## 1. INTRODUCTION

The Foothill Freeway, State Route 210 (SR-210), is a major east-west transportation route within San Bernardino County and is an integral part of the freeway network for the Southern California metropolitan area. In an effort to improve traffic operations along Alder Avenue, the City of Rialto (City), in cooperation with the California Department of Transportation (Caltrans) District 8, is proposing improvements on Alder Avenue between Casmalia Street and Renaissance Parkway near the State Route 210 interchange (Proposed Project). These improvements are recommended to accommodate projected traffic demand from various development projects, including the new Renaissance Community project, which will use 1,439 acres of land to build a variety of developments, including housing, business, schools, and other projects.

This Feasibility Study Report discusses the proposed roadway improvements at the Alder Avenue and SR-210 Interchange. This area is projected to experience substantial growth from planned development projects. To accommodate this forecasted growth, Alder Avenue will be restriped and widened in certain locations. This study provides the background data needed to evaluate improvements and highlights the proposed project features needed to accommodate the development in the surrounding area.

The proposed improvements will:

- Accommodate projected year (2040) traffic volumes
- Improve existing intersection operation
- Facilitate traffic operations generated from regional growth and new residential and commercial developments within community

## 2. BACKGROUND

SR-210 is an east-west transportation route within Los Angeles and San Bernardino counties. It connects Los Angeles metropolitan area with southwest San Bernardino County. The west terminus is located at its junction with I-5 in Sylmar. Its east terminus is located at the junction with I-10 in Redlands. SR-210 is a Surface Transportation Assistance Act (STAA) Route for use by oversized trucks. At the location of the Proposed Project, SR-210 is a divided 8-lane freeway. It has three mixed-flow lanes and one High Occupancy Vehicle (HOV) lane in each direction.

Alder Avenue is a north-south arterial in the City of Rialto providing access throughout the City. Per the Renaissance Specific Plan, figure 3-1 Vehicular Circulation Plan, Alder Avenue is identified as a major arterial. Currently, it is a 4-lane divided roadway with left turn pockets, a median, curbs and sidewalks to the north and south of the interchange. Alder Avenue ends at Lake Padden Lane located approximately 3500 feet north of the intersection with the SR-210.

The Proposed Project is in the vicinity of the Alder Avenue overcrossing with westbound (WB) and eastbound (EB) entrance and exit ramps at the SR-210. The Alder Avenue overcrossing (PM R15.93, Bridge Number 54-0649) was built in 2005. The entire structure now measures approximately 92 feet in width and 240 feet in length.

The interchange is currently a Type L-2 spread diamond interchange. The existing ramps terminate at Alder Avenue and the ramps termini are signal controlled. The entrance ramps are metered two-lane facilities, while the exit ramps are single lanes that transition into a dual lane at the interchange. The existing development in the immediate vicinity of the interchange is a gas station. Development to the north and south of the interchange consists mostly of industrial buildings and warehouses.

Alder Avenue at this location is not a bicycle facility, but does have full pedestrian access via sidewalks, crosswalks, and curb ramps.

### **3. PURPOSE AND NEED**

#### **Purpose:**

The purpose of the proposed project is to:

- Relieve congestion and improve traffic operations on Alder Avenue between Casmalia Street and Renaissance Parkway near the SR-210 interchange
- Address increased travel associated with existing and planned development anticipated in the City of Rialto, including the Renaissance Community development to the south of SR-210

#### **Need:**

The proposed project is needed to address the following deficiencies:

- The forecast increased traffic volumes, due to existing and planned development, in conjunction with deficient left and right-turn storage length from Alder Avenue to SR-210 are expected to result in the deterioration of the traffic operations to level of service F by the design year 2040

### **4. TRAFFIC ASSESSMENT**

A Traffic Operations Analysis has been prepared for the Proposed Project to examine the LOS for expected design year 2040. The analysis of existing conditions was based on the traffic volumes obtained from traffic counts conducted for the Renaissance Specific Plan Amendment Traffic Impact Analysis. Intersection traffic volumes were developed for the design year using the 2040 San Bernardino Transportation Analysis Model (SBTAM). Peak-hour turning movement volumes were developed using raw traffic data from the SBTAM base and future year model runs were post-processed using the National Cooperative Highway Research Program (NCHRP) 255 methodologies. The traffic model was run using a base year of 2012 and a forecast year 2040.

