed 200,000 square feet, or meet the requirements of the local water purveyor, shall have at least two separate points of connection to a water supply, as approved by Rialto Fire Department and the local water purveyor.

126. Prior to combustibles being brought to the site, the developer shall provide written certification from the local water purveyor, dated within the last thirty days, that:

A. All public fire hydrants or water purveyor connections required for the project have been installed, tested, and approved; and

B. Are permanently connected to the public water main system; and

C. Are capable of supplying the required fire flow as required by Rialto Fire Department.

127. Fire hydrants shall be painted (yellow for public and red for private on-site FH's) per Rialto Fire Department and the local water purveyor standards and be maintained free of obstructions. A five (5) foot (1524 mm) clear space shall be maintained around the circumference of fire hydrants and fire protection systems. Blue reflective raised pavement markers shall be installed on the pavement at approved locations marking each fire hydrant location.

128. Public and private water utility mains must provide the level of reliability/redundancy determined necessary by Rialto Fire Department and the local water purveyor.

129. If any fire hydrant is taken "OUT OF SERVICE" – Rialto Fire Department shall be notified immediately and the hydrant marked, bagged, or otherwise identified as OUT OF SERVICE as directed by the Fire Marshal.

130. Fire lane designations shall be required for all fire access roadways as determined by Rialto Fire Department. Posted signs which state "FIRE LANE, NO PARKING CVC 22500.1" shall be installed every 25 feet along the fire lanes. Curbs shall be painted red and stenciled with white letters indicating the same on the face and top of any curb as directed by Rialto Fire Department. All Fire lanes shall be marked and identified prior to any Certificate of Occupancy being issued.

131. Prior to Fire Department clearance for occupancy, an automatic fire sprinkler system shall be installed. The system shall comply with NFPA #13 Standards for Automatic Fire Sprinkler Systems. Plans will be accepted only electronically and shall include fire sprinkler piping plans and details, hydraulic calculations, and material specifications sheets for all equipment used in the system and shall be submitted per the policy of Rialto Fire Department for electronic submission. These shall be submitted by a State of California Licensed C-16 Contractor for review, approval, and permits must be issued prior to commencing work.

132. Prior to Fire Department Clearance for occupancy, and automatic fire alarm system shall be installed. The system shall comply with NFPA #72 standard for Fire Alarm Systems. Plans and specifications must only be submitted electronically with material specifications sheets for all equipment used in the system and California State Fire Marshal listings (not expired) shall be submitted by a State of California Licensed C-7 and/or C-10 Contractor for review, approval, and permits must be issued prior to commencing work.

133. Prior to final inspection or occupancy, hand portable fire extinguishers are required to be installed as directed by Rialto Fire Department. The size, location, and markings shall be illustrated on the floor plan of the construction documents. Prior to installation the client is directed to request a fire inspection to confirm the locations of the fire extinguishers due to field changes with business systems that could conflict with the construction documents.

134. An automatic smoke removal ventilation system (fusible link type) is required. Roof vents, venting ratios and draft curtains shall be provided in accordance with the California Fire Code, NFPA and all other applicable standards. This information shall be provided in sufficient detail on the building construction drawings and submitted to Rialto Fire Department for review, approval and permits must be issued prior to commencing work.

135. Permanent commercial/industrial three-dimensional street numbers, minimum 12 inches in height with a ½ inch stroke, shall be provided on the address side of the building at the highest point and furthest projection of the structure and on both corners (left and right) of the building facing the street that it is addressed to. The address shall be illuminated and visible from the street and shall not be obstructed in any manner, including landscaping. Roof mounted addressing for aerial support shall be provided for flat roofs or as directed by the fire code official and shall be a minimum of 3-feet in height, face the street in which it is addressed, be contrasting in color and durable enough for the weather conditions in which it will be exposed.

136. Knox emergency access key box is required at each building, with specific mounting locations approved by Rialto Fire Department. For multi-tenant buildings one Knox box shall be provided for every ten tenant spaces and the installation of the Knox box shall be at the fifth (middle) tenant in an approved location. Recessed mount key boxes are required. Premise keys for all buildings, tenants and areas shall be marked/tagged and placed in the box prior to final inspection to ensure emergency access. The building owner/occupants shall provide replacement keys whenever locks are changed.

137. An emergency responder radio coverage plan is required to be submitted, reviewed, approved and permits issued, prior to commencing work. Emergency responder radio coverage must meet the requirements of the California Fire Code, Chapter 5, Section 510 and Rialto Fire Department. Field tests are required prior to final inspection or occupancy.

138. A fire department operational permit is required for certain specific operations regulated by the California Fire Code. The permit is issued after application has been made to Rialto Fire Department and full compliance of the requirements for the operation has been adhered to. An annual fee is charged to the applicant for review and inspection of such permits on an annual basis. Some permits require additional inspections and permit compliance that may require additional fees to be paid semi-annually.

139. Provide plans in a PDF file for pre-fire planning use by the fire department. Information shall include locations of all exits, stairwells and roof access. Also, the location of fire hydrants, fire department connections, post indicator valves, backflow prevention, gas meters, electrical panels, water, fire sprinkler risers and standpipe valves and shutoffs, elevator and electrical equipment rooms, fire alarm panels, and remote annunciators. The symbols used for the pre-fire plan must be obtained from Rialto Fire Department. This plan is required to be submitted prior to any type of certificate of occupancy.

140. The applicant shall illuminate all walkways, passageways, and locations where pedestrians are likely to travel with a minimum of 1.5-foot candles (at surface level) of light during the hours of darkness, or as approved by the Rialto Police Department. Lighting shall be designed/constructed in such a manner as to automatically turn on at dusk and turn off at dawn.

141. The applicant shall illuminate all alleyways, driveways, and uncovered parking areas with a minimum of 1.5-foot candles (at surface level) of light during the hours of darkness, or as approved by the Rialto Police Department. Lighting shall be designed/constructed in such a manner as to automatically turn on at dusk and turn off at dawn.

142. The applicant shall illuminate all loading dock areas, truck well areas, and delivery areas with a minimum of 2.0 foot-candles (at surface level) of light during the hours of darkness, or as approved by the Rialto Police Department. Lighting shall be designed/constructed in such a manner as to automatically turn on at dusk and turn off at dawn.

143. The applicant shall design/construct all lighting fixtures and luminaries, including supports, poles and brackets, in such a manner as to resist vandalism and/or destruction by hand.

144. The applicant shall provide an illuminated channel letter addresses prominently placed on the building to be visible to the front of the location and if applicable, visible from the main street to which they are located (e.g. commercial building facing the interior of the property would require two address signs if located adjacent to a roadway), prior to the issuance of a Certificate of Occupancy.

145. At the discretion of the Rialto Police Department, the applicant shall install exterior security cameras at the location that cover the entire Site, prior to the issuance of a Certificate of Occupancy. The security cameras shall be accessible to the Rialto Police Department via FusionONE web application.

146. The applicant shall install Knox boxes immediately adjacent to the main entrance of the building, at least one (1) rear entrance on the building, and at the gates into the truck court to facilitate the entry of safety personnel to facilitate the entry of safety personnel. The Knox boxes shall be installed in such a manner as to be alarmed, resist vandalism, removal, or destruction by hand, and be fully recessed into the building. The Knox

boxes shall be equipped with the appropriate keys, for each required location, prior to the first day of business. The Knox-Box placement shall be shown on the formal building plan review submittal prior to the issuance of a building permit.

147. The applicant shall prominently display the address on the building rooftop to be visible to aerial law enforcement or fire aircraft. Specifications to be followed for alphanumeric characters are as follows: Three (3) foot tall and six (6) inches thick alphanumeric characters. The alphanumeric characters shall be constructed in such a way that they are in stark contrast to the background to which they are attached (e.g. white numbers and letters on a black background), and resistant weathering that would cause a degradation of the contrast.

148. The applicant shall provide an audible burglar alarm within the building, prior to the issuance of a Certificate of Occupancy. The building shall be alarmed in such a way as to emit a continuous audible notification until reset by responsible personnel (e.g. alarmed exit device / crash bar).

149. The applicant or General Contractor shall identify each contractor and subcontractor hired to work at the job site on a Contractor Sublist form and return it to the Business License Division with a Business License application and the Business License tax fee based on the Contractors tax rate for each contractor.

150. The applicant or General Contractor shall identify each contractor and subcontractor hired to work at the job site on a Contractor Sublist form and return it to the Business License Division with a Business License application and the Business License tax fee based on the Contractors tax rate for each contractor.

SECTION 5. The Chairman of the Planning Commission shall sign the passage and adoption of this resolution and thereupon the same shall take effect and be in force.

PASSED, APPROVED AND ADOPTED this 17th day of December, 2025.

_____

MICHAEL E. STORY, CHAIR
CITY OF RIALTO PLANNING COMMISSION

STATE OF CALIFORNIA)
COUNTY OF SAN BERNARDINO) ss
CITY OF RIALTO)

I, Heidy Gonzalez, Administrative Assistant of the City of Rialto, do hereby certify that the foregoing Resolution No. ____ was duly passed and adopted at a regular meeting of the Planning Commission of the City of Rialto held on the ___th day of ____, 2025.

Upon motion of Planning Commissioner_____., seconded by Planning Commissioner ____, the foregoing Resolution No. ____was duly passed and adopted.

Vote on the motion:

AYES:

NOES:

ABSENT:

IN WITNESS WHEREOF, I have hereunto set my hand and the Official Seal of the City of Rialto this __th day of ___, 2025.

GENERAL NOTES

1. VERIFY THAT ALL AREAS HAVE A POSITIVE ¼" PER FOOT MIN DRAINAGE PRIOR TO INSTALLATION UNLESS NOTED BY THE STRUCTURAL DRAWINGS.
2. COORDINATE WITH STRUCTURAL DRAWINGS FOR ROOF ELEVATIONS.
3. CONTRACTOR SHALL VERIFY ALL MECHANICAL UNIT LOCATIONS, CURBS AND HOOK UPS WITH SUBCONTRACTORS, MECHANICAL / STRUCTURAL ENGINEERS AND ARCHITECT PRIOR TO INSTALLATION.
4. BEFORE SETTING AND ANCHORING OF ANY ROOF MOUNTED EQUIPMENT CONTRACTOR TO CHECK IF SUCH EQUIPMENT ARE VISIBLE FROM PUBLIC WAY, ALERT THE ARCHITECT IF VISIBLE.
5. PROVIDE INVERTED CAP SHEET CRICKETS ALONG UPPER SLOPE OF ALL SKYLIGHTS, MECHANICAL EQUIPMENT UNITS AND OTHER OBTRANCE TO FACILITATE POSITIVE DRAINAGE.
6. WHEN REQUIRED BY LOCAL JURISDICTION AND PRIOR TO TRUSS INSTALLATION, TRUSS MANUFACTURER TO SUBMIT PLANS TO BUILDING DEPARTMENT FOR APPROVAL.
7. CONTRACTOR SHALL INSURE PROPER JOB SITE STORAGE OF MATERIALS TO MINIMIZE EXPOSURE TO MOISTURE DURING THE CONSTRUCTION CYCLE.
8. CONTRACTOR TO VERIFY ALL ROOF DEPRESSIONS PER STRUCTURAL DRAWINGS.
9. REFER TO PLUMBING DRAWINGS FOR ROOF DRAIN AND SIZING.
10. ALL ROOF FASTENERS SHALL MEET ALL LOCAL CODE AND REGULATIONS AND REQUIREMENTS. PROOF REQUIREMENTS ARE IN PROJECT JURISDICTION AND ALSO FACTORY MUTUAL WIND UPLIFT PRESSURE REQUIREMENTS.
11. WHEN APPLICABLE, FLEXIBLE FLASHING FOR SMOKE VENTS SHALL BE ONE TEMPERATURE RANGE HIGHER THAN THE ESFR SPRINKLER SYSTEM.
12. WHEN APPLICABLE, SIGNAGE STATE SHALL BE REQUIRED IF AREAS FOR "POTENTIAL OFFICES" WILL BE USED FOR HIGH PILE COMMODITIE STORAGE.
13. ROOF DRAINS, OVERFLOW DRAINS AND RAINWATER PIPING WITHIN THE INTERIOR OF THE BUILDING SHALL BE TESTED IN ACCORDANCE WITH THE PROVISIONS OF THE PLUMBING CODE FOR TESTING DRAIN, WASTE, AND VENT SYSTEMS.
14. ROOF DRAINS, OVERFLOW DRAINS AND PIPING WITHIN THE BUILDING SHALL UTILIZE APPROVED DRAINAGE FITTINGS.
15. MANUFACTURE ROOF DRAINS AND OVERFLOWS SHALL BE IAPMO LISTED.
16. REFER TO SSA SHEET FOR MINIMUM ROOFTOP REQUIREMENT.
17. AT THE END OF CONSTRUCTION, CLEAR ALL CONSTRUCTION DEBRIS ON ROOF AND AROUND ROOF DRAINS AND SCUPPERS.

KEYNOTES

1. CONCRETE PARAPET WALL PER STRUCTURAL. PAINT INSIDE FACE AND TOP OF PARAPET WALL WITH DOORMONT BUILDING COLOR WITH KILZ TONGING PAINT. TOP OF PARAPET SHALL BE BACKED SMOOTH.
2. CONCRETE PARAPET RETURN.
3. 4 P.LY. CLASS "A" BUILT UP ROOFING. JOHNS MANVILLE 4-ONC OR EQUAL. PROVIDE 15 YEAR NO DOLLAR WARRANTY WITH 25 YEAR ALTERNATE.
4. WHITE SCRIM UNDER ROOF DECK.
5. STRUCTURAL JOISTS/ORDER BELOW.
6. EXHAUST FAN PER MECHANICAL.
7. MECHANICAL ROOF TOP EQUIPMENT PER MECHANICAL/STRUCTURAL.
8. PLUMBING VENT PIPE PER PLUMBING.
9. 5' WIDE WALK PAD. JOHNS MANVILLE DYNATRED OR EQ.
10. EXTERIOR DOWN SPOUT AND OVERFLOW SCUPPERS.
11. INTERIOR ROOF DRAIN AND OVERFLOW SCUPPERS.
12. INTERIOR ROOF DRAIN AND OVERFLOW DRAIN.
13. ROOF ADDRESS NUMBER, 4ft TEXT, BLACK STENCIL
14. 96" 0.54' ACCESS ROOF HATCH WITH 42" BUILT IN GUARD RAIL.

GENERAL NOTES

1. ALL PAINT COLOR CHANGES TO OCCUR AT INSIDE CORNERS UNLESS NOTED OTHERWISE.
2. ALL PAINT FINISHES ARE TO BE FLAT UNLESS NOTED OTHERWISE.
3. STOREFRONT CONSTRUCTION: GLASS, METAL ATTACHMENTS AND UNITS SHALL BE DESIGNED TO RESIST WIND EXPOSURE "C" WINDS. CONTRACTOR SHALL SUBMIT SHOP DRAWINGS PRIOR TO INSTALLATION.
4. TOP AND BACK SIDE OF PARAPETS TO HAVE SMOOTH SACKED FINISH AND BE PAINTED WITH ELASTOMERIC PAINT.
5. FOR SPANDRELS: GLAZING, ALLOW SPACE BEHIND SPANDREL TO BREATH BY PROVIDING A MINIMUM 8" DIAMETER HOLE ON THE CORNER. DO NOT CORE DRILL. USE PVC PIPE DURING CASTING OF CONCRETE PANEL. REMOVE PVC AND SACK SMOOTH AND MANHOLES.
6. USE ADHESIVE BACK WOOD STRIPS FOR ALL REVEAL FORMS
7. PROVIDE SINGLE COAT OF PRIMER (MOLD ON) PLUS COVER UP WITH FIRST COAT OF PAINT TO BE ROLLED ON AND THE SECOND COAT TO BE SPRAYED ON. PROVIDE THIRD LAYER REQUIRED TO ACHIEVE FULL COLOR SATURATION AS REQUIRED.
8. WATER BLAST EXTERIOR FACE OF BUILDING WALLS PRIOR TO PAINT.
9. ALL CONCRETE PANEL JOINTS SHALL BE CLEARED OF DEBRIS BY PRESSURING WASHING THE CAVITY. GRIND ANY SHARP EDGES PRIOR TO APPLY PANEL CAULK JOINT.
10. ALL EXTERIOR DOORS AND LOUVERS SHALL BE FABRICATED AND WEATHER STRIPPED TO WITHSTAND WIND EXPOSURE "C"
11. CONTRACTOR TO PROVIDE MOCK UP PAINT AND FINISHES FOR OWNER AND ARCHITECTS APPROVAL PRIOR TO COMMENCING THE WORK.
12. ALL FINISH MATERIAL SUCH AS ADHESIVES, SEALANTS, PRIMERS AND CAULKS SHALL COMPLY WITH LOCAL OR REGIONAL AIR POLLUTION CONTROL OR AIR QUALITY MANAGEMENT DISTRICT RULES WHERE APPLICABLE. OR SCAQMD RULE 1168 VOC LIMIT IS AS SHOWN ON TABLE 5.504.4.1 AND 5.504.4.2. SUCH PRODUCTS ALSO SHALL COMPLY WITH RULE 1168 PROHIBITION ON THE USER OF CERTAIN TOXIC COMPOUNDS (CHLORODIFORM, ETHYLENE DICHLORIDE, METHYLENE CHLORIDE PERCHLOROETHYLENE AND TRICHLOROTHHFLUOROMETHANE) EXCEPT FOR AEROSOL PRODUCTS AS SPECIFIED IN BELOW
13. AEROSOL ADHESIVES AND SMALLER UNIT SIZES OF ADHESIVES AND SEALANT OR CAULKING COMPOUNDS (IN UNITS OF PRODUCTS, LESS PACKAGING, WHICH DO NOT WEIGH MORE THAN ONE POUND AND DO NOT CONSIST OF MORE THAN 10 FLUID OUNCES SHALL COMPLY WITH STATE, FEDERAL VOC STANDARDS AND OTHER REQUIREMENTS, INCLUDING PROHIBITIONS ON USE OF CERTAIN TOXIC COMPOUNDS