The Traffic Operations Analysis will be used as a reference to support the purpose and need for this Feasibility Study Report. Per the Southern California Association of Governments (SCAG) the Metropolitan Transportation Organization (MPO), guidelines for AM and PM peak hour percentages were factored as the incremental changes in peak hour volumes were developed. Forecast growth between the year 2015 and 2040 ground counts were surmised using an assumed incremental growth in approach and departure volumes between 2012 and 2040. A factor of 0.89 (i.e., 25/28) was used since the desired study period was 25 years of the available 28-year span. This resulted in post-processed 2040 link volumes. While reviewing the SBTAM, it was observed that the model did not include some land uses. To correct this, trips to those projects were added to the 2040 post-processed traffic volumes.

Existing lane geometrics and existing traffic volumes were used to calculate the level of service for existing conditions. The results of the LOS analysis for existing conditions with and without Proposed Project can be found in the table below.

**Table 1: Existing Levels of Service**

Intersection	LOS Standard	Control	Without Project				With IC Improvements			
			AM Peak Hour		PM Peak Hour		AM Peak Hour		PM Peak Hour	
			Delay	LOS	Delay	LOS	Delay	LOS	Delay	LOS
1 . Alder Avenue(NS)/ Casmalia Street(EW)	D	Signal	33.4	C	28.7	C	23.6	C	20.9	C
2 . Alder Avenue(NS)/ SR-210 WB Ramps(EW)	D	Signal	81.2	F *	31.9	C	11.1	B	10.5	B
3 . Alder Avenue(NS)/ SR-210 EB Ramps(EW)	D	Signal	14.3	B	15.6	B	12.7	B	14.4	B
4 . Alder Avenue(NS)/ Easton St-Renaissance Pkwy(EW)	D	Signal	21.3	C	18.5	B	16.4	B	15.2	B

**Notes:**

\* Exceeds LOS Standard

LOS = Level of Service

Source: Translutions, 2017

Currently, the majority of the examined intersections operate at an acceptable LOS, with the exception being the Alder Ave(NS)/ SR-210 WB Ramps(EW) intersection which operates below standards. As the table shows, implementing the planned improvements will enhance the LOS for existing traffic conditions.

The LOS for design year 2040 was determined using forecast growth from the traffic analysis. The table below shows the LOS for 2040 with and without Proposed Project.

**Table 2: Year 2040 Levels of Service**

Intersection	LOS Standard	Control	Without Project				With IC Improvements			
			AM Peak Hour		PM Peak Hour		AM Peak Hour		PM Peak Hour	
			Delay	LOS	Delay	LOS	Delay	LOS	Delay	LOS
1 . Alder Avenue(NS)/ Casmalia Street(EW)	D	Signal	69.2	E *	>100	F *	33.6	C	49.3	D
2 . Alder Avenue(NS)/ SR-210 WB Ramps(EW)	D	Signal	93	F *	>100	F *	23.4	C	29.2	C
3 . Alder Avenue(NS)/ SR-210 EB Ramps(EW)	D	Signal	52	D	93.7	F *	17.2	B	15.1	B
4 . Alder Avenue(NS)/ Easton St-Renaissance Pkwy(EW)	D	Signal	70.2	E *	>100	F *	21.9	C	31.2	C

**Notes:**

\* Exceeds LOS Standard

LOS = Level of Service

Source: Translutions, 2017

As Table 2 demonstrates, under design year 2040 conditions, all intersections operate at an unsatisfactory LOS, except for the intersection of Alder/SR-210 Eastbound Ramps, which operates at a LOS of D in the AM peak hour. Construction of the proposed project will alleviate traffic congestions and improve intersection operations to a satisfactory LOS.

A Queue Analysis was performed to determine the intersection movements, that are experiencing and will experience back-up, due to deficiency in storage length. Table 3 and 4 below present the data in the analysis.