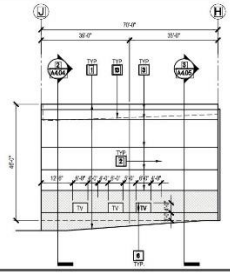
NORTHEAST ELEVATION — SCALE 1/16" = 1'-0" — 3



SOUTHEAST ELEVATION — SCALE 1/16" = 1'-0" — 4

GENERAL NOTES

1. ALL PAINT COLOR CHANGES TO OCCUR AT INSIDE CORNERS UNLESS NOTED OTHERWISE.
2. ALL PAINT FINISHES ARE TO BE FLAT UNLESS NOTED OTHERWISE
3. STOREFRONT CONSTRUCTION: GLASS, METAL ATTACHMENTS AND UNITS SHALL BE DESIGNED TO RESIST WIND EXPOSURE "C" WINDS. CONTRACTOR SHALL SUBMIT SHOP DRAWINGS PRIOR TO INSTALLATION.
4. TOP AND BACK SIDE OF PARAPETS TO HAVE SMOOTH SACKED FINISH AND BE PAINTED WITH FLAT ACRYLIC PAINT.
5. FOR SPANDREL GLAZING, ALLOW SPACE BEHIND SPANDREL TO BREATH BY PROVIDING A MINIMUM 2" DIAMETER HOLE IN TOP CORNER, DO NOT CORK OR FILL; USE PVC PIPE DURING CASTING OF CONCRETE PANEL, REMOVE PVC AND SACK SMOOTH AND OVERGLASS.
6. USE ADHESIVE BACK WOOD STRIPS FOR ALL REVEAL FORMS.
7. PROVIDE SMALL DOT OF PRIMER ROLLED ON / FOLLOWED UP WITH FIRST COAT OF PAINT TO BE ROLLED-ON AND THE SECOND COAT TO BE SPRAYED ON. PROVIDE THREE (THREE-ROUNDED) TO MATCH FULL COLOR SATURATION AS REQUIRED.
8. WATER BLAST EXTERIOR FACE OF BUILDING WALLS PRIOR TO PAINT.
9. ALL CONCRETE PANEL JOINTS SHALL BE CLEANED OF DEBRIS BY PRESSURING WASHING THE CAVITY. GRIND ANY SHARP EDGES PRIOR TO APPLY PANEL CAULK JOINT.
10. ALL EXTERIOR DOORS AND LOUVERS SHALL BE FABRICATED AND WEATHER STRIPPED TO WITHSTAND WIND EXPOSURE "C"
11. CONTRACTOR TO PROVIDE MOCK UP PAINT AND FINISHES FOR OWNER AND ARCHITECT'S APPROVAL PRIOR TO COMMENCING THE WORK.
12. ALL FINISH MATERIAL SUCH AS ADHESIVES, SEALANTS, PRIMERS AND CAULKS SHALL COMPLY WITH LOCAL OR REGIONAL AIR POLLUTION CONTROL OR AIR QUALITY MANAGEMENT DISTRICT RULES WHERE APPLICABLE, OR SCAQMD RULE 1168 VOC LIMITS AS SHOWN ON TABLE 5.504.4.1 AND 5.504.4.2. SUCH PRODUCTS ALSO SHALL COMPLY WITH RULE 1168 PROHIBITION ON THE USER OF CERTAIN TOXIC COMPOUNDS (DICHLORIDE METHYLENE DICHLORIDE, METHYL ACETONE, CHLORIDE PERCHLOROETHYLENE AND TRICHLOROETHYLEE) EXCEPT FOR AEROSOL PRODUCTS AS SPECIFIED IN RR1168
13. AEROSOL ADHESIVES AND SMALLER UNIT SIZES OF ADHESIVES, AND SEALANT OR CAULKING COMPOUNDS (IN UNITS OF PRODUCTS, LESS PACKAGING, WHICH DO NOT WEIGH MORE THAN ONE POUND AND DO NOT CONSIST OF MORE THAN 16 FLUID OUNCES) SHALL COMPLY WITH STATE, FEDERAL VOC STANDARDS AND OTHER REQUIREMENTS, INCLUDING PROHIBITIONS ON USE OF CERTAIN TOXIC COMPOUNDS.

KEYNOTES

1. CONCRETE TILT UP WALL - SEE PAINT AND FINISH LEGEND 9/01.0 W/ WATERPROOF ALL WALLS WHERE GRADE IS HIGHER AND EXPOSED TO THE WEATHER USE SIDE. WATER PROOFING TO BE PROTECTED WITH PROTECTION BOARD AND A MINIMUM OF 9" OF GRAVEL PROVIDE TRENCH DRAIN AT BOTTOM AND DAYLIGHT TO CURB OR TAKE TO STORM DRAIN.
2. CONCRETE TILT PANEL JOINT - DETAIL 2/A5.02 AND NOTE 10 IN GENERAL NOTES
3. PAINTED CONCRETE REVEAL - DETAIL 1/A5.02

RESOLUTION NO. 2025-XX

A RESOLUTION OF THE PLANNING COMMISSION OF THE CITY OF RIALTO, CALIFORNIA, RECOMMENDING THAT THE CITY COUNCIL ADOPT AN ORDINANCE APPROVING A DEVELOPMENT AGREEMENT BETWEEN THE CITY OF RIALTO AND IV5 LOCUST GATEWAY LOGISTICS CENTER, LLC REGARDING THE LOCUST GATEWAY DEVELOPMENT PROJECT.

WHEREAS, the applicant, IV5 Locust Gateway Logistics Center LLC, ("Applicant") proposes to develop and operate a 664,859 square foot industrial warehouse building with associated paving, landscaping, fencing, lighting, and drainage improvements ("Project") on approximately 38.89 gross acres (38.78 net acres) of land (APN: 0239-192-23) located at the southwest corner of Locust Avenue and Lowell Street within the General Manufacturing (I-GM) land use district of the Rialto Airport Specific Plan ("Site"); and

WHEREAS, the Project is also referred to as the Locust Gateway Development Project; and

WHEREAS, in accordance with the provisions of Chapter 18.79 (Development Agreements) of the Rialto Municipal Code, the applicant intends to enter into a development agreement with the City of Rialto to memorialize certain benefits and terms related to the Project, and the applicant agreed to apply for Development Agreement No. 2024-0002 ("Development Agreement"); and

WHEREAS, in conjunction with the Project, the applicant has applied for Tentative Parcel Map No. 2023-0006, also referred to as Tentative Parcel Map No. 20809 ("TPM No. 20809") to provide public right-of-way dedications and to resolve underlying past recordings and instruments related to the Site; and

WHEREAS, in conjunction with the Project, the applicant has applied for Conditional Development Permit No. 2023-0032 ("CDP No. 2023-0032") to facilitate the development and operation of a 664,859 square foot industrial warehouse building on the Site; and

WHEREAS, in conjunction with the Project, the applicant has applied for Precise Plan of Design No. 2023-0041 ("PPD No. 2023-0041") to facilitate the development of a 664,859 square foot industrial warehouse building with associated paving, landscaping, fencing, lighting, and drainage improvements on the Site; and

WHEREAS, as part of the Development Agreement, the Applicant agrees to contribute $4,000,000 to the City of Rialto, prior to the issuance of a Certificate of Occupancy for the Project; and

WHEREAS, as part of the Development Agreement, City Council of the City of Rialto may use the $4,000,000 contribution at its sole discretion; and

WHEREAS, as part of the Development Agreement, the City of Rialto agrees to vest the Project entitlements for five (5) years, with a possible five (5) year extension, and freeze the Development Impact Fee rates for the Project at the current Fiscal Year 2025/2026 rates; and

WHEREAS, California Government Code Section 65864 and Chapter 18.79 of Title 18 of the Rialto Municipal Code authorizes the City Council to enter into development agreements; and

WHEREAS, pursuant to Section 18.79.040 of the Rialto Municipal Code, the Planning Commission shall hold a public hearing for any proposed development agreement and forward a recommendation to the City Council for action; and

WHEREAS, on December 17, 2025, the Planning Commission of the City of Rialto conducted a duly noticed public hearing, as required by law, on the Development Agreement, took testimony, at which time it received input from staff, the City Attorney, and the Applicant; heard public testimony; discussed the Development Agreement; closed the public hearing; and

WHEREAS, all legal prerequisites to the adoption of this Resolution have occurred.

NOW, THEREFORE, BE IT RESOLVED by the Planning Commission of the City of Rialto as follows:

SECTION 1. The Planning Commission hereby specifically finds that all of the facts set forth in the recitals above of this Resolution are true and correct and incorporated herein.

SECTION 2. An Environmental Impact Report (Environmental Assessment Review No. 2023-0051) has been prepared for the proposed Project in accordance with the California Environmental Quality Act (CEQA) and it has been determined that the Project will create unavoidable significant impacts to greenhouse gas emissions. On December 17, 2025, by Resolution No. _____, the Planning Commission recommended that the City Council certify the above-reference Environmental Impact Report, make certain findings, and adopt a Statement of Overriding

Considerations and a Mitigation Monitoring and Reporting Plan, which Resolution No. _____ together with the above-referenced Environmental Impact Report are incorporated herein by reference. The Planning Commission further finds that the Development Agreement is within the scope of the above-referenced Environmental Impact Report. Accordingly, the Planning Commission has forwarded, or is forwarding, a recommendation to the City Council to adopt the above-referenced Environmental Impact Report prepared for the Project.

SECTION 3. Based upon the forgoing and substantial evidence presented to the Planning Commission during the public hearing conducted with regard to the Development Agreement, including, but not limited to, written staff reports, verbal testimony, presentation by City staff, and other supporting documents, the Planning Commission hereby finds that the Development Agreement between the City of Rialto and the Applicant is consistent with the General Plan and the Rialto Airport Specific Plan because it will strengthen and diversify the economic base, provide employment opportunities, and maintain a positive business climate.

SECTION 4. Based upon the forgoing and substantial evidence presented to the Planning Commission during the public hearing conducted with regard to the Development Agreement, including, but not limited to, written staff reports, verbal testimony, presentation by City staff, and other supporting documents, the Planning Commission hereby recommends that the City Council adopt an Ordinance approving the Development Agreement between the City of Rialto and the Applicant, attached hereto as Exhibit A.

SECTION 5. The Chairman of the Planning Commission shall sign as to the passage and adoption of this resolution and thereupon the same shall take effect and be in force.

PASSED, APPROVED AND ADOPTED this 17th day of December, 2025.

EXHIBIT A

ORDINANCE NO. XXXX

AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF RIALTO, CALIFORNIA, APPROVING A DEVELOPMENT AGREEMENT BETWEEN THE CITY OF RIALTO AND IV5 LOCUST GATEWAY LOGISTICS CENTER, LLC REGARDING THE LOCUST GATEWAY DEVELOPMENT PROJECT.

WHEREAS, the applicant, IV5 Locust Gateway Logistics Center LLC, ("Applicant") proposes to develop and operate a 664,859 square foot industrial warehouse building with associated paving, landscaping, fencing, lighting, and drainage improvements ("Project") on approximately 38.89 gross acres (38.78 net acres) of land (APN: 0239-192-23) located at the southwest corner of Locust Avenue and Lowell Street within the General Manufacturing (I-GM) land use district of the Rialto Airport Specific Plan ("Site"); and

WHEREAS, the Project is also referred to as the Locust Gateway Development Project; and

WHEREAS, in accordance with the provisions of Chapter 18.79 (Development Agreements) of the Rialto Municipal Code, the applicant intends to enter into a development agreement with the City of Rialto to memorialize certain benefits and terms related to the Project, and the applicant agreed to apply for Development Agreement No. 2024-0002 ("Development Agreement"); and

WHEREAS, in conjunction with the Project, the applicant has applied for Tentative Parcel Map No. 2023-0006, also referred to as Tentative Parcel Map No. 20809 ("TPM No. 20809") to provide public right-of-way dedications and to resolve underlying past recordings and instruments related to the Site; and

WHEREAS, in conjunction with the Project, the applicant has applied for Conditional Development Permit No. 2023-0032 ("CDP No. 2023-0032") to facilitate the development and operation of a 664,859 square foot industrial warehouse building on the Site; and

WHEREAS, in conjunction with the Project, the applicant has applied for Precise Plan of Design No. 2023-0041 ("PPD No. 2023-0041") to facilitate the development of a 664,859 square foot industrial warehouse building with associated paving, landscaping, fencing, lighting, and drainage improvements on the Site; and

WHEREAS, as part of the Development Agreement, the Applicant agrees to contribute $4,000,000 to the City of Rialto, prior to the issuance of a Certificate of Occupancy for the Project; and

WHEREAS, as part of the Development Agreement, City Council of the City of Rialto may use the $4,000,000 contribution at its sole discretion; and

WHEREAS, as part of the Development Agreement, the City of Rialto agrees to vest the Project entitlements for five (5) years, with a possible five (5) year extension, and freeze the Development Impact Fee rates for the Project at the current Fiscal Year 2025/2026 rates; and

WHEREAS, California Government Code Section 65864 and Chapter 18.79 of Title 18 of the Rialto Municipal Code authorizes the City Council to enter into development agreements; and

WHEREAS, pursuant to Section 18.79.040 of the Rialto Municipal Code, the Planning Commission shall hold a public hearing for any proposed development agreement and forward a recommendation to the City Council for action; and

WHEREAS, on December 17, 2025, the Planning Commission of the City of Rialto conducted a duly noticed public hearing, as required by law, on the Development Agreement, took testimony, at which time it received input from staff, the City Attorney, and the Applicant; heard public testimony; discussed the Development Agreement; closed the public hearing; and adopted a resolution recommending that the City Council adopt an ordinance approving the Development Agreement; and

WHEREAS, on January 27, 2026, the City Council of the City of Rialto conducted a duly noticed public hearing, as required by law, on the Development Agreement, took testimony, at which time it received input from the staff, the City Attorney, and the Applicant; heard public testimony; discussed the Development Agreement; and closed the public hearing; and

NOW THEREFORE, THE CITY COUNCIL AND RIALTO HOUSING AUTHORITY OF THE CITY OF RIALTO FINDS AND ORDAINS AS FOLLOWS:

Section 1. The above recitals are all true and correct and are hereby adopted as findings.

Section 2. An Environmental Impact Report (Environmental Assessment Review No. 2023-0051) has been prepared for the proposed Project in accordance with the California Environmental Quality Act (CEQA) and it has been determined that the Project will create unavoidable significant

impacts to greenhouse gas emissions. On January 27, 2026, by Resolution No. _____, the City Council certified the above-reference Environmental Impact Report, made certain findings, and adopted a Statement of Overriding Considerations and a Mitigation Monitoring and Reporting Plan, which Resolution together with the above-referenced Environmental Impact Report are incorporated herein by reference. The City Council finds that the Development Agreement is within the scope of the above-referenced Environmental Impact Report.

Section 3. Based upon the forgoing and substantial evidence presented to the City Council, including, but not limited to, the staff report to the City Council, the presentation to the City Council, supporting documents, and public testimony, the City Council finds that the Development Agreement between the City of Rialto and the Applicant, attached hereto as Exhibit A, is consistent with the General Plan and the Rialto Airport Specific Plan because it will strengthen and diversify the economic base, provide employment opportunities, and maintain a positive business climate.