**Table 3: Queue Analysis for No Improvements**

Intersection	Movement	Storage Length (In Feet)	Existing		Year 2040 Without Project	
			AM Peak Hour	PM Peak Hour	AM Peak Hour	PM Peak Hour
			Queue Length <sup>1</sup>	Queue Length <sup>1</sup>	Queue Length <sup>1</sup>	Queue Length <sup>1</sup>
1 . Alder Ave/Casmalia Street	NBL	115	87	<b>121</b>	<b>187</b>	<b>294</b>
	SBL	220	16	42	66	69
	SBR	800	13	0	0	0
	EBL	300	24	31	50	60
	EBR	250	31	74	57	244
	WBL	300	<b>488</b>	271	<b>581</b>	<b>566</b>
	WBR	600	0	0	0	0
2 . Alder Ave/SR-210 Westbound Ramps	NBL	235	227	182	<b>324</b>	<b>572</b>
	WBL	600	185	181	480	546
3 . Alder Ave/SR-210 Eastbound Ramps	SBL	225	79	140	57	119
	EBR	600	53	49	<b>671</b>	<b>623</b>
4 . Alder Ave/Easton St-Renaissance Pkwy	NBL	115	48	47	91	88
	NBR	100	0	0	0	75
	SBL	275	66	14	<b>375</b>	<b>293</b>
	SBR	400	0	0	5	54
	EBL	315	72	63	153	<b>351</b>
	EBR	150	0	13	9	19
	WBL	315	96	81	105	122

**Notes:**

Bold = Exceeds storage length

<sup>1</sup>Queues reported are 95th Percentile queue lengths per movement in feet.

\* The NBT queue will be unaffected by the right turn queue as the NBT queue is &lt;50 feet.

Source: Translutions, 2017

In Table 3, under existing conditions, the Alder Ave/Casmalia Street west bound left turn in the AM peak hour and north bound left turn in the PM peak hour experience a

queueing length greater than the available storage length. This will cause back up and congestion in other lanes as well as previous intersections. Furthermore, under design year 2040, conditions for these two turns further deteriorate, and other intersections will experience similar complications.

**Table 4: Queue Analysis for Build Alternative**

Intersection	Movement	Storage Length (In Feet)	Existing With Project		Year 2040 With Project	
			AM Peak Hour	PM Peak Hour	AM Peak Hour	PM Peak Hour
			Queue Length <sup>1</sup>	Queue Length <sup>1</sup>	Queue Length <sup>1</sup>	Queue Length <sup>1</sup>
1 . Alder Ave/Casmalia Street	NBL	170	39	47	72	103

	SBL	220	23	38	59	69
	SBR	800	0	0	0	0
	EBL	300	22	28	39	60
	EBR	250	33	47	52	243
	WBL	300	174	117	202	227
2 . Alder Ave/SR-210 Westbound Ramps	NBL	260	101	101	39	50
	SBR*	125	0	0	265	289
	WBL	600	82	82	170	197
3 . Alder Ave/SR-210 Eastbound Ramps	NBR	125	1	2	11	74
	SBL	125	73	73	41	88
	EBL	600	167	167	360	354
	EBR	600	45	45	277	247
4 . Alder Ave/Easton St-Renaissance Pkwy	NBL	115	44	43	82	88
	NBR	100	0	0	0	98
	SBL	200	169	13	178	153
	EBL	315	64	57	120	303
	EBR	50	0	0	3	18
	WBL	315	86	74	94	122
	WBR	315	25	0	55	197

**Notes:**

**Bold** = Exceeds storage length

<sup>1</sup>Queues reported are 95th Percentile queue lengths per movement in feet.

\* The NBT queue will be unaffected by the right turn queue as the NBT queue is <50 feet.

Source: Translutions, 2017

With the Build Alternative, for existing conditions no queuing lengths will be greater than storage length, which will improve traffic operation in the area. For future conditions, most queuing lengths will be acceptable, with the only exception being the Alder Ave/SR-210 Westbound Ramps, which will have a greater queuing length in the AM and PM peak hours, than the available storage length.

Per the data analyzed in the Traffic Operations Analysis, improvements must be implemented to Alder Avenue to allow it to function efficiently and safely. Failure to implement these improvements will cause the LOS for the area to deteriorate. This will cause delays and operational challenges in the future.

The proposed improvements will enhance the LOS for the area and allow the intersections mentioned above to function with more efficiency. Furthermore, forecast growth for design year 2040 traffic conditions are regulated to provide a satisfactory LOS.

## 5. DEFICIENCIES

As illustrated in the Traffic Operations Analysis, the existing roadway system along Alder Avenue does not provide sufficient turning and through movements onto SR-210 and intersections in the immediate vicinity to serve forecasted 2040 travel demands. Due to the construction of new communities, such as the Renaissance Community project, and growth of industry in the area, transportation and economic demand will increase. If this demand is not addressed, traffic operations will continually deteriorate until the LOS for the area reaches an unsatisfactory level. To address this demand, improvements will need to be implemented in a timely manner.