Section 4. Based upon the forgoing and substantial evidence presented to the City Council, including, but not limited to, the staff report to the City Council, the presentation to the City Council, supporting documents, and public testimony, the Development Agreement between the City of Rialto and the Applicant, as set forth in Exhibit A, is hereby approved, subject to minor, conforming and clarifying changes consistent with the terms thereof as may be approved by the City Manager in consultation with the City Attorney. The City Council hereby authorizes the City Manager to execute the Development Agreement and all documents required to implement the Development Agreement on behalf of the City.

Section 5. The City Clerk shall certify to the adoption of this Ordinance, and cause the same to be published in the local newspaper, and the same shall take effect thirty (30) days after its date of adoption.

PASSED, APPROVED AND ADOPTED this ____ day of _____, 2026.

DEVELOPMENT AGREEMENT

THIS DEVELOPMENT AGREEMENT ("**Agreement**") dated for reference purposes as of _____, 2026 ("**Agreement Date**"), is entered into by and between IV5 Locust Gateway Logistics Center, LLC ("**Developer**") and the CITY OF RIALTO, a California municipal corporation ("**City**"). Developer and City are sometimes referred to individually herein as a "**Party**" and collectively as the "**Parties**."

RECITALS

This Agreement is entered into on the basis of the following facts, understandings and intentions of the Parties. The following recitals are a substantive part of this Agreement; capitalized terms used herein and not otherwise defined are defined in Article 1 of this Agreement.

A. In order to strengthen the public planning process, encourage private participation in comprehensive planning and reduce the economic costs and risks of development, the Legislature of the State of California enacted section 65864 *et seq*. of the Government Code ("**Development Agreement Statute**"), which authorizes a city and a developer having a legal or equitable interest in real property to enter into a binding, long-term development agreement, establishing certain development rights in the property.

B. In accordance with the Development Agreement Statute, the City Council has adopted a development agreement ordinance codified as Chapter 18.79 of the City's Municipal Code ("**Development Agreement Ordinance**"), which authorizes the execution of development agreements and sets forth the required contents and form of those agreements. The provisions of the Development Agreement Statute and the City's Development Agreement Ordinance are collectively referred to herein as the "**Development Agreement Law**."

C. Developer is the fee owner of that certain real property consisting of approximately 39.91 acres located at the southwest corner of Locust Avenue and Lowell Street, designated as APN: 0239-192-23 and more particularly described and depicted in Exhibit A attached hereto and incorporated herein ("**Property**"). The Property is currently undeveloped.

D. Developer intends to develop the Property with an approximately 665,000 square foot industrial warehouse building and associated paving, landscaping, lighting, fencing, and drainage improvements, as more particularly shown in those certain Development Plans, prepared by [_____], dated _____, 202_, entitled "Planning Package for ____ Locust Gateway Development Project" ("**Project**"). The Project site plan is depicted in Exhibit B.

E. This Agreement sets forth, among other things, the applicable fees, policies and zoning requirements that apply to development of the Project, and provides Developer with a vested right to develop the Project on the Property in accordance with the entitlements approved by the City for the Project as well as the City's General Plan, and the other relevant land use designations and zoning provisions applicable to the Property, each as in effect as of the Effective Date, and more particularly defined in Recital H, below as "Existing Approvals" and this Agreement.

F. The City has prepared a draft Initial Study and Environmental Impact Report for the Project ("**EIR**") and held hearings pursuant to the California Environmental Quality Act ("**CEQA**") (Public Resources Code §§ 21000 *et seq.*). On _____, 202_, the City circulated the Draft EIR for public review and comment for a period through _____, 202_. City published the Final EIR, including Response to Comments, on _____, 202_.

G. The Planning Commission on _____, 202_, recommended the following action by adoption of Resolutions Nos. _____ and _____ to the City Council: certification of the EIR, approval of Tentative Parcel Map No. 2023-0006, Conditional Development Permit No. 2023-0032, Precise Plan of Design No. 2023-0041, and this Agreement.

H. Prior to or concurrently with approval of this Agreement, the City has taken or will take the following actions to review and plan for the future development and use of the Project (collectively, the "**Existing Approvals**"):

1. Certification of the EIR by Resolution No. 20__-____ adopted by the City Council on _____, 20__;

2. Adoption of the Mitigation Monitoring and Reporting Program by Resolution No. 20__-____, adopted by the City Council on _____, 20__;

3. Approval of Tentative Parcel Map No. 2023-0006, by Resolution No. 20__-____, adopted by the City Council on _____, 20__; and

4. Approval of Conditional Development Permit No. 2023-0032, by Resolution No. 20__-____, adopted by the City Council on _____, 20__; and

5. Approval of Precise Plan of Design No. 2023-0041, by Resolution No. 20__-____, adopted by the City Council on _____, 20__.

I. Under this Agreement, Developer will provide substantial public benefits in connection with the Project including a contribution of $4,000,000 to the City in community benefits, as more specifically described in Article 6 and Exhibit D to this Agreement.

J. City has determined that by entering into this Agreement, City will further the purposes set forth in the Development Agreement Ordinance and City will benefit from public benefits provided by the Developer to complete improvements within the Rialto Airport Specific Plan area and other areas of the City, with specific projects yet to be determined by the City Council.

K. For the reasons recited herein, City and Developer have determined that the Project is a development for which this Agreement is appropriate. This Agreement will eliminate uncertainty regarding Project Approvals, thereby encouraging planning for, investment in, and commitment to use and development of the Property. Development of the Property in accordance with the terms of this Agreement will in turn provide substantial public benefits to the City, thereby achieving the goals and purposes for which the Development Agreement Law was enacted.

L. The terms and conditions of this Agreement have undergone review by City staff,

the Planning Commission and the City Council at publicly noticed meetings, and have been found to be fair, just and reasonable, in conformance with the Development Agreement Law and the goals, policies, standards and land use designations specified in the General Plan, and consistent with the requirement under Government Code Section 65867.5, and further, the City Council finds that the economic interests of City's citizens and the public health, safety and welfare will be best served by entering into this Agreement.

M. City has approved this Agreement by Ordinance No. ____, adopted by the City Council on _____, 202_ ("**Enacting Ordinance**").

NOW, THEREFORE, in consideration of the mutual promises, covenants and provisions set forth herein, the receipt and adequacy of which are hereby acknowledged, the Parties agree as follows:

AGREEMENT

ARTICLE 1.
DEFINITIONS

Definitions.

"**Agreement**" means this Development Agreement.

"**Agreement Date**" means the reference date identified in the preamble to this Agreement.

"**Annual Review Form**" is defined in Section 7.2.1.

"**Applicable City Regulations**" means (a) the permitted uses of the Property, , the regulations for industrial uses, the intensity of use, the height, bulk and space requirements, including massing, of the proposed buildings, off-street parking and loading, provisions for reservation or dedication of land for public purposes, the conditions, terms, restrictions, and requirements for subsequent discretionary actions, the provisions for public improvements and financing of public improvements, and other terms and conditions of development applicable to the Property as set forth in the General Plan of the City on the Effective Date, the Municipal Code of the City on the Effective Date, and the other ordinances, policies, rules, regulations, standards and specifications of the City in effect on the Effective Date; (b) New City Laws that apply to the Property as set forth in Section 4.3.3, 4.3.4 or 4.3.6 herein; and (c) regulations that apply to the Property as set forth in Section 4.3.1 and 4.3.2 herein.

"**Applicable Law**" means (a) all State and Federal laws and regulations applicable to the Property and the Project as enacted, adopted and amended from time to time and (b) the Applicable City Regulations.

"**CEQA**" is defined in Recital F.

"**Changes in the Law**" is defined in Section 4.3.6.

"**City**" means city of Rialto, a California municipal corporation.

"**City Council**" means City Council of the City of Rialto.

"City Parties" means the City and its elected Councilmembers, boards, commissioners, officers, agents, and employees.

"City Manager" means the City of Rialto's City Manager, or his or her designee.

"**Claims**" means liabilities, obligations, orders, claims, losses, damages, fines, penalties and expenses, including, but not limited to, reasonable attorneys' fees and costs.

"**Connection Fees**" means those fees charged by City or by a utility provider to utility users as a cost for connecting to water, sanitary sewer and other applicable utilities.

"**Default**" is defined in Section 12.1.

"**Developer**" means IV5 Locust Gateway Logistics Center, LLC and its successors and assigns.

"**Development Agreement Law**" is defined in Recital B.

"**Development Agreement Ordinance**" is defined in Recital B.

"**Development Agreement Statute**" is defined in Recital A.

"**Effective Date**" is defined in Section 3.1.

"**Enacting Ordinance**" is defined in Recital M.

"Environmental Impact Report" or **"EIR"** is defined in Recital F.

"**Exactions**" means exactions imposed by City as a condition of developing the Project as more particularly set forth in Section 5.2 and in connection with Subsequent Project Approvals, as set forth in Section 11.2 of this Agreement which may include requirements for acquisition, dedication or reservation of land; and obligations to construct on-site or off-site public and private infrastructure improvements such as roadways, utilities or other improvements necessary to support the Project, whether such exactions constitute subdivision improvements, mitigation measures in connection with environmental review of the Project, or impositions made under Applicable City Regulations. For purposes of this Agreement, Exactions do not include Impact Fees.

"**Existing Approvals**" is defined in Recital H.

"**General Plan**" means the General Plan of the City of Rialto in effect as of the Effective Date.

"**Impact Fees**" means the monetary fees and impositions more particularly set forth in Section 5.1.1, below and in Exhibit C, attached, hereto, other than taxes and assessments, charged by City in connection with a development project for the purpose of defraying all or a portion of the cost of mitigating the impacts of a development project or development of the public facilities

and services related to a development project, including any "fee" as that term is defined by Government Code section 66000(b). For purposes of this Agreement, a monetary fee or imposition that meets both the definition of an Impact Fee and the definition of an Exaction will be considered an Impact Fee.

"**Initial Term**" is defined in Section 3.2.1.

"**Insubstantial Amendment**" is defined in Section 9.2.

"**Litigation Challenge**" is defined in Section 11.6.2.

"**MMRP**" means the Mitigation Monitoring and Reporting Program adopted by the City Council in connection with its certification of the EIR.

"**Mortgage**" is defined in Section 8.1.

"**Mortgagee**" is defined in Section 8.1.

"**Municipal Code**" means the Municipal Code of the City of Rialto in effect as of the Effective Date.

"**New City Laws**" means and includes any ordinances, resolutions, orders, rules, official policies, standards, specifications, guidelines or other regulations, which are promulgated or adopted by the City (including but not limited to any City agency, body, department, officer or employee) or its electorate (through the power of initiative or otherwise) after the Effective Date.

"**Notice**" is defined in Section 13.7.

"**Other Agency Fees**" is defined in Section 5.1.4.

"**Other Agency Subsequent Project Approvals**" means Subsequent Project Approvals to be obtained from entities other than City.

"**Party/Parties**" is defined in the introductory paragraph preceding the Recitals of this Agreement.

"**Permitted Delay**" is defined in Section 13.2.

"**Planning Commission**" means the Planning Commission of the City of Rialto.

"**Prevailing Wage Laws**" is defined in Section 5.3.

"**Processing Fees**" means all fees charged on a City-wide basis to cover the cost of City processing of development project applications, including any required supplemental or other further environmental review, plan checking (time and materials) and inspection and monitoring for land use approvals, design review, grading and building permits, General Plan maintenance fees, and other permits and entitlements required to implement the Project, which are in effect at the time those permits, approvals or entitlements are applied for, and which fees are intended to cover the City's actual and reasonable costs of processing the foregoing.

"**Project**" is defined in Recital D.

"**Project Approvals**" means the Existing Approvals and, when and as approved in accordance with the terms of this Agreement, the Subsequent Project Approvals.

"**Property**" is defined in Recital C.

"**Subsequent Project Approvals**" is defined in Section 11.1.

"**Term**" is defined in Section 3.2.1.

ARTICLE 2.
GENERAL PROVISIONS

Ownership of Property. The Parties hereby acknowledge that, as of the Effective Date, Developer has a fee interest in the Property.

ARTICLE 3.
EFFECTIVE DATE; OPERATIVE DATE; TERM; FORCE MAJEURE; REPRESENTATIONS

Effective Date. This Agreement shall become effective the date that is thirty (30) days after the date the Enacting Ordinance is adopted ("**Effective Date**").

Term.

3.2.1 Term of Agreement. The "**Term**" of this Agreement shall commence on the Effective Date and shall expire on the fifth (5th) anniversary of the Effective Date, unless extended or earlier terminated as provided herein.

3.2.2 Extension of Term. Upon Developer's request made by Notice given no earlier than six (6) months, but no later than two (2) months, prior to expiration of the original Term, the Term of this Agreement shall be automatically extended for one (1) additional five (5) year period beyond the original Term, so long as Developer is not, as of the date of the Notice, in material uncured breach of this Agreement and is not in the process of curing said breach, as determined by City following a special review pursuant to Article 6, so long as City undertakes the special review on its own initiative and completes the special review no later than six (6) months prior to expiration of the original Term.

3.2.3 Upon extension of the Term in accordance with Section 3.2.2, City will execute, in recordable form, any instrument which Developer may reasonably require to evidence the extension, provided that Developer requests in writing that the City execute such instrument.

3.2.4 Effect of Termination. Upon the expiration of the Term, this Agreement shall be deemed terminated and of no further force and effect, subject, however, to the provisions set forth in Section 12.7.

City Representations and Warranties. City represents and warrants to Developer that:

3.3.1 City is a municipal corporation, and has all necessary powers under the laws of the State of California to enter into and perform the undertakings and obligations of City under this Agreement.

3.3.2 The execution and delivery of this Agreement and the performance of the obligations of City hereunder have been duly authorized by all necessary City Council action and all necessary approvals have been obtained.

3.3.3 This Agreement is a valid obligation of City and is enforceable in accordance with its terms.

3.3.4 The foregoing representations and warranties are made as of the Agreement Date. During the Term of this Agreement, City shall, upon learning of any fact or condition which would cause any of the warranties and representations in this Section 3.3 not to be true, immediately give written Notice of such fact or condition to Developer.

Developer Representations and Warranties. Developer represents and warrants to City that:

3.4.1 Developer is duly organized, validly existing and in good standing under the laws of the State of California and has all necessary powers under the laws of the State of California to own property interests and in all other respects enter into and perform the undertakings and obligations of Developer under this Agreement.

3.4.2 The execution and delivery of this Agreement and the performance of the obligations of Developer hereunder have been duly authorized by all necessary corporate, partnership or company action and all necessary shareholder, member or partner approvals have been obtained.

3.4.3 This Agreement is a valid obligation of Developer and is enforceable in accordance with its terms.

3.4.4 Developer has not (i) made a general assignment for the benefit of creditors, (ii) filed any voluntary petition in bankruptcy or suffered the filing of any involuntary petition by Developer's creditors, (iii) suffered the appointment of a receiver to take possession of all, or substantially all, of Developer's assets, (iv) suffered the attachment or other judicial seizure of all, or substantially all, of Developer's assets, (v) admitted in writing its inability to pay its debts as they come due, or (vi) made an offer of settlement, extension or composition to its creditors generally.

The foregoing representations and warranties are made as of the Agreement Date. During the Term of this Agreement, Developer shall, upon learning of any fact or condition which would cause any of the warranties and representations in this Section 3.4 not to be true, immediately give written Notice of such fact or condition to City.

ARTICLE 4.
DEVELOPMENT OF PROPERTY

Vested Rights. City hereby grants to Developer a vested right to develop and construct the Project at the Property, including all on-site and off-site improvements authorized by, and in accordance with, the Project Approvals. Except as otherwise provided in this Agreement, no New City Laws that conflict with this Agreement, the Applicable City Regulations, or the Project Approvals shall apply to the Project or the Property. For purposes of this Section and Section 4.3, the word "**conflict**" means any modifications that purport to: (i) limit the Project Approvals, including but not limited to the permitted uses of the Property, the intensity of use, the height, bulk and space requirements, including massing and location, of the proposed buildings, and off-street parking and loading,; (ii) impose requirements for reservation or dedication of land for public purposes or requirements for infrastructure, public improvements, or public utilities, other than as provided in the Project Approvals; (iii) impose conditions upon development of the Property other than as permitted by Applicable Law, Changes in the Law, and the Project Approvals; (iv) limit the timing, phasing, sequencing, or rate of development of the Property; (v) limit the location of building sites, grading or other improvements on the Property in a manner that is inconsistent with the Existing Approvals; (vi) limit or control the ability to obtain public utilities, services, infrastructure, or facilities (provided, however, nothing herein shall be deemed to exempt the Project or the Property from any water use rationing requirements that may be imposed on a City-wide basis from time to time in the future or be construed as a reservation of any existing sanitary sewer or potable water capacity); (vii) require the issuance of additional permits or approvals by the City other than those required by Applicable Law and the Existing Approvals; (viii) increase the permitted Impact Fees or add new Impact Fees, except as permitted by Section 5.1 of this Agreement; (ix) establish, enact, increase, or impose against the Project or the Property any special taxes or assessments other than those specifically permitted by this Agreement, including Section 5.5; or (x) impose against the Project any condition, dedication or other Exaction not specifically authorized by Applicable Law or the Project Approvals. To the extent that New City Laws conflict with the vested rights granted pursuant to this Agreement, they shall not apply to the Property or the Project, except as provided in Section 4.3, below.