The proposed project satisfies the requirements to accommodate regional growth and improve the LOS. Without the project, conditions will continue to worsen, causing traffic congestion and major delays at most of the intersections along Alder between Casmalia Street and Renaissance Parkway. Furthermore, improvements that are delayed to a later date will experience a higher cost and a complicated construction process due to the growth in the region.

## 6. ALTERNATIVE

The Build alternative proposes modifications to the existing spread diamond interchange, including improvements to Alder Avenue and the SR-210 ramps through restriping and widening. Improvements include widening southbound Alder Avenue to include a right turn lane onto westbound on-ramp; restriping to add a second left turn lane onto Renaissance Parkway; restriping to add a second left turn lane onto the EB on-ramp; and adding a shared thru lane. Northbound Alder Avenue will also be widened to provide right turn lanes onto Casmalia Street and the eastbound on-ramp. Additionally, northbound Alder Avenue will be restriped to add a second left turn lane onto Casmalia Street. The westbound off-ramp will be widened to provide a second left turn lane, while the eastbound off-ramp will be widened to provide a right turn lane. See attachment A for Build Alternative Plan Layout.

The Build Alternative may require additional right-of-way (ROW) in the form of temporary construction easements. Further analysis will be completed during the next project development phases to determine and document any ROW needs.

The following engineering technical reports are anticipated for the Build Alternative during the PA/ED phase of the Proposed Project:

- Preliminary Drainage Reports to address existing and proposed hydrology and hydraulic designs.
- Preliminary Materials and Geotechnical Reports
- Life-Cycle Cost Analysis for pavement design
- Right of Way Data sheets
- Traffic Forecasting
- Traffic Analyses

- Traffic Management Plan Data Sheets

**Table 3: Design Standards Risk Assessment**

Design Standard from Highway Design Manual Tables 82.1A & 82.1B	Probability of Design Exception Approval (None, Low, Medium, High,)
<b>Standard for Shoulder Width with Gutter Pan</b> HDM Index (308.1)	Medium
<b>Distance Between Ramp intersection and local street intersection</b> HDM Index (504.3)	High

Mandatory Design Exceptions Features:

1. Standard Shoulder Width, HDM Index (308.1) – The HDM requires that if gutter pans are used, the minimum shoulder width shall be 3 feet wider than the gutter pan being used. However, at several areas in the proposed project the shoulder width is 3 feet including the gutter pan. This is due to a potential impact to right-of-way and an increase in cost.
2. Location and Design of Ramp Intersections on the Crossroads, HDM Index (504.3), Distance between ramp intersection and local street intersection – The HDM states that the distance between a ramp intersection and a local street intersection shall be at least 400 ft. Currently, both the north-end and south-end of the project do not meet this requirement. This is an existing condition and changes will require major realignment.

**7. RIGHT-OF-WAY****Utilities:**

A list of potential utilities in and around the Proposed project was created using Alder Avenue as-built plans.

<u>Utility</u>	<u>Owner</u>
Cable	AT&T
Electrical	Southern California Edison
Water	Fontana Water Company

To verify whether the utilities listed above are still within limits, a dig alert search will be used. Utility companies will be contacted to provide facility maps.

## 8. COST ESTIMATE

The preliminary cost estimate for the Proposed Project is included as attachment 1. The table below summarizes the capital outlay cost of the project.

**Table 4: Capital Outlay Project Estimate**

<b>SUMMARY OF PROJECT COST ESTIMATE</b>		
TOTAL ROADWAY ITEMS		\$2,217,000
TOTAL STRUCTURE ITEMS		\$110,000
SUBTOTAL CONSTRUCTION COSTS		\$2,327,000
TOTAL RIGHT OF WAY ITEMS*		\$0
TOTAL PROJECT CAPITAL OUTLAY COSTS		\$2,327,000

\* ROW and Utility Cost not included

Per the guidance in the PDPM Chapter 9, Article 8, it is anticipated that the project will follow the Permit Engineering Evaluation Report (PEER) process since the estimated cost is below \$3M.