Development and Design Standards. The Project shall be developed in conformance with the Existing Approvals and Applicable City Regulations, including the General Plan and the zoning in effect as of the Effective Date. The design, permitted uses, FAR, maximum height and size of buildings, massing and location regulations, number and type of parking spaces and loading docks, and development standards shall all be in accordance with the Existing Approvals and Applicable City Regulations.

Reservations of Authority. Notwithstanding any other provision of this Agreement to the contrary, the following regulations and provisions shall apply to the development of the Project:

4.3.1 Procedural Rules. Regulations relating to hearing bodies, petitions, applications, notices, findings, records, hearings, reports, recommendations, appeals and any other matter of procedure then applicable in City at the time of building permit application;

4.3.2 Uniform Construction Codes. Regulations governing construction standards and specifications, including but not limited to City's building code, plumbing code, mechanical code, electrical code, fire code and grading code, and all other uniform construction codes then applicable in City at the time of building permit application;

4.3.3 New City Laws Not in Conflict. New City Laws applicable to the Property or Project, which do not conflict with this Agreement or the Project Approvals, including but not limited to Developer's vested rights under Section 4.1 above;

4.3.4 New City Laws- Health and Safety. New City Laws which may be in conflict with this Agreement, but which are necessary to protect the physical health and safety of the public.

4.3.5 Exactions. Exactions for Subsequent Project Approvals, if applicable, permitted by Section 11.2.

4.3.6 Changes in the Law. As provided in Section 65869.5 of the Development Agreement Law, this Agreement shall not preclude the applicability to the Project of changes in laws, regulations, plans or policies, to the extent that such changes are specifically mandated and required by changes in State or Federal laws or by changes in laws, regulations, plans or policies of special districts or other governmental entities, other than the City, created or operating pursuant to the laws of the State of California ("**Changes in the Law**"). In the event Changes in the Law prevent or preclude compliance with one or more provisions of this Agreement, the Parties shall meet and confer in good faith in order to determine whether such provisions of this Agreement shall be modified or suspended, or performance thereof delayed, as may be necessary to comply with Changes in the Law. Following the meeting between the Parties, the provisions of this Agreement may, to the extent feasible, and upon mutual agreement of the Parties, be modified or suspended, but only to the minimum extent necessary to comply with such Changes in the Law. In such event, this Agreement together with any required modifications shall continue in full force and effect. Nothing in this Agreement shall preclude Developer from contesting by any available means (including administrative or judicial proceedings) such Changes in the Law or their applicability to the Project and, in the event that such challenge is successful, this Agreement shall remain unmodified and in full force and effect, unless the Parties mutually agree otherwise.

Regulation by Other Public Agencies. Developer acknowledges and agrees that other public agencies not within the control of City may possess authority to regulate aspects of the development of the Property separately from or jointly with City, and this Agreement does not limit the authority of such other public agencies. Developer shall, at the time required by Developer in accordance with Developer's construction schedule, apply for all such other permits and approvals as may be required by other governmental or quasi-governmental entities in connection with the development of, or the provision of services to, the Project. Developer shall also pay all required fees when due to such public agencies. Developer acknowledges that City does not control the amount of any such fees. City shall reasonably cooperate with Developer in Developer's effort to obtain such permits and approvals; provided, however, City shall have no obligation to incur any costs, without compensation or reimbursement by Developer, or to amend any policy, regulation or ordinance of City in connection therewith.

Life of Project Approvals. The term of any and all Project Approvals shall automatically be extended for the longer of the Term of this Agreement or the term otherwise applicable to such Project Approvals.

Initiatives. If any New City Law is enacted or imposed by an initiative or referendum, which New City Law would conflict with the Project Approvals or this Agreement or reduce the development rights or assurances provided by this Agreement, such New City Law shall not apply to the Property or Project; provided, however, the Parties acknowledge that City's approval of this Agreement is a legislative action subject to referendum. Without limiting the generality of the foregoing, no moratorium or other limitation (whether relating to the rate, timing, phasing or sequencing of development, whether imposed by ordinance, initiative, resolution, policy, order or otherwise, and whether enacted by the City Council, an agency of City, the electorate, or otherwise) affecting subdivision maps, use permits, building permits, occupancy permits, or other entitlements to use that are approved or to be approved, issued or granted by City shall apply to the Property or Project. Developer agrees and understands that City does not have authority or jurisdiction over any other public agency's ability to grant governmental approvals or permits or to impose a moratorium or other limitations that may affect the Project. City shall reasonably cooperate with Developer and, at Developer's expense, shall undertake such actions as may be necessary to ensure this Agreement remains in full force and effect. City, except to submit to vote of the electorate initiatives and referendums required by law to be placed on a ballot and fulfill any legal responsibility to defend a ballot measure passed by its voters, shall not support, adopt or enact any New City Law, or take any other action which would violate the express provisions or spirit and intent of this Agreement.

Timing of Development. Developer shall meet its obligation to provide the public benefits described in Article 6 within the times provided therein. However, and not in limitation of any of the foregoing, since the California Supreme Court held in *Pardee Construction Co. v. City of Camarillo*, 37 Cal.3d 465 (1984), that the failure of the parties therein to consider, and expressly provide for, the timing of development resulted in a later-adopted initiative restricting the timing of development to prevail over such parties' agreement, it is the desire of the Parties hereto to avoid that result. Therefore, notwithstanding the adoption of an initiative after the Effective Date by City's electorate to the contrary, the Parties acknowledge that, except as otherwise provided for in the Existing Approvals, Developer shall have the vested right (but not the obligation) to develop the Project in such order and at such rate and at such times as Developer deems appropriate in the exercise of its business judgment.

Expansion of Development Rights. If any New City Laws or Changes in Law expand, extend, enlarge or broaden Developer's rights to develop the Project, then, (a) if such law is mandatory, the provisions of this Agreement shall be modified as may be necessary to comply or conform with such new law, and (b) if such law is permissive, the provisions of this Agreement may be modified by mutual written agreement of the Parties. Immediately after enactment of any such new mandatory law, upon Developer's written request, the Parties shall meet and confer in good faith for a period not exceeding sixty (60) days (unless such period is extended by mutual written consent of the Parties) to prepare such modification, and Developer shall have the right to challenge City's refusal to apply any new law mandating expansion of Developer's rights under this Agreement, and in the event such challenge is successful, this Development Agreement shall be modified to comply with, or conform to, the new law. After enactment of any such new permissive law, upon Developer's written request, the Parties shall meet and confer in good faith for a period not exceeding sixty (60) days (unless such period is extended by written consent of the Parties) to discuss and, if applicable, prepare such proposed modification, provided that such modification shall be subject to City's written approval in its sole and absolute discretion,

No Reservation of Sanitary Sewer or Potable Water Capacity. City has found the Project to be consistent with the General Plan which anticipates that there will be sufficient potable water and sanitary sewer capacity to serve future development contemplated by the General Plan, including the Project. However, nothing in this Agreement is intended to exempt the Project from any water use rationing requirements that may be imposed on a City-wide basis from time to time in the future or be construed as a reservation of any existing sanitary sewer or potable water capacity.

ARTICLE 5.
OTHER RIGHTS AND OBLIGATIONS OF THE PARTIES

Fees.

5.1.1 Impact Fees. City and Developer understand and agree that the Impact Fees associated with the Project are as set forth in Exhibit C, attached hereto, are a material consideration for Developer agreeing to develop the Project, whereby the Developer shall pay the Impact Fees prior to issuance of the final Certificate of Occupancy for the building shown in the Existing Approvals. Once the Impact Fees are paid Developer shall not be required to re-pay the Impact fees in the event of an act of God which requires re-construction of the project according to the Existing Approvals. For the period commencing on the Effective Date and continuing until expiration of the Impact Fee Limitation Period (defined below), Developer shall pay when due all existing Impact Fees applicable to the Project in accordance with this Agreement in effect as of the Agreement Date at the lower of (i) the rates in effect as of the Agreement Date, including all existing fee escalation provisions or (ii) the rates in effect when such existing Impact Fees are due and payable, and shall not be required to pay any escalations in such Impact Fees in excess of the fee escalation provisions in any Impact Fee in effect as of the Agreement Date or new Impact Fees enacted or established after the Agreement Date. As used herein the term "**Impact Fee Limitation Period**" means the period commencing on the Effective Date and expiring on the 10th anniversary thereof. Except as otherwise provided in this Section 5.1.1, Developer agrees to pay when due any and all existing, increased or modified Impact Fees, at the rates then in effect at the time Certificates of Occupancy are issued on any or all portions of the Project so long as any new fees or increases in existing fees from the amount existing as of the Agreement Date are uniformly applied by City to all substantially similar types of development projects and properties and are consistent with the provisions of applicable California law, including the provisions of Government Code Section 66000 et seq., and all applicable nexus and rough proportionality tests and other legal requirements.

5.1.2 Processing Fees. Subject to Developer's right to protest and/or pursue a challenge in law or equity to any new or increased Processing Fees, City may charge and Developer agrees to pay all Processing Fees which are in effect on a City-wide basis at the time permits, approvals or entitlements are applied for.

5.1.3 Connection Fees. Developer shall pay connection fees assessed by utility providers and other agencies assessing such fees at the rates in effect from time to time.

5.1.4 Other Agency Fees. Nothing in this Agreement shall preclude City from collecting fees from Developer that are lawfully imposed on the Project by another agency having

jurisdiction over the Project, which the City is required to collect pursuant to Applicable Law ("**Other Agency Fees**").

Exactions. City may impose and Developer shall comply with those Exactions required by this Agreement and the Existing Approvals, and Subsequent Project Approvals, if applicable, in accordance with Section 11.2 below.

Prevailing Wage.

5.3.1 Prevailing Wage Indemnity. Developer shall defend (with counsel reasonably acceptable to the City), indemnify, assume all responsibility for, and hold harmless City Parties from and against any and all present and future Claims arising out of or in any way connected with Developer's or its contractors' or subcontractors' obligations to comply with all State Labor Code requirements and implementing regulations of the Department of Industrial Relations pertaining to "public works," including the payment of prevailing wages for any work identified in the Existing Approvals that may constitute a "public work" (collectively, "**Prevailing Wage Laws**"), including all Claims that may be made by contractors, subcontractors or other third party claimants pursuant to Labor Code sections 1726 and 1781.

5.3.2 Release of City. Developer hereby waives and releases City Parties from any and all manner of Claims or other compensation whatsoever, in law or equity, of whatever kind or nature, whether known or unknown, direct or indirect, foreseeable or unforeseeable, absolute or contingent, now existing or which may in the future arise, including lost business opportunities or economic advantage, and special and consequential damages, arising out of directly or directly, or in any way connected with Developer's obligation to comply with all Prevailing Wage Laws. Developer is aware of and familiar with the provisions of Section 1542 of the California Civil Code which provides as follows:

> A GENERAL RELEASE DOES NOT EXTEND TO CLAIMS THAT THE CREDITOR OR RELEASING PARTY DOES NOT KNOW OR SUSPECT TO EXIST IN HIS OR HER FAVOR AT THE TIME OF EXECUTING THE RELEASE AND THAT, IF KNOWN BY HIM OR HER, WOULD HAVE MATERIALLY AFFECTED HIS OR HER SETTLEMENT WITH THE DEBTOR OR RELEASED PARTY.
>
> INITIALS: DEVELOPER _____

5.3.2 This Section 5.3 shall survive the expiration or sooner termination of this Agreement.

Other Financing Mechanisms. Without limitation of and in addition to the provisions of this Agreement, upon Developer's request, City will give good faith consideration to establishing any other mechanism that is legal and available to the City to aid in financing the construction of Project facilities and infrastructure. These mechanisms may include, without limitation, direct funding of condemnation costs and construction costs, acquisition of improvements, establishing reserve accounts to fund capital improvement program projects, Landscaping and Lighting Districts, Geological Hazard Abatement Districts or other similar mechanisms. Any such request by Developer must be made to the City Manager in written form and must outline the purposes for

which any such mechanism will be established or issued, the general terms and conditions upon which it will be established or issued and a proposed timeline for its establishment or issuance. City reserves full and complete discretion with respect to consideration of any proposed alternative funding mechanisms and nothing in this Agreement is intended to or shall limit City's ability to approve or disapprove such mechanisms in its sole discretion and nothing in this Agreement is intended to or shall prejudge or commit to City regarding the findings and determinations to be made with respect thereto.

Taxes and Assessments. Developer covenants and agrees to pay prior to delinquency all existing taxes and assessments and any and all new taxes or assessments that are adopted after the Effective Date and which conform to the terms of this Agreement, including this Section. As of the Agreement Date, City is unaware of any pending efforts to initiate, or consider applications for new or increased special taxes or assessments covering the Property, or any portion thereof. City shall retain the ability to initiate or process applications for the formation of new assessment districts or imposition of new taxes covering all or any portion of the Property. City may impose new taxes and assessments, other than Impact Fees, on the Property in accordance with the then applicable laws, but only if such taxes or assessments are adopted by or after Citywide voter approval, or approval by landowners subject to such taxes or assessments, and are imposed on other land and projects of the same category within the jurisdiction of City in a reasonably proportional manner as determined by City, and, as to assessments, only if the impact thereof does not fall disproportionately on the Property as compared to the benefits accruing to the Property as indicated in the engineers report for such assessment district. Nothing herein shall be construed so as to limit Developer from exercising whatever rights it may otherwise have in connection with protesting or otherwise objecting to the imposition of taxes or assessments on the Property.

5.5.1 Tax Localization Plan and Requirements.

(a) Developer shall use commercially reasonable efforts to require the incorporation of requirements substantially in the form set forth in Exhibit F in its contracts with general contractors performing work at the Project Site, in connection with causing sales and use tax arising from purchases of materials, fixtures or equipment for the Project to be allocated to the City, to the extent allowed by law (the "**Tax Localization Plan**"). Developer shall use commercially reasonable efforts to direct its general contractors to comply with the Tax Localization Plan. In order to monitor compliance with the Tax Localization Plan, Developer shall designate a representative for the purpose of semiannual review with the City of relevant documents and filings with the State Board of Equalization that are not subject to a confidentiality agreement. Developer shall be responsible for the administrative expenses incurred in connection with the implementation of the Tax Localization Plan and, further, Developer shall assist City, at Developer's sole expense, in defending against any administrative proceedings instituted by the State Board of Equalization or the California Department of Tax and Fee Administration ("CDTFA") relating to whether the City is the proper point of sale location.

5.6 City Acceptance of Project Offsite Public Improvements. City agrees and acknowledges that City's timely acceptance of the Project Offsite Public Improvements upon their completion is crucial for the release of Developer's bonds for the improvements, provided that the Project Offsite Public Improvements are constructed in accordance with the City's requirements, including, but not limited to, the City's standard plans and drawings for public improvements,

Standard Specifications for Public Works Construction or Caltrans Standard Specifications ("Public Improvements Requirements"). After the completion of the Project Offsite Public Improvements, Developer shall notify City in writing of such completion. Within thirty (30) days of receipt of such notice, the City's Director of Public Works/City Engineer (or his or her designee) shall review the Project Offsite Public Improvements to determine compliance thereof with the Public Improvements Requirements, and shall provide notice of such determination to Developer. If City's Director of Public Works/City Engineer (or his or her designee) determines that the Project Offsite Public Improvements are in compliance with the Public Improvements Requirements, then City shall accept the Project Offsite Public Improvements. In the event that the City's Director of Public Works/City Engineer (or his or her designee) determines that the Project Offsite Public Improvements are not in compliance with the Public Improvements Requirements, Developer shall carry out such work as may be required to achieve such compliance.

ARTICLE 6.
PUBLIC BENEFITS

In consideration of the rights and benefits conferred by City to Developer under this Agreement, upon issuance of a Certificate of Occupancy for the building shown in the Existing Approvals, Developer shall perform and provide the Public Benefit obligations described in Exhibit D, some of which exceed those dedications, conditions, and exactions which may be imposed under Applicable Law. Once the Public Benefits are paid, Developer shall not be required to re-pay the Public Benefit fees in the event of an act of God which requires re-construction of the project according to the Existing Approvals.

ARTICLE 7.
ANNUAL REVIEW