## 9. DELIVERY SCHEULE

# memorandum

DATE: August 29, 2017  
TO: Jamal Salman, P.E.  
FROM: Sandipan Bhattacharjee, P.E., AICP  
SUBJECT: SR-210-Alder Avenue Interchange Feasibility Study Report  
Traffic Operations Analysis

Translutions, Inc. (Translutions) is pleased to provide this memorandum discussing the volume development and operations analysis for the Feasibility Study Report for the State Route 210 (SR-210)-Alder Avenue interchange located in the City of Rialto. Since this analysis is part of a feasibility study report, the analysis focuses on the Alder Avenue corridor. Therefore, the following intersections were evaluated:

## Intersections

1. Alder Avenue/Casmalia Street;
2. Alder Avenue/SR-210 Westbound Ramps;
3. Alder Avenue/SR-210 Eastbound Ramps; and
4. Alder Avenue/Renaissance Parkway.

## VOLUME DEVELOPMENT

### Existing Conditions

The analysis of existing conditions was based on the traffic volumes obtained from traffic counts conducted for the Renaissance Specific Plan Amendment Traffic Impact Analysis. The traffic counts are from 2015 and include vehicle classification counts. Figure 1 shows the existing turning volumes during the a.m. and p.m. peak hours at study intersections. Figure 2 shows that existing passenger vehicle volumes, and Figure 3 shows the existing truck traffic volumes. Traffic volumes were converted to PCEs using SBCTA conversion factors and balanced along the corridor. Figure 4 shows the balanced PCE traffic volumes.

**Future Volumes:** The intersection traffic volumes for design year conditions were developed using the 2040 San Bernardino Transportation Analysis Model (SBTAM) base year and future year model networks. Raw traffic model data from the SBTAM base and future year model runs were post-processed using National Cooperative Highway Research Program (NCHRP) 255 methodologies to develop peak-hour turning movement volumes at each study area intersection. The base year for the traffic model is 2012 and the forecast year is 2040. The difference between the modeled 2012 and 2040 peak period directional arterial traffic volumes (for each intersection approach and departure) was identified from loaded network model plots. This difference defines the growth in traffic over the 28-year period. This incremental growth in peak period approach and departure volumes was factored to develop the incremental change in peak hour volumes. The SBTAM uses a three-hour a.m. peak period and a four-hour p.m. peak period. SCAG, the regional Metropolitan Transportation Organization (MPO) has established that the a.m. peak hour comprises 38 percent of the a.m. peak period and that the p.m. peak hour comprises 28 percent of the p.m. peak period. Therefore, the incremental changes in peak period volumes were multiplied by the appropriate factor to develop incremental changes in peak hour volumes. The incremental growth in approach and departure volumes between 2012 and 2040 was factored to reflect the forecast growth between the year of the ground counts (2015) and 2040. For this purpose, linear growth between 2012 and forecast 2040 (and beyond) was assumed. Since the increment between 2015 and 2040 is 25 years of the 28-year time span, a factor of 0.89 (i.e., 25/28) was used. This forecast growth in approach and departure volumes were added to the 2015 ground counts, resulting in post-processed 2040 link volumes.

Year 2040 intersection turn volumes were developed using existing turn volumes and the future approach and departure volumes, based on the methodologies contained in National Cooperative Highway Research Program Report (NCHRP) 255: Highway Traffic Data for Urbanized Area Project Planning and Design (Transportation Research Board, December 1982).

Upon review of the SBTAM, it was observed that some land uses were not included in the model. Trips for those projects were added to the 2040 post processed traffic volumes.

Year 2040 traffic volumes are shown on Figure 5. Figure 6 shows that year 2040 passenger vehicle volumes, and Figure 7 shows the year 2040 truck traffic volumes. Traffic volumes were converted to PCEs using SBCTA conversion factors and balanced along the corridor. Figure 8 shows the balanced PCE traffic volumes.

## OPERATIONS ANALYSIS

Level of service (LOS) is a measure of the quality of operational conditions within a traffic stream, and is generally expressed in terms of such measures as speed and travel time, freedom to maneuver, traffic interruptions, and comfort and convenience. Levels range from A to F, with LOS A representing excellent (free-flow) conditions and LOS F representing extreme congestion. The analysis was conducted according to the Highway Capacity Manual 6<sup>th</sup> Edition (HCM) delay methodologies, which is described in the Highway Capacity Manual (Transportation Research Board, Washington, D.C., December 2016). Under the HCM methodology, LOS for signalized intersections is based on the average delay experienced by vehicles traveling through an intersection. Table A presents a brief description of each level of service letter grade.

Table A: Intersection LOS Criteria

LOS	Description of Drivers' Perception and Traffic Operation	Delay in Seconds Unsignalized	Delay in Seconds Signalized
A	This level is typically assigned when the volume-to-capacity ratio is low and either progression is exceptionally favorable or the cycle length is very short. If it is due to favorable progression, most vehicles arrive during the green indication and travel through the intersection without stopping.	$\leq 10$	$\leq 10$
B	This level is assigned when the volume-to-capacity ratio is low and either progression is highly favorable or the cycle length is short. More vehicles stop than with LOS A.	$> 10 \text{ and } \leq 15$	$> 10 \text{ and } \leq 20$
C	This level is typically assigned when progression is favorable or the cycle length is moderate. Individual cycle failures (i.e., one or more queued vehicles are not able to depart as a result of insufficient capacity during the cycle) may begin to appear at this level. The number of vehicles stopping is significant, although many vehicles still pass through the intersection without stopping.	$> 15 \text{ and } \leq 25$	$> 20 \text{ and } \leq 35$
D	This level is typically assigned when the volume-to-capacity ratio is high and either progression is ineffective or the cycle length is long. Many vehicles stop and individual cycle failures are noticeable.	$> 25 \text{ and } \leq 35$	$> 35 \text{ and } \leq 55$
E	This level is typically assigned when the volume-to-capacity ratio is high, progression is unfavorable, and the cycle length is long. Individual cycle failures are frequent.	$> 35 \text{ and } \leq 50$	$> 55 \text{ and } \leq 80$
F	This level is typically assigned when the volume-to-capacity ratio is very high, progression is very poor, and the cycle length is long. Most cycles fail to clear the queue.	$> 50$	$> 80$

Source: *Highway Capacity Manual, 2010*

The City of Rialto and Caltrans both endeavor to maintain LOS D as the minimum level of service standard for intersection and interchange operations.

**Existing Levels of Service.** The levels of service for existing conditions were calculated by using existing lane geometrics and existing traffic volumes. Existing lane geometrics are shown on Figure 9. Under existing conditions, all intersections with the exception of Alder Avenue/Casmalia Street operate at acceptable levels of service. Table B shows the existing LOS at study intersections. Figure 10 shows the lane geometrics with the proposed interchange improvements, as well as improvements identified in the Renaissance Specific Plan Amendment for intersections along Casmalia Street and Renaissance Parkway. With construction of the proposed interchange improvements, all intersections will operate at satisfactory levels of service.

**Year 2040 Levels of Service.** Under year 2040 conditions, all intersections operate at unsatisfactory levels of service, except the intersection of Alder Avenue/SR-210 Eastbound Ramps. Table C shows the existing LOS at study intersections. With construction of the proposed interchange improvements, and improvements identified in the Renaissance Specific Plan Amendment for Casmalia Street and Renaissance Parkway, all intersections will operate at satisfactory levels of service.

**Queuing Analysis.** A queuing analysis was conducted to evaluate traffic operations under existing and 2040 conditions. Table D shows the results of this analysis. Under existing conditions, queues exceed available storage space at the intersection of Alder Avenue/Casmalia Street. Under existing plus project conditions all queues are anticipated to fit available storage space. Under Year 2040 without project conditions, all intersections have at least one turning movement where queues are exceeded, blocking through traffic. Under 2040 with project conditions, the southbound right turn queue at the intersection of Alder Avenue/SR-210 Westbound Ramps are forecast to exceed available space – but this will not block through traffic as the through traffic volume is minimal and southbound through queues are minimal (less than 50 feet).

<sup>1</sup> Modeled base year (2012) to modeled future year (2040) conditions represent 28 years of traffic growth. Since it is 26 years from 2014 (base count conditions) to 2040, the 'new link volume' represents 92.86% of the modeled growth.

<sup>1</sup> Modeled base year (2012) to modeled future year (2040) conditions represent 28 years of traffic growth. Since it is 26 years from 2014 (base count conditions) to 2040, the 'new link volume' represents 92.86% of the modeled growth.

**Intersection Summary**

- ~ Volume exceeds capacity, queue is theoretically infinite.  
Queue shown is maximum after two cycles.
- # 95th percentile volume exceeds capacity, queue may be longer.  
Queue shown is maximum after two cycles.
- m Volume for 95th percentile queue is metered by upstream signal.
